Co-Operation Grows Apace in Maritime Provinces

In Few Years Farmers Have Developed Many Progressive Co-operative Organizations---Many Lines are Covered

Co-operation is making marked progress in the Maritime Provinces among farmers. A few years experience has demonstrated that along certain lines co-operation is not only feasible, but profitable. New lines of co-operative work have been opening up continually, until now the amount of business transacted by farmers in a co-operative way runs into hundreds of thousands of dollars, aye, the total may be measured in millions. And the game is only in its infancy. Everywhere co-operation is being talked and adopted by farmers and the experience of those interested has in many cases been gratifying.

Of course there have been failures. The co-operative store has in too many instances proved unprofitable and losses followed failure to bring to bear on many undertakings of this character ordinary business precaution. Success in co-operation, like any other venture, must be founded on sound, common sense methods. To properly manage a business, one must have a knowledge of business and in the case of a co-operative retail business this means much. The man who would make a business "go" must be versed in buying and selling. He must know goods and just what goods he can sell in his community. He must be able to take advantage of markets both in buying and selling. He should be a "keen" commercial student and have the capacity to make friends for his business. A co-operative store should be up-to-date in every way. It should be clean and attractive, and should be the centre of trade in its locality. Unfortunately, not only have some of these conditions been found wanting in connection with the management of some co-operative business ventures, but every one has been missing and the result has been disaster with a capital D.

However, this is the dark side of the cloud. There has been success achieved in co-operation in all three provinces by the sea, New Brunswick, Nova Scotia and Prince Edward Island. In New Brunswick, the Agricultural Societies United have in the past few years distributed hundreds of thousands of dollars worth of fertilizers through the agricultural societies of the province. This has resulted in the saving of thousands of dollars to farmers who use fertilizers. It has been a success from the start and has brought home to hundreds and thousands, the advantages of co-operation. And still there are thousands of farmers who are not yet alive to the usefulness of this splendid organization.

In Nova Scotia, we might mention the United Fruit Growers as the outstanding concern which has made a hit with co-operation. This strong organization started in to handle apples for its stockholders. The idea was to pack all apples at central warehouses, ensuring uniformity in sorting; to secure better ocean freights, better prices, cash remittances, etc. All these things were accomplished. The day when impecunious speculators might fleece the farmer was closed, and business on business principles was started and maintained. The United Fruit Growers, too, furnished their patrons with fertilizers. flour, feeds, germicides, etc., at cost. It has developed a business which is one of the big things in the agricultural life of the Annapolis and Cornwallis valleys and its ramifications are extending. It has succeeded.

In Prince Edward Island the P. E. I. Co-operative Egg and Poultry Association has established a record which it would be hard to excell. They have a splendid plant at Charlottetown. All eggs are handled with the greatest care. They are graded and sold on the highest market and the producers are given the benefit of sales service which is right up to date. On the Island, too, many other lines of produce are handled in the same way and the farmer there gets every dollar out of his produce that it is possible for him to get. The effect has been to revolutionize farm conditions in the progressive portions of the Island and to establish a firm faith in co-operation among many.

In a general way co-operation in the production of butter and cheese has been adopted in all three provinces. Under this system, there have been built up concerns which distribute to farmers every year over $100,000 each. They are giving back to their patrons every cent of profit that is earned by the plants. Not only that, but they have come to realize that excellence counts in the sale of their output and there is keen rivalry to be FIRST in the race for better methods and better finished products.

In Carleton county, New Brunswick, the United Farmers are making their bow to the public with a co-operative movement, which, with careful management may be expected to do much for its members. A warehouse has been established in Woodstock, and besides selling at wholesale rates to its members, the United Farmers hope to sell co-operatively potatoes and hay, which are the large items of produce in that section. They propose to get every dollar for the farmer that can be got and there seems to be no reason why success should not attend their efforts, quite as much as it has the movement inaugurated in Nova Scotia by the United Fruit Growers, or the Co-operative Egg and Poultry Association, of Prince Edward Island. Good management will be an essential but that can be had. In its infancy as yet, the progress of this newest venture among farmers will be watched with interest. Its success will mean much to the farmers of Carleton County, who can support it with profit to themselves.

Possibly the biggest thing in co-operation in the history of Canada was the handling of the wool production of 1918. A co-operative company formed early in the year undertook to sell co-operatively the wool production of all Canada. Although the organization was in its infancy, it sold practically the output of the country and it returned to the farmers more money for their wool than they had ever received before. Not only that, but the strength of the movement was such that when an effort was made to prohibit the export of wool, and thus restrict prices, the representatives of the wool producers were able to defeat that end and get the very best price available. It was a big demonstration of the efficiancy of co-operation and next year should see even greater success in connection with the sale of wool.

The Grain Growers, of the West, is another big success for farmers. That institution had many a hard row to hoe. All sorts of disappointments were encountered. The Grain Growers in one year lost a quarter of a million. Were they down-hearted? A little, perhaps, but they realized that all businesses must have losses as well as gains, and they stayed with the game to a finish. To-day the activities of the Grain Growers are widespread. The organization has assets of $6,000,000, which represents profits that have been made through co-operation. Of course there were big men at the helm, as there are to-day. The Grain Growers picked out big fellows to run their business and they paid big men's salaries. The present financial standing of the Grain Growers demonstrate satisfactorily the wisdom of getting a man to do a man's work. And besides being a big factor in the business life of the west, the Grain Growers must be reckoned with as the "big stick" in the public life of that country.

"Getting together" is just now the one thing that is engaging the attention of all classes in Canada. Wise men are realizing that after-the-war conditions will bring an entirely new outlook. And so they are preparing for the future. Labor unions are everywhere organizing as they have never done before. The manufacturers are getting closer together, in order that they may better meet the competition that will inevitably follow the war. Financial interests are uniting and building up institutions of immense strength. The returned soldiers and those in France and England see the wisdom of union and they are laying the foundation of a society which will lay down their demands upon this country. Retail merchants are everywhere working side by side. Prices are being fixed at which goods may be sold. If the prices are not adherred to, the merchant who transgresses finds himself without the goods to dispose of. Union is everywhere in evidence. It is recognized as the only modern method of accomplishing things.

And so the time is ripe for farmers of the Maritime Provinces to get together and see to it that they, too, organize. They can by co-operation make money, just as other united bodies are making money. There is everywhere in the cities a demand for increased wages and the control of food prices. That is to say, the farmers are invited to take less for their crops and pay more for everything they buy. If every other interest in Canada is to unite to impose their views upon parliament and farmers alone are content to stand aloof, what will the end be? This is the get-together period and the longer the getting together is delayed, the worse it will be for the mob and the better the pickings will be for the well led and well united organizations of Canada.

The Maritime Farmer has done something to encourage co-operation. The effort was small and not at all on the scale that it might have been under normal conditions. But it has helped a good many farmers get feeds at prices much lower than their less fortunate associates paid for them. Unfortunately the war has so disarranged things that it is impossible to do business under ordinary circumstances. But the day is coming when things will be adjusted and every farm community in the Maritime Provinces should be ready to take advantage of the return of those conditions.

If farmers are to take advantage of their opportunities they must co-operate. It is only a short time since it was impossible to buy fertilizers co-operatively. The big manufacturers at one time would not sell direct. But to-day the best available business in the country, the spot-cash kind is being handled by the farmers themselves and they are saving thousands of dollars. How did they win recognition in the fertilizer market? By co-operation. The manufacturers found out that the farmers had real money to spend and

Co-Operation Grows Apace in Maritime Provinces

In Few Years Farmers Have Developed Many Progressive Co-operative Organizations---Many Lines are Covered

Co-operation is making marked progress in the Maritime Provinces among farmers. A few years experience has demonstrated that along certain lines co-operation is not only feasible, but profitable. New lines of co-operative work have been opening up continually, until now the amount of business transacted by farmers in a co-operative way runs into hundreds of thousands of dollars, aye, the total may be measured in millions. And the game is only in its infancy. Everywhere co-operation is being talked and adopted by farmers and the experience of those interested has in many cases been gratifying.

Of course there have been failures. The co-operative store has in too many instances proved unprofitable and losses followed failure to bring to bear on many undertakings of this character ordinary business precaution. Success in co-operation, like any other venture, must be founded on sound, common sense methods. To properly manage a business, one must have a knowledge of business and in the case of a co-operative retail business this means much. The man who would make a business "go" must be versed in buying and selling. He must know goods and just what goods he can sell in his community. He must be able to take advantage of markets both in buying and selling. He should be a "keen" commercial student and have the capacity to make friends for his business. A co-operative store should be up-to-date in every way. It should be clean and attractive, and should be the centre of trade in its locality. Unfortunately, not only have some of these conditions been found wanting in connection with the management of some co-operative business ventures, but every one has been missing and the result has been disaster with a capital D.

However, this is the dark side of the cloud. There has been success achieved in co-operation in all three provinces by the sea, New Brunswick, Nova Scotia and Prince Edward Island. In New Brunswick, the Agricultural Societies United have in the past few years distributed hundreds of thousands of dollars worth of fertilizers through the agricultural societies of the province. This has resulted in the saving of thousands of dollars to farmers who use fertilizers. It has been a success from the start and has brought home to hundreds and thousands, the advantages of co-operation. And still there are thousands of farmers who are not yet alive to the usefulness of this splendid organization.

In Nova Scotia, we might mention the United Fruit Growers as the outstanding concern which has made a hit with co-operation. This strong organization started in to handle apples for its stockholders. The idea was to pack all apples at central warehouses, ensuring uniformity in sorting; to secure better ocean freights, better prices, cash remittances, etc. All these things were accomplished. The day when impecunious speculators might fleece the farmer was closed, and business on business principles was started and maintained. The United Fruit Growers, too, furnished their patrons with fertilizers. flour, feeds, germicides, etc., at cost. It has developed a business which is one of the big things in the agricultural life of the Annapolis and Cornwallis valleys and its ramifications are extending. It has succeeded.

In Prince Edward Island the P. E. I. Co-operative Egg and Poultry Association has established a record which it would be hard to excell. They have a splendid plant at Charlottetown. All eggs are handled with the greatest care. They are graded and sold on the highest market and the producers are given the benefit of sales service which is right up to date. On the Island, too, many other lines of produce are handled in the same way and the farmer there gets every dollar out of his produce that it is possible for him to get. The effect has been to revolutionize farm conditions in the progressive portions of the Island and to establish a firm faith in co-operation among many.

In a general way co-operation in the production of butter and cheese has been adopted in all three provinces. Under this system, there have been built up concerns which distribute to farmers every year over $100,000 each. They are giving back to their patrons every cent of profit that is earned by the plants. Not only that, but they have come to realize that excellence counts in the sale of their output and there is keen rivalry to be FIRST in the race for better methods and better finished products.

In Carleton county, New Brunswick, the United Farmers are making their bow to the public with a co-operative movement, which, with careful management may be expected to do much for its members. A warehouse has been established in Woodstock, and besides selling at wholesale rates to its members, the United Farmers hope to sell co-operatively potatoes and hay, which are the large items of produce in that section. They propose to get every dollar for the farmer that can be got and there seems to be no reason why success should not attend their efforts, quite as much as it has the movement inaugurated in Nova Scotia by the United Fruit Growers, or the Co-operative Egg and Poultry Association, of Prince Edward Island. Good management will be an essential but that can be had. In its infancy as yet, the progress of this newest venture among farmers will be watched with interest. Its success will mean much to the farmers of Carleton County, who can support it with profit to themselves.

Possibly the biggest thing in co-operation in the history of Canada was the handling of the wool production of 1918. A co-operative company formed early in the year undertook to sell co-operatively the wool production of all Canada. Although the organization was in its infancy, it sold practically the output of the country and it returned to the farmers more money for their wool than they had ever received before. Not only that, but the strength of the movement was such that when an effort was made to prohibit the export of wool, and thus restrict prices, the representatives of the wool producers were able to defeat that end and get the very best price available. It was a big demonstration of the efficiancy of co-operation and next year should see even greater success in connection with the sale of wool.

The Grain Growers, of the West, is another big success for farmers. That institution had many a hard row to hoe. All sorts of disappointments were encountered. The Grain Growers in one year lost a quarter of a million. Were they down-hearted? A little, perhaps, but they realized that all businesses must have losses as well as gains, and they stayed with the game to a finish. To-day the activities of the Grain Growers are widespread. The organization has assets of $6,000,000, which represents profits that have been made through co-operation. Of course there were big men at the helm, as there are to-day. The Grain Growers picked out big fellows to run their business and they paid big men's salaries. The present financial standing of the Grain Growers demonstrate satisfactorily the wisdom of getting a man to do a man's work. And besides being a big factor in the business life of the west, the Grain Growers must be reckoned with as the "big stick" in the public life of that country.

"Getting together" is just now the one thing that is engaging the attention of all classes in Canada. Wise men are realizing that after-the-war conditions will bring an entirely new outlook. And so they are preparing for the future. Labor unions are everywhere organizing as they have never done before. The manufacturers are getting closer together, in order that they may better meet the competition that will inevitably follow the war. Financial interests are uniting and building up institutions of immense strength. The returned soldiers and those in France and England see the wisdom of union and they are laying the foundation of a society which will lay down their demands upon this country. Retail merchants are everywhere working side by side. Prices are being fixed at which goods may be sold. If the prices are not adherred to, the merchant who transgresses finds himself without the goods to dispose of. Union is everywhere in evidence. It is recognized as the only modern method of accomplishing things.

And so the time is ripe for farmers of the Maritime Provinces to get together and see to it that they, too, organize. They can by co-operation make money, just as other united bodies are making money. There is everywhere in the cities a demand for increased wages and the control of food prices. That is to say, the farmers are invited to take less for their crops and pay more for everything they buy. If every other interest in Canada is to unite to impose their views upon parliament and farmers alone are content to stand aloof, what will the end be? This is the get-together period and the longer the getting together is delayed, the worse it will be for the mob and the better the pickings will be for the well led and well united organizations of Canada.

The Maritime Farmer has done something to encourage co-operation. The effort was small and not at all on the scale that it might have been under normal conditions. But it has helped a good many farmers get feeds at prices much lower than their less fortunate associates paid for them. Unfortunately the war has so disarranged things that it is impossible to do business under ordinary circumstances. But the day is coming when things will be adjusted and every farm community in the Maritime Provinces should be ready to take advantage of the return of those conditions.

If farmers are to take advantage of their opportunities they must co-operate. It is only a short time since it was impossible to buy fertilizers co-operatively. The big manufacturers at one time would not sell direct. But to-day the best available business in the country, the spot-cash kind is being handled by the farmers themselves and they are saving thousands of dollars. How did they win recognition in the fertilizer market? By co-operation. The manufacturers found out that the farmers had real money to spend and

The Prince Edward Island Exhibition

The terrible catastrophe which occurred in the city of Halifax last December, precluded the holding of an exhibition in that city this fall. The explosion racked the exhibition buildings from turret to foundation stone. Homes were erected for the homeless on the exhibition grounds, and until such a time as proper repairs can be effected and ample housing accommodation in other sections of the city is procurable, the holding of an exhibition in the garrison city is out of the question.

The New Brunswick Department of Agriculture did not favor the holding of an inter-provincial exhibition in that province this year, and consequently they did not vote a grant for exhibition purposes.

The Prince Edward Island Department of Agriculture did not vote a grant for the annual inter-provincial exhibition at Charlottetown this year, but encouraged by a substantial grant from the Dominion Live Stock Department, the Charlottetown Driving Park and Exhibition Association, under whose auspices the exhibition is held, decided to carry on their annual fair.

This progressive association found it necessary to reduce the prizes offered this year to the extent of from 25 to 33 per cent. and consequently the amounts offered in the various sections were not so attractive to exhibitors as were the sums offered in previous years.

Frequent rain storms, protracted the harvesting season so that grain which was cut and stooked a couple of weeks ago, was still in the fields at exhibition time, September 24th to 27th inclusive. Under conditions of this kind a farmer could hardly justify his absence from the farm and possibly miss taking advantage of getting necessary work performed whenever the weather conditions were favorable.

The high cost of feed, the scarcity of labor, the lack of opportunity to exhibit at only one exhibition did not warrant the stock breeders an opportunity to get money spent on high fitting back, and consequently the major portion of the live stock that was shown at the fair was in good, thrifty, field fit, and minus the bloom in many instances that goes with special fitting for exhibition purposes.

The weather man did his best to make matters disagreeable for the management, exhibitors and visitors alike by furnishing damp, cold days with but little sunshine, yet the attendance records were particularly good.

The main building held an exceptionally fine exhibit representative of the work carried on by the Dominion Experimental Farms. A careful study of this educational display revealed many features of interest to the visitors, the majority of whom commented freely and favorably upon the artistic arrangement and truths silently yet forcibly presented.

The Entomological Division also put up a very instructive display of the plant enemies that the farmers have to combat. Ways and means to effectively fight these pests were explained by the officers in charge, and by placards judiciously placed where they would draw the attention of the public to the best advantage.

The Dominion Live Stock Branch conducted a booth in which one could learn all about the co-operative marketing and proper care of wool.

Then there was a booth in which the proper handling of eggs from producer to consumer was cleverly shown in conjunction with an exhibit showing many tempting ways in which eggs may be used to help conserve meat products for our soldiers and their allies.

There was a very creditable display of July, August and September cheese from the majority of cheese factories operating in Prince Edward Island. Mr. Geo. Barr, who judged this display, said the quality was not quite so high as that of the cheese shown last year, and consequently the scoring was somewhat lower. This is a feature, however, which is characteristic of Canadian cheese this year. A list of the scoring of the cheese will be found in tabulated form elsewhere in this issue. The total score for the prize winning butter exhibits will be found in the published list of awards.

The roots, vegetables and grains made a small but select exhibit. Any shortage in this department will be more than compensated at the big Maritime Seed Fair which will be held in Summerside next December.

The fruit display was very creditable. Island grown fruit on exhibition was considerably supplemented by exhibitors from the Annapolis Valley, who went over with a line of their best apples.

The horse classes at Charlottetown were the slimmest in point of numbers that we have seen there for some years. The aged Clydesdale stallion class was the most outstanding feature of the horse show. In the ring were Baron Kelvin, Thorndale by Hiawatha, Dean of St. Cuthberts by Keppock Prince and Pan Baron and Baron Rossiter, both by Baron Kelvin. The noted prize winner Baron Kelvin went down to second place, Thorndale carrying off the coveted red and subsequently the diploma for best Clydesdale stallion, any age. Dean of St. Cuthberts came in for third money. The champion mare was by Baron Kelvin. The best foal of 1918 was by Thorndale.

Alex. McKay, Charlottetown, showed the majority of the Percherons in the ring. The male championship went to Ormeaux, shown in the three year old class by David Reid and son of Montague.

In the Standard bred class, Jas. W. McKinney carried off the coveted red in the aged stallion section, while further down the list stood Harvest Bells, Prince Marjor, Moko Jr., and Dingold in the order named.

A Parkwood, A Brazillian and A Darkwood stood in for first, second and third monies in the roadster section for mare or gelding, 4 years old and over.

The majority of the entries in the Carriage Class did not possess carriage horse breeding or quality. They were distinctly of roadster type. The prize list needs revision so that places may be provided where horses of roadster breeding may be shown to better advantage.

Beef Cattle

Shorthorns, Heresfords and Aberdeen Angus cattle made up the beef classes, all of which were out in creditable fit.

Horne Bros. showed their splendid herd of Blacks. G. L. Hayden was the only exhibitor of white faces.

J. M. Laird & Son of Kelvin Grove had the largest number of entries in the Shorthorn Class and carried off the most coveted prizes. Their first prize junior bull calf was sold at the close of the fair to go to Nova Scotia as a future herd header for A. N. Griffin's herd at New Minas.

J. S. Irving of Cherry Valley was Messrs. Laird's main competitor, with several other breeders whose winnings will be found elsewhere in this issue.

Dairy Cattle

The dairy cattle section did not show the number of entries of previous years. The biggest showing was made in the Ayrshire and Holstein classes. A. McRae & Sons, Easton Bros., Pope Noy, Edwin Reid, A. E. Ings, Vernon McMillan and W. R. Yonker exhibited Ayrshires. The male championship went to Easton Bros. on their aged bull, White Hill King of Hearts. A. McRae & Sons captured the female championship with their aged cow, Queenie II.

The battle royal in Holsteins was between the herds of W. M. Lea and W. J. Gibson & Son. The latter captured the coveted breeder's young herd prize, while both male and female championships went to the Lea herd on a two year old bull and an aged cow. The majority of the red ribbons went to the Lea herd. The Canadian Bank of Commerce special prize for best yearling heifer was won by Messrs. Gibson.

W. M. Stead had everything his own way in the Jersey Classes.

Roper Bros. had a similar walk over in the Guernsey sections.

The grade dairy cattle sections were well filled.

Swine

There was a splendid display of swine shown by H. R. Moase, Ernest Ings, S. C. Lane, Peter Brodie, Wallace Stead, Geo. Crockett, J. F. Roper, S. C. Stewart, G. W. Wood, A. H. Boswell, S. Holroyd and David Reid & Son. The Canadian Bank of Commerce Bronze Medal for best Yorkshire sow went to Geo. Crockett.

Sheep

The sheep classes at Charlottetown showed the care and attention Island sheep men are devoting to the maintenance of good flocks.

The only competition from outside sources came from Burden Goodwin, who was over with his Oxfords to vie with J. M. Laird & Son and A. H. Boswall. The majority of the choicest plums was captured by the mainland flock, but they had to fight every inch of the way.

The Canadian Bank of Commerce Bronze Medal for the best flock of sheep, any breed, was captured by Albert Boswall, with his splendid flock of Lincolns.

The poultry display was not very large, but of good quality.

The Judges were:—

Agricultural Products—S. J. Moore, Truro.

Dairy Products—Geo. Barr. Ottawa.

Heavy Horses—J. M. McCallum, Shakespeare, Ont.

Light Horses—Dr. J. A. Sinclair, Cannington, Ont.

Beef Cattle and Swine—Prof. G. E. Day, Guelph, Ont.

Dairy Cattle—B. A. Bull, Brampton, Ont.

Sheep—J. D. Brien, Bridgewater, Ont.

It is hoped that ere the next exhibition season arrives, Britain and her Allies will have entered Berlin and that a victorious peace will thus be consummated, so that the pendlum of economic conditions will begin to revert back towards the normal mark. The breeder who has read the foresight to be prepared for that day, will find ready sale for all his surplus stock and he who has the quality that can with good performance win out in the show ring, is assured of top notch prices. It will be well for all our breeders to prepare early to put forth their best efforts at the 1919 series of interprovincial exhibitions.

PRIZE WINNERS AT CHARLOTTETOWN

Carriage Horses

Stallion, 4 yrs. and upwards, carriage or coach—1, David Reid & Son, Montague, P. E. I.

Feeds are Still Advancing and Scarce

Agricultural Societies who Bougt Early Saved Money---Dealers Everywhere Without Feed---About Cotton Seed

Feed is very scarce. The Maritime Farmer has been warning its readers since last spring of the conditions that would prevail this fall. The prediction has been verified. Not only are feeds scarce, but the prices are steadily climbing. The wise agricultural societies have bought and those who have not bought will buy now. We will get you feeds and good feeds, if you want them. Dealers everywhere are complaining of the scarcity of feeds. Already they are offering molasses feeds of various kinds at prices which are higher than your society can buy for if the members will only get together. Our advice is to buy your feeds and buy them quickly.

About Cotton Seed

Cotton seed meal will possibly be available. Mark the word, POSSIBLY. The Food Controller, Mr, H. B. Thompson, is arranging for cotton seed, if it be possible to get license from the United States. The Maritime Farmer has asked for fifteen cars. Some of this is already spoken for. The balance will go to the first agricultural societies wanting it. THE PRICE WILL BE THE PRICE MR. THOMPSON PAYS FOR IT PLUS THE FREIGHT TO YOUR STATION, EXCHANGE AND OTHER CHARGES. We have asked for cotton seed meal of not less than 36 per cent. protein.

The prices of feeds are now:

COMPARATIVE ANALYSES

	Ground Special	Ground Standard	Molasses Hog Feed	Molasses Dairy (about)
Moisture	12.80	13.13	10.78	11.00

Mare or Gelding to be shown in carriage—1, W. M. Lea, Victoria; 2, Mills & Thorne; 3, J. J. McLeod.

Clydesdales

Registered in Canadian Clydesdale Drafthorse register.

Stallion, 4 yrs. old and upwards—1, Roper Bros.; 2, J. Norris Sinclair; 3, J. Heber Crosby.

tSallion, 3 yrs. old—1, J. F. McFarlane, Marshfield.

Stallion, 2 yrs. old—1, W. W. Crosby; 2, J. H. Crosby.

Stallion, 1 yr. old—1, Athol Roberts.

Filly, 3 yrs. old—1, W. W. Crosby.

Filly, 2 yrs. old—1, W. W. Crosby.

Filly, 1 yr. old—J. R. Munn.

Foal of 1918—1, Jas. F. Roper; 2, A. H. Boswall.

Mare, with foal at foot—1, A. H. Boswall; 2, Jas. Roper.

Champion Stallion, any age—Diploma, Roper Bros.

Champion Mare, any age—Diploma, A. H. Boswall.

Stallion and 2 of his get—Get not to exceed 3 yrs.—Diploma, J. Norris Sinclair.

Special Prizes iven by the Clydesdale Horse Association of Canada. Best Clydesdale Stallion, Imported or Canadian Bred—1, Roper Bros.

For the best Clydesdale Female, Imported or Canadian Bred—1, A. H. Boswall.

Best Clydesdale Stallion, Canadian Bred—1, W. W. Crosby.

Best Clydesdale Female, Canadian Bred—1, W. W. Crosby.

Best single mare or gelding in harness sired by a registered Clydesdale Stallion—1, J. L. Connolly.

Best. pr. of horses in harness (mares or geldings), sired by registered Clydesdale Stallion—1, J. Heber Crosby.

Percherons

All prizes in the Percheron Class went to A. H. McKay, Charlottetown, without competition, excepting in the three year old stallion class, when the first prize went to David Reid & Son, Montague.

Draft Horses

Not eligible for Registration

Filly, 3 years old—1, Goodwin Newson; 2, Neil McPhail; 3, Athol Judson.

Filly, 2 yrs. old—1, Herman Jones; 2, Wallace Wood.

Filly, 1 yr.—1, John Cummings.

Foal of 1918—1, Oliver Saunders.

Mare, with foal at foot—1, Oliver Saunders.

Pr. of Draft Horses not less than 1400 lbs. each, in harness or truck—2, Horne Bros.

Draft Horse or Gelding, not less than 1400 lbs.—1, J. L. Connolly; 2, Russell Abbott.

General Purpose Horses

Mare or Gelding, 4 yrs. and upwards—1, Wallace Wood; 2, Miss Lena Ferguson; 3, Thos. R. Beer.

Mare or Gelding, 3 yrs.—1, J. J. McLeod; 2, J. C. Stewart.

Brood Mare with foal at foot—1, W. H. Roberts; 2, B. H. Newson.

Matched team, Gelding or Mares, in harness, not to exceed 1300 lbs. each—1, G. D. Wright.

Walking Horses

Mare or Gelding shown in carriage—1, P. Byrne; 2, Donald McMillan; 3, J. J. McLeod.

Mare or Gelding, Draft, to be shown in cart or truck waggon—1, Oliver Saunders.

Best four-in-hand team, Mares or Geldings—1, G. D. Wright, Charlottetown.

Single Pony, 12 hands and under in harness—1, Alex. McKay; 2, Horne Bros.; 3, Mrs. Henry Benoit.

CATTLE

Bull, 3 yrs. and upwards—1, J. M. Laird & Son, Kelvin Grove; 2, Alexander Agnew, Charlottetown; 3, S. C. Lane, Pownal.

Bull, 1 yr.—1, Albert Boswall, French Fort.

Bull Calf, under 1 yr. and over 6 mos.—1, J. M. Laird & Son; 2, S. L. Boswall.

Bull Calf under 6 mos. and over 3 mos.—1, J. M. Laird & Son; 2, J. Herman Jones, Pownal.

Cow in milk or calf, 3 yrs. and upwards—1, J. M. Laird & Son; 2 and 3, J. S. Irving, Cherry Valley.

Cow in milk or calf, 2 yrs. old—1, and 2, J. M. Laird & Son;; 3, J. S. Irving.

Heifer, 1 yr.—1. 2 and 3, J. M. Laird & Son.

Heifer Calf under 1 yr. and over 6 mos.—1 and 2, J. M. Laird & Son; 4, S. L. Boswall.

Heifer Calf, under 6 mos. and over 3 mos.—1 and 2, J. M. Laird & Son; 3, John Jewett, North River.

Champion Bull shown in class—Diploma, J. M. Laird & Son.

Champion Female—Diploma, J. M. Laird & Son.

Herd, 1 bull, and 4 females, over 2 yrs.—1, J. M. Laird & Son.

Breeders Young Herd, 1 bull, 4 females, under 2 yrs.—Diploma, J. M. Laird & Son.

Special prizes by Dominion Shorthorn Breeders Association

Bull. and 3 of his get—1, J. M. Laird & Son.

Cow and 2 of her offspring—1, J. M. Laird & Son; 2, J. S. Irving.

Breeder's Young Herd—1 and 2, J. M. Laird & Son.

Best four animals, either sex, any age, progeny of one cow—1, Jas. Irving.

Best 4 animals, get of one sire—1, J. M. Laird & Son.

(Continued on page 10)

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

November 5-19
December 3-17

MAKING GOOD ROADS FROM BAD

Most men will admit that they never knew how bad country roads really were until they started driving an automobile, nor how easily an average dirt road could be improved by a little work of the right kind at the right time. Bumping over a bad road in one's own car is the most effective means known for arousing interest in the road problem and for getting started everywhere the kind of road work that really improves the highway. As the number of automobile owners increases in the country, so will increase the miles of roadway that are maintained by systematic roadwork, by dragging, grading, filling in low places and draining, but especially by dragging. The road drag is the most effective implement there is for caring for an earth road. No other device is anywhre near as effective in maintaining a smooth surface easy to ride over and easy to haul loads over, providing it is used properly and at the right time. The right time to drag is after a rain, when the mud is dry enough to work well, when the drag leaves the surface smooth and level. A little experience teaches just when a particular soil is in best condition after a rain to put the drag over it, and if every two or three miles of main highway in the well settled sections were in charge of a farmer residing on it, preferably the owner of an automobile, as is the case in many districts where the personal interest in roads of the man with the car is being made use of in this way, several thousand miles of improved highway could be added to the good roads map in a single season. The road drag is as necessary as the road itself. One man and a four-horse team can drag twenty miles of road per day at a cost of thirty-five cents per mile, which we would say is a cost that can be met by any municipality, at least for its main roads. It is gratifying to note the progress that is being made in all sections of the country in the improvement of the roads and the interest that people everywhere are taking in the problem. For better roads and a better knowledge generally of the means fo rkeeping earth roads in condition we are indebted chiefly to the motor car. Farmer automoblists are the most enthusiastic supporters the good roads movement has.

ARE THESE YOUR METHODS?

From "somewhere in Missouri" an answer to a world-old query reaches the editorial desk; a rather clever one it is too. And there is about as much truth as real poetry in the lines which we reproduce here in the hope that they may cause some devoted "dad" to sit up and take notice. We quote:

"Why did you leave the farm, my lad?
Why did you bolt and leave your dad?
Why did you beat it off to town
And turn your poor old father down?
Thinkers of platform, pulpit and press
Are wallowing in deep distress.
They seek to know the hidden cause
Why farmer boys desert their pa's.

"Well, stranger, since you've been so frank,
I'll roll aside the hazy bank:
I left my dad, his farm, his plow,
Because my calf became his cow.
I left my dad, 'twas wrong of course,
Because my colt became his horse.
I left my dad to sow and reap
Because my lamb became his sheep.
I dropped the hoe and stuck the fork,
Because my pig became his pork.
The garden truck that I made grow
Was his to sell, but mine to hoe.

"It's not the smoke in the atmosphere,
Nor the taste for life that brought me here.
Please tell the platform, pulpit, press
No fear of toil nor love of dress
Is driving off the farmer lads.
It's just the methods of their dads."

"My pig became his pork!" Yes, we had one once. It was not the best one in the litter either when we were given the right to call that "runt" our own. We found out afterwards that this merely meant the right to stuff and coddle that blessed pig to the limit of our desires; for it grew into a wide-backed, thrifty, "bully" sort of pig; quite good enough to go into the regular course of trade in breeding stock, and our fancied ownership was never altogether recognized. Perhaps that was a boy's own exaggerated idea of what belonged to himself by right of conquest, as it were; but he always considered that father really got the bacon! That is not exactly the explanation as to why this particular boy left the farm. There were more weighty reasons. But there is, nevertheless, some food for thought in the rhymestic lines.

AN APPEAL TO INTELLIGENT SELFISHNESS

Farmers are continually being urged not to be selfish in their aims—to look at the national rather than a sectional interest. A good deal of this sort of chatter comes from people who are themselves as completely and narrowly selfish as they are wholly divorced from real work. One of these pleaders for unselfishness, on the part of the other fellow, is the mayor of a western Ontario city and a man who, to the best of my belief, has not done any real work in the last ten years. On the same day that I heard this official pleading for unselfishness on the part of farmers, I heard a group of three or four men, all of whom had a waist measurement surpassing by several inches that about the chest, most vigorously denouncing the scale of prices being charged for food produced on the farm. It was all right, from their point of view, that everything the farmer has to buy should double and treble in price, but all wrong that the price of things the farmer had to sell in order to make a living should advance at all.

Occasionally, however, this appeal for unselfishness on the part of the farmer does come from good and sincere people. As a general principle, too, the appeal made by such is in every way commendable. The ideal of none for the party but all for the state is a most excellent one. But we are faced by a condition, not a theory. All classes in the community except agriculture are organized. Individual members of these other classes may be all right, but collectively they are pursuing wholly selfish aims. They may be doing this unconsciously, but doing it they assuredly are. Under such circumstances, if farmers do not show an intelligent selfishness, for the time being at least, they are going to be forced into an inferior position, a very much inferior position. And that would be disastrous not only to agriculture but to every other legitimate interest as well.

It would be disastrous for the nation as a whole for this reason: Farmers form the one great class with ample opportunity for real thinking. Not that they have more leisure than people of other classes; they have less leisure. But a man can think while following a plow, driving a binder, or even while forking sheaves onto a load. A man cannot really think amid the clatter of machinery in a factory or in the bustle of an office with a telephone at one side, a stenographer at the other, and callers constantly demanding attention in front. Moreover the farmer is independent; he does not depend on others for employment; he is not, at present at least, dependent on great financial interests for the means of carrying on his business. There is no other class of which this can be said. And the proper working of democratic institutions depends on the existence of a really independent body of voters. Not only is a well established agriculture essential to the preservation of real democracy, but it is essential to the permanent real prosperity of every other class. For these reasons I make no apology for a direct appeal to intelligent selfishness, to a looking to the preservation of their own special and vital interests, on the part of farmers.

THE BEST PAYING PROPOSITION ON THE FARM

It has been proved beyond doubt that the drains constitute one of the best investments possible to the farmer with surplus cash and a wet farm. For the man without the surplus there is no purpose for which he can borrow money with greater assurance that it will be refunded principal and interest in a very short time than by draining his farm. The Government could not render more effective aid to the farmers than by loaning them money with which to drain their lands at a low rate of interest.

The cost of tile drainage runs from $25 to $40 per acre. This amount to say $3,000 per 100 acres, a considerable sum for most of our farmers to raise, but they may be sure that the farm will repay it.

Professor Day, of Guelph, conducted an investigation some years ago in Ontario as to results of underdrainage in that province.

The following facts were established: (1) The average cost of drainage was $25 per acre; (2) that underdrainage paid for itself in from 2 to 4

* * *

years; (3) that the average increase in yield per acre was worth $20; and (4) that underdrainage proved beneficial in dry as well as in wet seasons. This last point has been expressed thus by one observer: "Underdrainage makes wet lands dry and dry lands moist." This sounds paradoxical, but it is true.

CLOVERS AND CLOVER SEED PRODUCTION

Red clover is one of the principal foundation stones of permanent agriculture. It has for centuries constituted an important factor in maintaining a permanent system of agriculture in the Old World. In this country, it has assumed in recent years a more and more important role in the maintenance of soil fertility. It is utilized both as hay and as a pasture crop, and sometimes as a soiling crop.

Clover as Feed—Clover cut at the right time and properly cured can hardly be surpassed as a dry fodder for dairy cows and beef cattle. A moderate amount mixed with timothy is also good for horses. Sheep and young stock are fond of clover and will thrive better upon it than upon timothy. It contains more digestible protein and is also a better fat producing fodder than timothy.

Clover as a Fertilizer—Clover stores in the tubercles on its roots nitrogen from the air and it also forms humus in the soil when ploughed under as a green manure. Consequently, it adds plant food to the soil and improves its texture. From 1894 to 1902 comprehensive experiments were conducted at the Central Experimental Farm, Ottawa, to determine the effect of clover upon soils. Various kinds of farm crops were grown on plots, a portion of which had grown clover in the previous and a portion of which had not been seeded to clover the previous year. A large number of plots were used in this experiment, many kinds of crops were grown and as the experiment extended over several years, the results are reliable and valuable. There was a noticeable increase in yield on the plots where clover had been grown. The increase in Banner oats amounted in some instances to as much as 19 bushels an acre. The increase in barley was as high as 15 bushels an acre. In corn fodder, the increase on the plots receiving clover was as high as four tons in the case of Longfellow, while with Leaming, there was an increase, in some instances, of over 11 tons per acre. Potatoes showed an increase as high as 50 bushels to the acre on the clover plots.

The method of conducting these experiments was, briefly, as follows: Ten or twelve pounds of clover seed were swon in the spring with a nurse crop. Late in the fall the resulting clover crop was ploughed down if grain was to follow the next year, or ploughed down the second or third week in May of the following spring if corn and potatoes were to be planted. Thus, it was from only one year's growth of the clover, that these results were obtained. Other experiments have been conducted which have shown that a crop of clover stubble ploughed under increased crop yields.

Good Seed Necessary.—In sowing clover, good seed should be used. Good seed, though costing more, has been found by repeated trial to be the cheapest in the end.

Methods of Seeding.—While clover has been hailed as a great soil improver, it must not be thought that it can always be grown successfully on poor and worn-out soils, or that it will give satisfactory results when carelessly sown. In some counties, clover is usually seeded with the spring grain. On sandy soils it should be sown a little deeper than on the heavier soils in order that it may come in contact with the moist earth, which will aid germination. From one and one half to two inches is not too deep in sandy soil. A better seeding will usually be obtained when sown with a nurse crop that will be harvested early than if sown with later maturing crops. When clover seed is being sown, it is best to sow the nurse crop slightly thinner than usual. A light top dressing of manure on the knolls and on spots where the soil is poor will often prove beneficial and will help the young plants to make a stronger growth to carry them through the winter.

There are various opinions regarding the effect of clover seeding on the nurse grain crop. This matter has received attention from the Central Experimental Far mat Ottawa and it has been found that the seeding of clover has no noticeable effect upon the yield of the grain crop with which it is sown. Further south, it has been found that, when the nurse crop is cut, the hot dry weather often kills out the young crop of clover. This may occasionally happen in Eastern Ontario, but the weather is usually cool enough and there is generally sufficient moisture in the soil to enable the young plants to survive and become vigorous before going into the winter.

Clover Sown with Summer Pasture.—Land where annual summer pastures are sown, such as oats and peas, or oats and vetches is usually a good place to seed with clover. It has been found that, on account of the nurse crop being pastured off early, the clover seeding is given an opportunity to develop. While the tramping of the ground may be thought to injure the clover plants, it has been found to be beneficial rather than harmful.

Seeding with Fall Grain.—While very little fall grain is grown in Dundas county, the method of seeding fall crops may be here maintained. Timothy is sown in the fall with the fall grain and the clover seeded in the spring. The clover seed should be sown upon the last light fall of snow late in the spring or on a morning when the ground is slightly frozen.

Thickness of Seeding.—Many farmers fail to get a good stand of clover because the ydo not sow enough seed. Where a field is to be kept for hay and pasture, timothy should always be sown with the clover. If the clover does not come through the winter successfully, or, for some other reason, does not give a good crop, the farmer will have the timothy to fall back upon. A good mixture, is eight pounds of red clover, two pounds of alsike, and eight pounds of timothy. This may seem a fairly heavy seeding, but from many tests conducted at our experimental stations, the thick seeding of clover and timothy has given uniformly better results than the thin seeding. On the heavier soil of Dundas county, if the season is favourable, a lighter seeding of clover will give good crops, but it is safer to sow a sufficient amount to allow for the seeds that will not germinate and for the plants that will be killed out. The thicker stand of clover also forms a winter protection and helps the plants to survive the cold weather. A thick crop of clover also helps to control and smother out weeds. In a thin crop of clover there will always be open spaces where weeds ar sure to grow. An excellent test for each farmer in Dundas county to conduct would be to sow, on a field where soil conditions are uniform, a round or two of the drill with a lighter seeding than he usually sows, and a round or two of the drill with a heavier seeding than he usually sows. The two plots should be sown side by side and each seeding carefully marked in order to compare the results, both as to ability to come through the winter and as to yield.

Care of Clover Going into the Winter.—Many farmers make a practice of pasturing the young seeding in the fall after the grain crop has been cut. They think it is a waste to allow the young crop to go unpastured. Experience has shown that very often young clover crops closely pastured down have been killed out during the winter, because the vitality and strength of the plants were gone and in their weakened condition they could not survive the trying winter and spring weather.

If clover is being tried on a field where the soil is poor, it is a good plan to give it a light top dressing of manure after the grain crop has been cut. This will strengthen the young plants and will help them to come through the winter in better condition.

Seed Production.—A very small percentage of the farmers in Dundas county are producing their own clover seed. This is not because it cannot be successfully produced in Dundas, but because very little attention has been given to this matter in the past. Some splendid crops of seed were harvested and threshed by Dundas County farmers during the past season. There are many advantages to be gained by growing and sowing home-grown seed. The farmer who has seed of his own this year (1918) will not likely sow it so sparingly a she would if he had to buy it at the present high price. Best results are obtained from the home-grown seed. On a number of illustration farms conducted in other parts of Ontario by the commission of Conservation in previous years, home-grown seed, and seed purchased from seed merchants, were sown side by side in the same field, under uniform conditions. In every instance, the home-grown seed came through the winter better. In some cases, the crop from home-grown seed came through the winter safely, while that from purchased seed was badly injured. By sowing home-grown seed, there is no risk of introducing noxious weeds from other parts of the country as often happens when the seed is purchased.

The second crop of clover is often pasture dwhen it would pay much better to allow it to ripen for seed. It does not matter if some timothy or other grasses be present, as the clover aftermath is but little affected by other grasses in the second crop, which usually make a light second growth. It often happens too, that a second crop of clover looks thin and may be thought too poor to produce a crop of seed. Let it be remembered, however, that a thin crop will not produce much pasture. In one case in Quebec, known to the writer, a 24-acre field of second crop, which was being kept for seed, looked to be too thin to be worth harvesting and though it gave only one-half ton to the acre of the clover before being threshed, it yielded 141 pounds of seed per acre. Had this field been pastured much of the clover would have been tramped down into the ground and the amount of feed really obtained by the stock would have been small.

Cut First Crop Early.—A mistake commonly made by many farmers is the cutting of the hay crop too late. Very often this will prevent the harvesting of a crop of clover seed. The seed on red clover comes from the second cutting; consequently, the first crop should be cut early to allow the second crop to produce seed before danger of frost in the fall. To get best results, the first crop should be cut very early. Many farmers postpone the cutting of the first crop, thinking that the longer they leave it the tomtons of hay they will obtain. This is true up to a cetrain point, but, after thore point is reached in the maturity of the crop, the percentage of crude fibre becomes greater, lowering the percentage of digestible protein. Early ctu hay, providing it is well cured, will be more nutritious and more readily eaten than hay which is allowed to become too ripe. Cut the first crop early if the second crop is to be saved for seed.

Keep Weeds Cut.—Home-grown seed is good, but absolutely clean home-grown seed is better. There will likely be more weeds in th first crop than in the second. The weeds in the second crop should be kept cut or pulled. This is usually an easy matter to handle. The weeds at this time of year are not so troublesome and, as the second crop does not usually grow so high, the weeds can be seen and removed. It will pay to do it. The cleaner the seed, the higher it will grade; and the higher it will grade, the higher price that can be obtained for that which is to be sold.

Time to Cut for Seed.—As a rule, the second crop may be cut for seed when nearly all of the heads are well browned. Do not be governed altogether, though, byt the number of browned heads. It is well to go carefully over the field and pluck a few heads here and there and rub them out in the palm of the hand. If the heads shell easily and the seeds come out clean, it is time to cut. If the seed is soft and not properly filled, or if it cannot be shelled out easily, let the crop stand, even if a few of the riper heads are lost. If the seed is ripe in the head, the early frosts of fall will not hurt it. If the seed is not ripe, it will not be good for sowing, even if cut to avoid frost. A common mistake made by inexperienced clover seed growers is to cut the seed crop too early.

How to Cut.—The old self-rake reaper was commonly used in Western Ontario for cutting clover seed and a few may be found on farms to-day, kept for this purpose. Some implement companies manufacturc a clover harvester which is especially designed to cut clover seed. Any farmer who has not one of the self-rake reapers, or a clover harvester need not be deterred from growing clover on this account as other devices can be used. The ordinary mower can be utilized for this purpose. It should be used in the morning while the dew is still on, to prevent the seed from shelling. A better arrangement is the ordinary mower with a table attached to the cutter bar. It requires two men to handle this outfit. A couple of holes are drilled at the back of the cutter bar and the table is attached by means of wire close up to the cutter bar and allowed to drag on the ground behind. A man follows with a fork or rake to keep the clover drawn back on to the table, and pushes it off to one side in windrows. The ordinary grain binder may also be used, the twine and the trip arm may be removed and the two small boards that hold the sheaf may be slackened or removed in order to allow the clover a free course to the ground. This will lay it out in a swath on the stubble in a splendid position to dry and out of the way of the horses and machine. If the clover is high enough to permit of cutting in this way, it is probably one of the best methods which can be used. The windrow can be easily gathered with a barley fork.

The length of time to allow the clover to remain in the windrow will depend on the weather and the condition of the crop when cut. It frequently happens that the crop will have to remain out two or three weeks before it is dry enough to thresh or draw into the barn.

Method of Threshing.—The clover huller is the best machine for threshing the seed. A better job can be done with this machine than with any other, but it is not absolutely necessary to have a huller. A fairly good job can be done with teh ordinary grain thresher providing certain adjustments are made. If the clover straw is to be used for feed, it might be well to run the material through, just the same as grain is put through. This will separate the heads and chaff from the straw. The heads and chaff can then be put through a second, or third time, but before putting them through, a plate of sheet iron or a hard board should be placed directly behind the cylinder, closing up all of the back space except about nine inches on the left-hand end of the cylinder. Another board should be placed in front of the cylinder to close up all except one foot at the right-hand end. All small holes in the concaves should be closed and the concaves set as close to the cylinder teeth as possible. This will cause all of the material to pass from one end of the cylinder to the other, which will hull the seed much better than if passed through in the ordinary way. The chaff can be put through two or three times carefully, and it will be found that nearly all of the seed will come out clean. This is not as good as the clover huller, but is very useful when a huller cannot be obtained.

THE PRINCE EDWARD ISLAND EXHIBITION

(Continued from page 7)

Two animals, either sex, progeny of one cow—1 and 2, J. M. Laird & Son.

Heresfords

Bull, 2 yrs.—1, G. L. Hayden, Cherry Valley.

Bull, 1 yr.—1, G. L. Hayden.

Cow in milk or calf, 3 yrs. and upwards—1, G. L. Hayden.

Cow in milk or calf, 2 yrs. old—1, G. L. Hayden.

Heifer, 1 yr. old—1, G. L. Hayden.

Heifer Calf, under 1 yr. and over 6 mos.—1, G. L. Hayden.

Heifer Calf under 6 mos. and over 3 mos.—1, G. L. Hayden.

Herd, 1 bull and 4 females, over 2 yrs.—1, G. L. Hayden.

Aberdeen or Polled Angus

With Certificate of Registration

Bull, 3 yrs. and upwards—1, Horne Bros., Winsloe Sta.

Bull, 2 yrs.—1, Horne Bros.

Bull, 1 yr.—1, Horne Bros.

Bull Calf, over 1 yr. and under 6 mos.—1, Horne Bros.

Cow in milk or calf, 3 yrs. and upwards—1 and 2, Horne Bros.

Cow in milk or calf, 2 yrs. old—1 and 2, Horne Bros.

Heifer, 1 yr. old—1 and 2, Horne Bros.

Heifer Calf under 1 yr. and over 6 months—1 and 2, Horne Bros.

Heifer Calf, under 6 mos. and over 3 mos.—1, Horne Bros.

Herd, 1 bull and 4 females over 6 yrs.—1, Horne Bros.

Breeders Young Herd, 1 bull and 4 females under 2 yrs. old—Diploma, Horne Bros.

Champion Bull, shown in class—Diploma, Horne Bros.

Champion Female, shown in class—Horne Bros.

Ayrshires

Bull, 3 yrs. and upwards—1, Easton Bros., Charlottetown; 2, A. E. Ings, Charlottetown; 3, Pope Noy, Hazelbrook.

Bull, 2 yrs. old—1, Easton Bros.

Bull, 1 yr.—1, Vernon McMillan, Charlottetown; 2, Easton Bros.; 3, Edwin Reid, Rollo Bay.

Bull Calf, under 1 yr. and over 6 mos.—1, Edwin Reid; 2, Easton Bros.

Bull Calf, under 6 mos. and over 3 mos.—1 and 2, Easton Bros.

Cow in milk or calf, 3 yrs. old—1, A. McRae & Sons; 2, W. R. Yonker, Charlottetown; 3, Edwin Reid.

Cow in milk or calf, 2 yrs. old—1, John Barr, Charlottetown; 2, Ernest Munn, Hazelbrook; 3, Easton Bros.

Heifer, 1 yr.—1 and 3, Easton Bros.; 2, A. McRae & Sons.

Herd, over 2 yrs.—Easton Bros.

Breeders Young Herd—Diploma, Easton Bros.

Champion Bull shown in class—Diploma, Easton Bros.

Champion Female shown in class—Diploma, A. McRae & Sons.

Special prizes by the Canadian Ayrshire Breeders' Association.

Best 4 animals, either sex, any age, get of 1 sire, bred by exhibitor—1 and 2, Easton Bros.

Best 2 animals, either sex, any age, produce of one cow, owned by exhibitor—1, Easton Bros.; 2, John Barr; 3, A. McRae & Sons.

Cow in milk or calf, 4 yrs. and upwards—1, A. McRae & Son; 2, Edwin Reid; 3, Easton Bros.

Jerseys

Bull, 3 yrs. old and upwards—1, Wallace Stead, Highfield; 2, Alex. McKay, Charlottetown.

Bull, 1 yr.—1, Wallace Stead.

Bull Calf, under 1 yr. and over 6 mos.—1, Stephen Holroyd, Winsloe; 2, Alex. McKay.

Bull Calf, under 6 mos. and over 3 mos.—1, 2 and 3, Wallace Stead.

Cow in milk or calf, 2 yrs. old—1, Wallace Stead.

Heifer, 1 yr.—1, Wallace Stead.

Heifer calf, senior—1, Wallace Stead

Heifer Calf, Jr.—1 and 2, Wallace Stead.

Herd, 1 bull, 4 females over 2 yrs.—Diploma, Wallace Stead.

Breeders Young Herd, under 2 yrs.—Diploma, Wallace Stead.

Champion Bull, any age—Diploma, Wallace Stead.

Champion Female—Diploma, Wallace Stead.

Guernseys

All prizes to Roper Bros., without competition.

Holstein-Friesian

Bull, 3 yrs. old—1, W. J. Gibson & Son, Marshfield.

Bull, 2 yrs. old—1, W. M. Lea, Victoria.

Bull, 1 yr. old—1, W. M. Lea.

Bull, Senior Calf—1, W. J. Gibson & Son; 2, W. M. Lea.

Bull, Junior Calf—1, W. M. Lea; 2, W. J. Gibson & Son.

Cow, 3 yrs. old—1, 2 and 3, W. M. Lea.

Cow, 2 yrs. old—1, W. M. Lea; 2, W. J. Gibson & Son

Heifer, 1 yr. old—1 and 3, W. J. Gibson & Son; 2, W. M. Lea.

Heifer, Senior Calf—1, W. J. Gibson & Son; 2, W. M. Lea.

Heifer, Junior Calf—1 and 2, W. M. Lea.

Herd—1, W. M. Lea; 2, W. J. Gibson & Son.

Breeders Young Herd—Diploma, W. J. Gibson & Son.

Holstein-Friesian Association Special Prizes

Best 4 calves, bred by exhibitor—1, W. M. Lea; 2, W. J. Gibson & Son.

Best 4 animals, any age, get of one sire—1, W. M. Lea; 2, W. J. Gibson & Son.

Best 2 animals, any age, get of one cow—1, W. M. Lea; 2, W. J. Gibson & Son.

Breeders' Young Herd—1, W. J. Gibson & Son.

Canadian Bank of Commerce Special Prize Champion Holstein-Friesian heifer, one year old—Silver Medal, W. J. Gibson & Son.

Beef Grades

Cow, 4 years old—1, Horne Bros.; 2, S. L. Boswall; 3, J. S. Irving; 4, Jos. Praught.

Cow, 3 years old—1, Horne Bros.; 2, J. S. Irving; 3, G. L. Hayden.

Cow, 2 yrs. old—1, Jos. Praught.

Heifer, 1 yr. old—1, Wallace Stead; 2, Jos. Praught; 3, Albert Boswall.

Heifer, Senior Calf—1, Jos. Praught; 2, G. L. Hayden.

Heifer, Junior Calf—1, J. S. Irving.

Ayrshire Grades

Cow, 4 years old—1, J. H. Love; 2, Wm. Gregory; 3, Calvin Wood.

Cow, 3 yrs. old—1, S. Holroyd; 2, Edwin Reid; 3, J. H. Love.

Heifer, 2 yrs. old—1, J. H. Love.

Heifer, 1 yr. old—1, A. McRae & Sons; 2, Easton Bros.

Jersey and Guernsey Grades

Cow, 4 yrs. old—1, Jas. F. Roper; 2, Stephen Holroyd; 3, A. McRae & Sons.

Cow, 3 yrs. old—1, Jas. F. Roper.

Cow, 2 yrs. old—1, Jas. F. Roper.

Heifer, 1 yr. old—1, S. Holroyd; 2, Jas. F. Roper; 3, J. L. Connolly.

Heifer, Senior Calf—1, S Holroyd; 2, Jas. F. Roper.

Heifer, Junior Calf—1, Jas. F. Roper.

Holstein Grades

Cow, 4 yrs. old—1, W. M. Lea; 2, J. L. Connolly.

Cow, 3 yrs. old—1, W. J. Gibson & Son.

Heiefr, 2 yrs. old—1, W. M. Lea; 2, Calvin Woods; 3, Ernest Ings.

Heifer, 1 yr. old—1, Calvin Wood; 2, J. H. Love.

Heifer, Senior Calf—1, Wm. Gregory; 2, W. M. Lea.

Heifer, Junior Calf—1, Calvin Wood; 2, W. J. Gibson & Son.

W. M. Lea, Special Prize for Best Heifer Calf under 1 year, sired by a Pure Bred Holstein Bull—1, Calvin Wood; 2, Wm. Gregory; 3, W. M. Lea.

Advance in Ford Prices

Owing to the high csot of raw materials the Ford Motor Co. of Canada have been forced to advance al lprices on cars. The changes are as follows:—

TOURING	$ 690
RUNABOUT	$ 660
CHASSSIS	$ 625
COUPE	$ 875
SEDAN	$1075
TRUCK	$ 750

F.O.B. FORD, ONTARIO

In our August 27th issue the old prices were quoted. The advance is these prices is a small matter considering War conditions and the evergrowing popularity of the Ford will hardly be affected by the change.

P. E. Island Dept. Agriculture Special Prize to the person showing the greatest skill in judging Dairy Cattle—1, Earle McRae; 2, Percy McRae; 3, E. Ings; 4, W. Gibson; 5, P. Praught.

Steers

Best pair fat Cattle, 2 yrs. old—1, G. L. Hayden.

Best single fat animal, 2 yrs old—1, G. L. Hayden.

Best pair fat animals, 1 yr. old—1, Jos Praught.

Best single fat animal, 1 yr. old—1, Jos. Praught.

Canadian Bankers Competition for Boys and Girls under 17 yrs. Dairy Calf, Pure Bred or Grade, fed by same—1, Myrtle Stead; 2, Ella Ings; 3, Russel Roper; 4, Clifford Munn; 5, Geo. McLaren.

Prizes iven by Prof. G. E. Day to Boy or Girl for best fed beef calf—1, Cyril Jones; 2, W. Praught.

SHEEP

Leicesters

Ram, 2 shears and over—1, S. L. Boswall, Pownel; 2, Almon Boswall, Pownal; 3, W. H. Moase, New Annan.

Ram, shearling—1, S. L. Boswall; 2, W. H. Moase; 3, S. C. Stewart & Son, Dunstaffnage

Ram, lamb—1, S. C. Stewart; 2, W. H. Moase; 3, S. L. Boswall.

Ewe, 2 shears and over—1, S. L. Boswall; 2, S. C. Stewart; 3, W. H. Moase.

Ewe, shearling—1, S. C. Stewart; 2, S. C. Lane; 3, S. L. Boswall.

Ewe, lamb—1, W. H. Moase; 2, S. C. Stewart; 3, S. C. Boswall.

Flock, 1 ram, 2 ewes, each to have raised a lamb this season, 1 shearling ewe, 1 ewe lamb—1, S. L. Boswall; 2, S. C. Stewart; 3, W. H. Moase.

Cotswolds

Ram, 2 shears and over—1, John Tweedy, Ernscliffe; 2, Almon Boswall.

Ram, shearling—1, Harry Tweedy, Ernscliffe; 2 and 3, John Tweedy.

Ram, lamb—1, Almon Boswall; 2, John Tweedy; 3, Harry Tweedy.

Ewe, 2 shears and over—1 and 3, John Tweedy; 2, Harry Tweedy.

Ewe, shearling—1 and 2, John Tweedy; 3, Harry Tweedy.

Ewe, lamb—1 and 3, Almon Boswall; 2, John Tweedy.

Flock—1, John Tweedy; 2, Harry Tweedy; 3, Almon Boswall.

Lincolns

Ram, 2 shears and over—1, Albert Boswall, French Fort; 2, Pope Noy, Hazelbrook.

Ram, shearling—1 and 3, Albert Boswall; 2, Ernest Lund, Hazelbrook.

Ram, lamb—1 and 3, Albert Boswall; 2, Pope Noy.

Ewe, 2 shears and over—1 and 2, Albert Boswall; 3, Ernest Lund.

Ewe, shearling—1, 2 and 3, Albert Boswall.

Ewe, lamb—1, Ernest Lund; 2, Albert Boswall; 3, Pope Noy.

Flock—1, Albert Boswall; 2, Ernest Lund; 3, Pope Noy.

Southdowns

Ram, 2 shears and over—1, W. M. Lea, Victoria; 2, E. Saunders, Winsloe; 3, Oliver Saunders, Wnisloe.

Ram, shearling—1 and 2, Oliver Saunders; 3, E. Saunders.

Ram, lamb—1 and 2, E. Saunders; 3, Oliver Saunders.

Ewe, 2 shears and over—1 and 3, E. Saunders; 2, Oliver Saunders.

Ewe, shearling—1 and 3, E. Saunders; 2, Oliver Saunders.

Ewe, lamb—1 and 2, E. Saunders; 3, Oliver Saunders.

Flock—1, E. Saunders; 2, Oliver Saunders.

Shropshires

Ram, 2 shears and over—1 and 2, Geo. L. Boswall; 3, Almon Boswall.

Ram, shearling—1, Geo. Boswall; 2, J. S. Irving, Cherry Valley.

Ram, lamb—1 and 2, Geo. Boswall; 3, Almon Boswall.

Ewe, 2 shears and over—1 and 2, Geo. L. Boswall; 3, Almon Boswall.

Ewe, shearling—1, J. Boswall Stewart, Dunstaffnage; 2 and 3, Geo. L. Boswall.

Ewe, lamb—1 and 2, Geo. L. Boswall; 3, Almon Boswall.

Flock—1, Geo. L. Boswall; 2, Almon Boswall.

Oxford Downs

Ram, 2 shears and over—1, J. M. Laird & Sons, Kelvin Grove; 2, A. E. Boswall, York.

Ram, shearling—1, Burden Goodwin, Baie Verte, N. B.; 2, J. M. Laird & Son; 3, David Laird & Son.

Ram, lamb—1 and 3, Burden Goodwin; 2, J. M. Laird & Son.

Ewe, 2 shears and over—1, J. M. Laird & Son; 2 and 3, Burden Goodwin.

Ewe, shearling—1, Burden Goodwin; 2 and 3, J. M. Laird & Son.

Ewe, lamb—1 and 2, Burden Goodwin; 3, J. M. Laird & Son.

Flock—1, Burden Goodwin; 2, J. M. Laird & Son; 3, A. H. Boswall.

Oxford Down Association Specials

Best yearling ram—1, J. M. Laird & Son.

Best yearling Ewe—1, Burden Goodwin; 2 and 3, J. M. Laird & Son.

Best Pen 4 lambs—1, Burden Goodwin; 2, J. M. Laird & Son.

Suffolks

Ram, 2 shears and over—1, A. Parker Horne, Winslow; 2 and 3, J. Reagh Horne, Winslow.

Ram, shearling—1, J. Reagh Horne; 2, A. Parker Horne.

Ram, lamb—1, J. Reagh Horne; 2, A. Parker Horne.

Ewe, 2 shears and over—1 and 3, A. Parker Horne; 2, J. Reagh Horne.

Ewe, shearling—1 and 3, A. Parker Horne; 2, J. Reagh Horne.

Ewe, lamb—1 and 3, A. Parker Horne.

Flock—1, A. Parker Horne; 2, J. Reagh Horne.

A Safe Investment

If your neighbor has a horse that is blemished and after two or three weeks of faithful treatment you see this same horse sound and in the best of spirits. doesn't it make you feel guilty to see your own horse "Down and Out" and you making no effort to relieve him?

This is the case with many horse owners. If they see a puff or bunch developing on their horse, instead of starting treatment immediately with a good, reliable liniment, they let it go, thinking that Nature will take care of it. The result in many cases is that the horse gets so bad that he is useless.

When using any kind of a liniment the first thing to be considered is, "Is it safe?" Absorbine is perfectly safe and harmless and is composed of the best ingredients that can be purchased. A pamphlet of interest to horse owners will be sent to anyone upon request. If your case requires special directions or there is some point not made perfectly clear in the pamphlet, the manufacturers are always glad to take the matter up and suggest line of treatment for each individual case.

Absorbine $2.50 a bottle at durggists or postpaid.

W. F. YOUNG, P.D.F.
124 Lymans Building.
Montreal, Canada.

Hampshire Downs

All Hampshire prizes were won by Cephas Nunn, Winsloe, without competition.

Dorsets

Ram, 2 shears and over—1, John Tweedy, Ernscliffe.

Ram, shearling—1, Geo. L. Boswall; 2, John Tweedy.

Ram, lamb—1 and 2, Geo. Boswall; 3, John Tweedy.

Ewe, 2 shears and over—1 and 2, Geo. Boswall; 3, John Tweedy.

Ewe, shearling—1 and 2, Geo. Boswall; 3, John Tweedy.

Ewe, lamb—1, Geo. L. Boswall; 2, John Tweedy.

Flock—1, Geo. L. Boswall; 2, John Tweedy.

Cheviots

Ram, 2 shears and over—1, Chas. D. McLean, Clyde River; 2, Robert Furness, Vernon Bridge.

Ram, shearling—1, Roebrt Furness.

Ram, lamb—1, Chas. D. McLean; 2 and 3, Robert Furness.

Ewe, 2 shears and over—1 and 3, Robert Furness; 2, Cephas Nunn.

Ewe, shearling—1 and 3, Robert Furness; 2, Chas. D. McLean.

Ewe, lamb—1 and 2, Robert Furness.

Flock—1, Robert Furness.

Canadian Bank of Commerce Special for best flock of sheep, any breed—Bronze Medal, Albert Boswall.

Long Wool Grades

Ewe, 2 shears and over—1, Albert Boswall; 2, S. C. Lane; 3, A. C. Boswall; 4 and 5, Edwin Reid.

Ewe, shearling—1, A. C. Boswall; 2, S. C. Lane; 3, Robert Furness.

Ewe, lamb—1 and 3, Pope Noy; 2, Ernest Lund.

Wether, shearling—1 and 2, S. C. Lane; 3, Robert Furness.

Wether, lamb—1, Robert Furness; 2, Alex. R. McKay; 3, S. C. Stewart.

Best fat ewe or wether—1, Robert Furness; 2, A. H. Boswall; 3, A. C. Boswall.

Short or Medium Wool Grades

Ewe, 2 shears and over—1, J. M. Laird & Son; 2, Oliver Saunders; 3, Cephas Nunn; 4, E. Saunders; 5, J. C. Irving.

Ewe, shearling—1, J. M. Laird & Son; 2, Geo. L. Boswall; 3, Cephas Nunn.

Ewe, lamb—1, Oliver Saunders; 2, J. M. Laird & Son; 3, Geo. L. Boswall.

Wether, shearling—1, Oliver Saunders.

Wether, lamb—1, Cephas Nunn; 2 and 3, Oliver Saunders.

Best fat ewe or wether—1 and 2, Oliver Saunders; 3, Cephas Nunn.

Fleece Wool

Domestic, medium—1, Earl W. Foster, Marshfield; 2, Cephas Nunn, Winsloe.

Domestic, Coarse—1, S. C. Lane, Mt. Mellick, Pownal; 2, Heath E. Foster, Marshfield.

SWINE

Berkshires

Boar, 2 yrs. old—1, H. R. Moase, Kensington.

Boar, 1 yr. old—1, Ernest Ings, Hazelbrook.

Boar, over 6 months and under 1 yr. —1, H. R. Moase; 2, S. C. Lane, Mt. Mellick.

Boar, under 6 months—1, A. E. Ings; 2, Peter Brodie, York.

Sow, 2 yrs. old—1, Ernest Ings; 2, Peter Brodie.

Sow, 1 yr. old—1, Peter Brodie.

DAIRYING.

FEEDING OF MILCH COWS

The feeding of the milch cow should start when she is dry in order properly to prepare her for the milking period. The thin cow at calving is in poor condition to make milk profitably, nor can she produce the most rugged and healthy calf. Allow the cow four to ten weeks dry period before freshening. A first-class pasture, with or without grain, according to the needs of the cow, is the best conditioner for the dry cow in preparation for the milking period. A pound of grain during the dry period is worth at least three pounds of grain fed after the cow has freshened. On poor pastures feed the dry cow green feed or silage and a grain ration composed of equal parts of any of the two following meals, bran, ground oats ,ground barley, ground screenings. To the thin dry cow feed four to seven pounds daily, even though on good pasture. To the dry cow in good flesh and on good pasture no grain whatever is necessary.

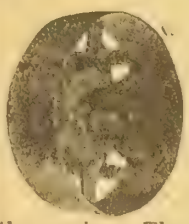
Feeding at Calving.—Special care is required in the feeding of the cow at freshening, the procedure varying with the individuality of the animal. Be sure that the condition of the bowels is normal. Constipation at this time is apt to induce such troubles as milk fever, while the opposite condition is tepid drink containing a handful of linseed meal. Allow to rest quietly for twelve hours, after which give a warm bran mash with two bran mashes on the second day. Feed indoors for three days, giving a limited supply of green feed or good hay. Draw a little milk three to four times daily for the first three days. Do not milk dry until after the third day, as such procedure freuently induees milk fever. On the fourth day the cow may start on pasture but it is usually advisable to supply a meal ration consisting of equal parts bran and oats in addition thereto. Unless pastures are good, this grain ration should be continued and even strengthened with some more concentrated meal.

Feeding the Fresh Cow.—The cow weighing 1,000 pounds requires the equivalent of 40 pounds of mixed pasture grass, or 10 pounds each of clover, hay and oat straw for the maintenance of her body alone. To this must be added the food to supply energy and the ingredients to manufacture milk, hence meagre feeding of milch cows means light returns, and liberal feeding is always followed by heavy production and a lawer cost per gallon.

As a rule, milk produced during the summer months with an abundance of pasture is the cheapest production during the year, hence the proper care of pasture is most essential. Cattle should not be allowed to graze too early or so closely that the pasture is unable to withstand drought. With a shortage of permanent pasture, spring or fall sawn grains may be used as a supplement. Fall rye may be grazed both in the fall and spring. Such annual pastures as heavily seeded oats and barley or a mixture of oats, barley and wheat, will make excellent summer pasture. With present labor shortage it is probable that these annual pasture crops are more economical than the growing of soiling crops to be cut and hauled to the stock on pasture or in stables. However, such soiling crops as peas and oats seeded at different dates, second cut clover, corn or fall turnips fed with tops pulled, provide an excellent substitute for pasture. Silage made from corn or peos and oats, if available, is both a superior and a cheaper substitute for pasture.

Whatever the roughage may be, the majority of successful dairymen, as a rule, feed a limited grain ration during the summer months. A mixture of equal parts bran and oats or with the addition of 10 per cent. ground peas or some similar concentrated meal will give excellent results.—E. S. Archibald, Dominion Animal Husbandman.

BERNARD FRICTION PULLEY



With its use, engine can be started free with practically no effort from operator, and machines started smoothly without any of the usual jerkings of the engine.—Thus relieving belt friction and dangerous operation of putting on belt when engine is at full speed.

WATER AND SHADE INCREASE PROFITS OF DAIRY HERD

On dairy farms, where milk production is made a special business, there is seldom a want of attention to the matter of plenty of good water and shade for the cows during the hot and dry season. It is the ordinary farmer, who keeps cows only as a side line to general farming who is often negligent in this matter.

Cows giving milk during the hot weather, not only require an abundance of water, but they require it often. As the milk is composed largely of water, and its secretion goes on continually, there should always be plenty of water on hand, that the animal can get a supply. The low yield of milk in the dry season is usually attributed to the dired-up and partly scorched pasture, but we are certain that this is not so much the cause as the scant supply of water. In most cases a gain of 10 to 15 per cent. would easily be obtained, if the cows had free access toplenty of water.

It is surely very poor practice to water the milk cows only at milking time, mornings and evenings. It is also a cruel pratice, and it seems to us that such cases should have the attention of the humane officer. We have known animals not having enough water to become "breachy" beiny driven to this in attempting to search for water.

The farm having a small stream fed by a never-failing spring is nearly ideal for keeping milch cows. Many farms have small streams, but they become dry during droughts. In such cases there should by all means be a large tank in the barn yard to which the cows can have access at all times. The farmer is not upt-o-date who does not have either a windmill or gasoline engine to pump water for his stock. Those who would give the proper attention to the cows will see to it that the gate to the barnyard is always open at al times for them to enter. It is really surprising to notice how often the cows will come from the pasture during the day to drink, when they know they can get water.

tI sould be kept in mind that the quality of the water is just as important as quantity. We know of farms where the only supply furnished is fro ma small pond filled by the surface drainage after rains. The water stands until it is filled with myriads of insects, and becomes covered with a green scum. The cows wade about the pond ,or stand in it to fight the flies, stirring up the dirt from the bottom, rendering the water totally unfit for them to drink. Yet they will drink it because they can get no other.

Besides plenty of water for the cows, shade trees are an excellent thing in a pasture field. If there are no shade trees it is advisable to keep the cows in the stable from 10 o'clock until 3, giving them water before putting them in and also when turning them out. They will then feed with a good appetite. An open shed in the barn yard is better than the stable, and even at the present high price of lumber it would pay every farmer to build one.

Beyond the Experimental Stage

ALL along the line, at every point, the engineering problems peculiar to Kerosene as a fuel have been solved in the Renfrew. It is the true kerosene engine, not adapted from gasoline Engines but developed on **kerosene ideas.** The

Renfrew Kerosene Engine

is just bristling with advantages that coax the very last bit of power out of coal oil, reducing carbon troubles to a minimum. Run your eye down the accompanying list of features.

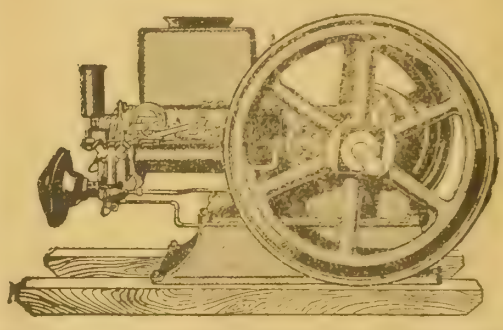
These things mean an engine you can depend on to give you real service at low cost —for kerosene is cheaper than gasoline, can be bought anywhere, and in this engine gives up all it's power.

That's the Engine for ***you.*** Learn all about it now by getting our free catalogue. Write today.

The Renfrew Machinery Co., Limited

Head Office and Works, Renfrew, Ont.
Eastern Branch, Sussex, N.B.

Other lines: Renfrew Cream Separator, Happy Farmer Tractor, Renfrew Truck Scales.



Features that mean Satisfaction

STARTING:—
Handy Controls—three at one place, needle valves, for regulating supply of gasoline, water and kerosene, easily adjusted.

RUNNING:—
Special Kerosene Mixer—with auxiliary air valve, insuring properly mixed charge under full or light load.
Throttle Valve, for fuel supply, controlled perfectly by sensitive governor.
Oscillating Magneto and igniter combined makes and fires the spark, always reliable.
Cooling—Ample water jacket and extra wide roomy hopper on top for water.
Perfect Alignment assured by heavy studs securing cylinder and frame (separate parts) easily renewable.
Gears—Machine cut, perfectly true and smooth.
Smooth, even running assured by extra heavy large diameter fly wheels.

CAUSES OF STREAKS IN BUTTER

A reader asks as to the cause of streaks appearing in butter. For his information, as well as for others who may experience the same trouble, we publish here an article on the subject by a well-known dairy authority:

It may safely be stated that streaked butter is first of all due to imperfect distribution of the salt. Salt has the effect of deepening the color of butter and when it is applied unevenly the result is streaks of lighter and darker shades atlernating with more or less regularity unless they are removed by working. Of course, it is practically impossible by the ordinary methods of salting butter on the farm to apply the salt evenly and the distribution must be left to the butter worker. If the working is thoroughly done the streaks will not appear in the finished product. But since overworking is one of the things which the amateur buttermaker is cautioned about, it sometimes happens that the color is not even.

In case one should doubt that the streaks in butter is due to the salting, a very simple test will be convincing. Let a pound of butter be taken from the churn, washed as usual and set aside for a few hours with an ounce of salt applied carelessly and not worked in, or make a ash in the surface of the butter with the ladle and throw in some salt. Where the salt is thick the color will be several shades deeper than where there is no salt. Brine salting practically does away with this trouble, because the salt is applied in solution. This method, however, is not entirely satisfactory, since it is somewhat difficult to obtain the desired degree of saltiness.

If the following suggestions for churning, salting and working are carefully followed there will be no troubel wtih streaks in butter. Churn

well-ripened cream at a temperature which will bring it to the draining point in granules the size of grains of wheat or rice. When that condition is reached, draw off the buttermilk and rinse the butter in plenty of water that is at about the same temperature as the buttermilk when drawn. Agitate gently so as to mass the granules and drain. Apply water at about the same temperature a seccnd time, again agitate, preferably by revolving the churn a few times and drain thoroughly. Have the salt sifted and weighed or measured. The latter is more convenient and quite accurate for all practical purposes since an ordinary half-pint measuring cup holds approximately one-half pound. One ounce of salt to the pound of butter is about right. Sift half the salt evenly over the surface of the butter, revolve the churn so as to expose teh bottom of the butter and sift the remainder of the salt over the granules thus brought to view. Only a fine grade of dairy salt should be used.

Now put the cover on the churn and revolve the churn slowly for a dozen times. Then remove the cover, drain off the brine and if the butter is gathered in large lumps break them up with a ladle or wooden paddle. Again close and revolve the churn as before, allowing the butter to drop solidly from end to end as it revolves. After a few minutes of this the butter is ready for the final pressing to eliminate the excess brine. This may be done with a butter-worker or in an ordinary wooden bowl with an ordinary ladle. In either case very little more work will be required and no subsequent handling necessary whatever.

To summarize, remember that streaks in butter are caused by uneven distribution o the salt. Working the butter first instance. Overworking spoils the grain, while insufficient working leaves too much brine and possible streaks. A thin wafer of perfectly worked butter should not break when folded almost over upon itself and should have a distinctly granular appearance when a bit of it is broken apart. Artificial coloring has nothing to do with streaks in butter, as some people suppose.

PRESERVING BUTTER FOR WINTER

It was the practice of our grandmothers to preserve the butter made in summer for winter use, packing it into jars and setting the jars in as cool a place as they had,—the cellar or the old fashioned milk house. Packed butter could be sold in the stores fifty years ago as readily as any other kind. Some people seemed to have a hankering for old butter in those days just as some have a hankering for old cheese in these. Butter put into crocks in June and left in the milk house till December or February had a "punch" that fresh butter altogether lacked. It had a taste and smell not distasteful to the butter consumer of those times who naturally expected to find butter a little frowsy towards the end of the winter.

It would not be possible to sell butter of this kind in the market now. It is possible, however, to preserve butter in fairly good condition, and those who are willing to use butter that is not first class may find it of advantage to use this plan. Butter that is to be kept for several months should be made from cream that has not been kept more than tw oor three days before churning. The quicker it is churned the better. The churning should be stopped when the butter is in small granules so that as much butter-milk as possible can be worked out. It should then be worked and salted and packed in a glazed crock or jar. A layer of about one inch of brine as strong as can be made should be kept over the butter. The jar should be kept cool in the basement or other place that is fairly cool. Special attention should be given to keeping the butter entirely away from light and air, because light and air cause butter to spoil rapidly.

KILLING LICE ON STOCK

External parasites are extremely troublesome on livestock. They do most injury when the animals are low in condition, for strong stock can resist them better than the weak ones.

The best way to get rid of body lice is to kill them. This can easily be done by applying contact dips or washes to the portions covered by the insects. The drip from pumping engines may be rubbed over the animals when placed in a small enclosure. A scrub brush or old broom with the end cut off to make a stiff stub makes a good method of applying the oil. If applied on top of the body and the stock turned out in the sun the oil will spread much better and have greater penetrating power. Any kind of oil which comes in contact with the verim will kill them.

One of the best mixtures for killing body lice is the kerosene emulsion. This is made by cutting one pound of hard soap into fine flakes and then dissolving it in a gallon of hot water. This mixture should be added to one gallon of crude petroleum and stirred well. tI may further be diluted by three times its quantity of water or six gallons. Such a quantity will make a good stock solution and can be applied by spray, brush, cloth, or a dipping vat. Keep the dip up well on the higher parts and turn the stock out in the sun so that a thin film of the solution will cover the entire animal. It is always necessary to repeat the dose from six to ten days depending on the season. During hot weather a short time between spraying is bst. Some people claim that lice may be killed by simply feeding the animals well. This is no cure and it is a ver yexpensive method at the present high prices of feed.—R. H. Williams, Animal Husbandman.

ROPY MILK CAUSED BY GERM

Of late not a few letters have been received by the Veterinary Editor regarding the cause and treatment of ropy milk.

Organisms live in stagnant water and infest pastures. On account of the heavy rainfall, this condition is more prevalent this year than usual. The ropy condition in the milk appears in about 18 or 24 hours.

Ropy milk is caused by an organism that is often found in stagnant water, according to the dairy experts at the Iowa State college. Cows in pastures with low ground that has overflowed or flooded lately will wade in such water, and the organisms will adhere to the skin and hairs, and fall into the pail at milking time.

If it is possible these pools and low places should be fenced off. It is also suggested that the water around the drinking tank be dried up and the barns cleaned and whitewashed. Before milking, the cow's side and udder should be cleaned by using clean water and soap, if needed—a little boric acid or common salt, dissolved in the water, will help.

Ropy milk may be caused in some instances by utensils that have not been properly cleaned and sunned or sterilized. Care should be taken to scald all milk pans and pails after they have been used. It is well to pasteurize the milk soon after it is drawn, if there has been trouble with ropy milk. This is done by heating to a temperature og 145 degrees F for 25 minutes. The milk may then be used with perfect safety.—Dr. A. M. Morgan.

SOUR VS. SWEET CREAM TEST

Does cream test more when it is sour than when it is sweet? This question has been asked so many times, especially during the past two years, and it no doubt has caused much trouble. Many have been led to believe that by holding their cream until it was real sour they would be given a higher test. This would be possible under one condition and that is, if a can of cream was allowed to stand for a long time at a rather high temperature, theer would be enough moisture evaporate to increase the per cent of fat slightly, but this would be very slight and in that length of time the cream would no longer be fit for a food. Still this would bring no higher price for the product as the extra per cent of fat would only make up for the amount of moisture which has evaporated.—E. O. Olsen, in Dairy Record.

UNIVERSALITY OF MILK

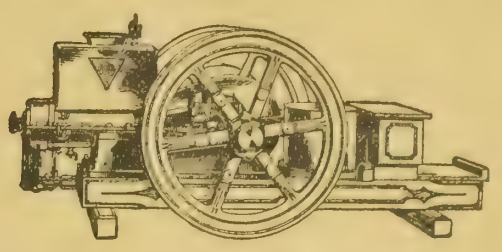
Whether as milk—raw, malted, powdered, or condensed; whether as cream—plain, whipped, or iced; whether as butter, alone, or in combination with other oils; whether as cheese in its many brands and varieties; whether as buttermilk, as kumiss, or as confection, the call for dairy products is one of the most insistent, universal, and exacting of all the demands of trade. And in fact a necessity, a standard food, a common luxury, is the milk of the dairy cow.—Eugene Davenport.

LIME WATER FOR SEPARATOR

A writer in "Successful Farming," states that by the use of lime, it is possible to leave a separator unwashed after the evening milking, and keep it in good condition until next morning. As soon as the separator is done, take the machine apart, rinse it well in cold water, and then submerge all the parts in a thin solution of milk of lime. While this plan is not as good as cleaning after each skimming, yet it will serve the purpose occasionally. The milk of lime can be prepared by taking one-half pound of slaked lime and mixing with three or four gallons of water.

ALPHA

The Best Gas Engine to Buy



THERE is no economy in buying an engine that is going to require frequent repairs and that is likely to balk just at the time you need most to use it.

The wise man considers service, reliability and durability first, and price second. Selected on this basis, the ALPHA is the logical engine to choose, because it is the simplest and most durable in construction and the most reliable in operation. It runs smoothly and powerfully on a minimum consumption of either gasoline or kerosene, and operates on a simple magneto without the use of any batteries.

It is so simple that a woman or a boy can start and operate it, and the sensitive governor, which acts the instant there is the slightest variation in the load, insures steady running without any waste of fuel.

Before you put any money into a gas engine, investigate the ALPHA—and remember that the man who buys the best is never sorry.

Ask for catalogue, prices and complete information. Made in twelve sizes, 1½ to 28 H. P. Each furnished in stationary, semi-portable or portable style, and with hopper or tank cooled cylinder.

LIVE STOCK.

ESTIMATING PIG FFED

Q.—What will be the likely amount of bran and shorts I will need for two sows and 19 pigs. I am going to use a self-feeder and am going to seed one acre to clover and another to rape. Should the sorts and bran be mixed or fed separately? If mixed in what proportion?

A.—The following table gives the average amount of grain mixture eaten by average growing pigs when receiving a fullg rain ration:—

Age	Amt. of Grain
2-3 months	2 lbs. per day
3-4 months	3 lbs. per day
4-5 months	4 lbs. per day
5-6 months	5 lbs. per day
6-7 months	6 lbs. per day

Ordinarily brood sows require very little grain feeding after the litter is weaned, providing good pastur is supplied. However, when brood sows are maintained on grain feed alone, they wil lrequire at least two pounds of mixed grain per day for each 100 pounds live weight; that is, a' sow weighing 250 pounds live weight would require 5 pounds of grain mixture per day.

Two sows averaging 250 pounds live weight would consume between June 1 and Octobed 1 approximately 1,200 pounds of mixed grain. This amount however, may be reduced very considerably by the use of pasture. Nineteen pigs farrowed April 1 and weaned June 1 would consume, acocrding to the above table:—

June	1,140 lbs. grain
July	1,767 lbs. grain
August	2,356 lbs. grain
September	2,945 lbs. grain
Total eaten by young pigs	8,208 lbs. grain
Total eaten by sows	1,200 lbs. grain
	9,408 lbs. grain

I do not consider bran or shorts either mixed or fed separately a good grain for growing pigs. Bran is too coarse and bulky, while shorts fed alone is somewhat pasty. These two feeds when mixed furnishes little variety, but if these are the only two feeds tavailable, I would suggest that they be mixed in the proportion of three of shorts to one of bran.—G. W. Wood, Prof. of Animal Husbandry, Manitoba Agricultural College.

KEEP BULL IN GOOD CONDITION

Sentenced to solitary confinement and often without room to turn around is the fate of too many dairy herd bulls. Month after month some bulls are cooped up in stalls where fresh air and sunshine are shut out like alien enemies. True, many bulls don't deserve a living at all, and should not be allowed to eat expensive feed while our armies need beef.

A number of farmers are reinforcing their herds with young bulls from high producing dairy herds for the first time, this year. It is often with a smaller investment that a farmer can secure a pure bred bull calf which, in a few months, is ready for service. When he is six months old, the bull should be separated from the heifers. At ten or 11 months of age, most bulls are ready for light service. But, to be on the safe side, it is not advisable to breed a bull to more than six cows before he is a year old.

A ring is usually placed in the bull's nose at this time. Copper rings are preferred to gun metal, since copper is not so strong and would break before tearing out of the nose.

To keep the bull in good condition, successful dairymen recommend plenty of exercise. A box stall 10 by 12 feet and connected with a small yard fenced with heavy timber makes an appropriate place. Handling can be greatly reduced if a breeding pen is built off of one corner of the yard, and with a gate arranged so that when the pen is open the yard is closed. In this way the most vicious bulls are safely kept.

A well-fed bull develops greater size than an underfed one. For rapid growth, bull calves are fed somewhat heavier than heifers, and are allowed a liberal protein ration.

SMUT OF BARLEY POISONS THE CATTLE

In view of the fact that annual pasture mixtures are now quite commonly used and that barley forms a part of many of these mixtures it might be well to sound a note of warning regrading smut in this feed. In some fields sumt of barley is very prevalent this year and if the barley is headed out there is danger of smut poisoning in the cattle. The symptoms of the disease are rather vague, cattle may scour, become weak on their legs, and finally go down with what appears to be paralysis, death ensuing very suddenly from spasms of the pharnyx and smothering. The poison affects the nervous system and the heart as well. Cattle go down ond cannot rise Evidently the smut is more dangerous with cows about to calve or immediately fololwing calving. Anyone having cows on annual pasture containing barley heading out and in which there is considerable smut should taake tehm off to avoid danger of loss. There is little danger where the pasture is cropped off to cuh an extent that few or no heads appear. After a heavy rain which would wash all the smut away so that the leaves of the grain were free from it cattle could be returned to the pasture in safety.

CARE OF THE EWES AFTER WEANING

In order to avoid udder trouble it is necessary to keep a close watch of the ewes for a few days after they are separated from the lambs. Not a few cases of defective udders can be traced to the want of a little care in this respect. Milk out just enough to keep the udder soft the day after the lambs have been weaned. After two days time they are again milked out. Some ewes do not need any more attention after the second milking. Such ewes may be marked to indicate that they are dry. Three more days should elapse before the next milking is done and this method followed until it is certain the entire flock is safe. In conjunction with the method outlined above the ewes should be separated some distance from the lambs and be on scant pastures until all are perfectly dry. This is a good time to go over the flock and cull out all undesirable members. Non-producers and those with broken mouths and poor udders should not be retained. A good deal of the success of the subsequent lamb crop will depend upon the treatment the ewes receive from time of weaning until after they are bred. They should have good pastures and be given an opportunity of putting on flesh. This is what is commonly called "flushing." Nothing is better for this purpose than rape pasture. It is usually from six weeks to two months from date of sowing that rape is ready for pasture. If rape pasture is not available, new seeding or second crop of clover will serve fairly well. Stock should not be turned on rape or fresh clover for the first time when the leaves are wet from rain or even dew, in order to avoid trouble from bloating.—J. P. Sackville, B. S. A., O. A. C., Guelph.

FOUL FOOT IN CATTLE

Soreness of the foot in cattle, caused by a crack comingbetween the toes, is commonly known as "fouls." The infection which causes tahe disease becomes localized in the cleft between the toes and sets up an inflammation which is at first superficial, but has a tendency to burrow under the walls of the foot, causing very severe lameness and sometimes leading to the separation of the horny foot from the sensitive parts beneath. When the condition is first noticed the treatment is comparatively easy and consists in cleaning out the affected area and applying some antiseptic. Some cases in the early stages will yield to the repeated applications of turpentine. Tincture of iodine is more effective, and in those cases which are somewhat difficult to heal, a mixture of powdered copper sulphate and pine tar can be smeared on a small piece of cloth and pressed into the diseased area and then held in place by a mandage passing between the toes and around the foot. It might be advisable to soak this animal's foot in a warm 2 per cent. solution of creolin. The treatment should be repeated daily until the parts have healed.

THE PURE BRED RAM VERSUS THE SCRUB

It is a sound and well established principle in live stock breeding, that improvement must and can only come throuhg the use of the pure bred sire. Unfortunately this principle is either not generally known or else it is ignored and discredited. As an American Live Stock Publication aptly puts it when discussing a pure bred bull, "It is a bully good investment." The same applies even more forcibly to the pure bred ram as the following experimental evidence fully bears out.

At the University of Missouri Agricultural College is was decided to make a test of the relative merits of a pure bred mutton ram and a scrub ram when used on range ewes. Two lots of 17 range ewes identically alike were used in the experiment with the following striking results.

(1) The lambs from the pure-bred mutton ram at 3 months of age, weighed 3½ lbs. more on the average than did those sired by the scrub ram at 4 months of age.

(2) The lambs from the mutton sire sold at $7.35 per hundred—those from the scrub sire sold for $4.50 per hundred lbs.

(3) The quality of the wool of the offsprings from the pure bred sire was noticeably better than that from the stock sired by the scrub ram.

Theoretical Explanation Accounting For the Above Results.

Davenport, one of our leading authorities on breeding problems makes the statement, "Its the concentrated blood of the pure bred that prevails over the dilute blood of the scrub." This statement answers our question. The pure bred mutton ram was bred along mutton lines for generations. As a consequence this characteristic was well fixed or established in his blood. Naturally we would expect that his blood, when mingled with that of a range ewe of uncertain breeding, would predominate. This was the case his offspring grew faster, hence the reason why at 3 months they weighed more than those from the scrub at 4 months, also when put on the market, being much more typical mutton lambs they demanded the highest price per hundred pounds.

Why such poor results from the scrub? The scrub was an animal of very uncertain breeding, likewise the range ewes he was used on. On both sids the blood was dilute, that is to say the characters for any particular thing were not fixed. The result—an offspring without any definite characteristic e. g., lacking ability to make mutton fast, or lacking mutton conformation. Consequently the poor gains and the low prices obtained in the experiment outlined above.

A Business Proposition

There are pure breds and pure breds,, some good, some bad. Such striking results were secured in the above experiment due to the fact that a real pure-bred was used. If the $25.00 ram is good the $50.00 ram is better. Why? because he must be better bred and be a better individual, otherwise he would not command the better price. Such being the case he is more liable to impress his characteristics on his offspring. eHnce it becomes a business proposition to select the best ram that the individual can afford.

The casual onlooker at a livestock exhibit often disputes a judges placing of the stock. The judge made his placing keeping breed type in mind. Realizing that trueness to type means purity of blood and also concentration of blood. The onlooker considered "The biggest was the best." In selecting rams to head the flock this idea of type should be kept paramount. "Watch the type" then look to the cosntitutional vigor, size and, if possible, the history of the ancestry. If not able to get this then look at the other stock sired by the ram that sired he ram under consideration. Are they uniformly typical or is there different types in the flock? This means the old flock ram was not prepotent, i. e. not able to impress his characters on his offspring and probably his rams will not be able to either. In selecting the ram try to combine type, size and constitution.

The pure bred ram will prove just as "bully" an investment as the pure bred bull. If the size of the flock does not seem to warrant the expenditure of the money necessary to purchase one, then combine with a neighbor. In any case get the ram.—Thomas Hetherington.

FARMERS AND BREEDERS

Who wish to keep their horses and cattle strong and healthy, should always have on hand a supply of

OMAZON

The Canadian medicinal stock food for Horses, Cattle, Sheep, Hogs and Poultry.

It will help to economize on feed and owing to its sovereign tonic and curative virtues will keep the stock strong, healthy and free from many ailments.

Order from your dealer. If he hasn't it in hand, he will be pleased to obtain it for you.

RD. ED. MORIN & CO., Limited, Quebec, Can

OILING HOGS FOR LICE

I have had a good deal of experience in oiling hogs and consider that good oil properly applied comes about as near being a panacea for the ailments of the swine family as anything that may be used. It is of much importance that the skin and hair of the hog be kept in a healthy condition, and there is nothing I know of that will do this as effectively as good oil. In those cases where the skin is not in a healthy condition, the oil has a curative effect, and any lice or vermin preying on the animals are readily destroyed by it.

There are various ways for applying the oil, and the one which requires the least work on the part of the owner is the logical one to use. Some farmers who have a hog wallow simply pour a quantity of the oil on the surface of the water and depend on the scum of oil on top of the water coming in contact with the skin of the hogs as they wallow in the wallow. I do not like this method because too much oil is wasted and the hog is never oiled sufficiently to do him much good. Others apply the oil with a sprinkling pot, a spray pump, a brush or a broom, and I would rather apply the oil by one of these methods than not use it at all, but it is certainly no pleasant task to oil the hogs by hand, and there is always more or less waste of oil, besides the job is not usually done as often as it ought to be.

My hogs oil themselves by means of one of the patented hog oilers to be found on the market. The oiler consists of a horizontal iron roller, the bottom of which is submerged in a small reservoir of the oil. As the hog rubs against this roller there seems to be some kind of an inborn habit that causes him to revolve it in such a way that the oil coated surface of the roller rolls up against his skin anad deposits oil on that part of the skin in contact with the roller.

The oiler requires no attention except to keep oil in it, and there is no waste of oil. The oiler is so constructed that both large and small hogs can use it, and I know both find enjoyment in doing so. The hog is a great conserver of energy and he will not do anything that does not make him feeel more comfortable. The oiler can be set pu anywhere or moved from place to place, an dis ready for work at any time of the year. Whether one keeps few or many hogs he will find an oiler a good investment.

If, however, one does not buy an oiler, he should make some kind of an arrangement to oil his hogs at the minimum of trouble. This may be done by setting a post firmly in the ground and wrapping it securely with heavy strong burlap which is kept saturated with oil from an old paoil or vessel of some kind fastened on top of the post. The burlap extends into this vessel and draws ou toil on the principle of a lamp wick.

The kind of oil to use is a matter to be carefully considered. Ordinary crude oil is the cheapest and is used by some farmers, but there are some objections to its use. In hot weather it may burn and crack the skin for the same reason that kerosene does this, as the kerosene has not yet been entirely distilled out of the crude oil. A neighbor of mine who used crude oil in his oilers, said that his hogs licked so much of the oil that it affected some of them in such a way as to cause them to act crazy. I am of the opinion that the gasoline in the oil intoxicated them.

Another neighbor said that during a cold day in the winter he applied crude oil by hand to seven of his hogs and five of them diedly shortly afterward. The local veterinarian informed him that too free application of the oil in cold weather produced spinal congestion. The kind of oil I use is common lubricating oil. It has the same qualities of killing vermin and disease germs that the crude oil has, and there is no danger in using it at any time of the year.

Hogs should be kept so they are able to oil themselves as required. It is little trouble to make a simple oiler at home which will do the trick. Hogs free from lice thrive much better than lousey ones. If you doubt it, try oiling them and see.—By W. H. Underwood.

STARTING THE FARM FLOCK RIGHT

The very first problem of the beginner is to get good foundation stock. If he starts with unthrifty ewes, improperly bred for producing lambs and wool, he gets off on the wrong foot and he will pay a dear price for getting onto the right one. In a fit of discouragement he is likely to close out and "shut the door" against the sheep business. His experience will be no encouragement to those of his neighbors who may be thinking of starting flocks. If the beginner cannot find good ones now, he would better wait until they can be found, rather than start with the undesirable kind. Fortunately, however, it is not hard to get good ewes at reasonable prices this year, several factors combining to make prospects excellent for buying good ewes worth the money.

Desirable breeding ewes should possess certain fundamental characteristics. They should be:

(a) Well grown, healthy and spirited;
(b) Sound in mouth and milking organs;
(c) From one to four years old;
(d) Covered with dense coats of marketable wool;
(e) Uniform in size and breeding;
(f) Straight in body lines and showing capacity for feed.

In going about the buying of sheep, much the same precautions should be taken as apply in the purchase of any kind of breeding live stock. The health of the animals should be one of the first considerations. Good health in a sheep is indicated by lively, energetic movements; by a bright, clean skin, deep pink in color except in occasional specimens of the dark-faced breeds; and by bright eyes with plenty of red blood showing in the veins of the whites of the eye-balls. Pronounced emaciation, hard coughing, pale skin, dry harsh wool, and chronic scouring are indications of poor health. Ewes may eb thin because they have been suckling lambs and have not had enough feed. It is well to buy such ewes if they are otherwise desirable, but unthrifty ewes should not be purchased, for they may be infested with internal parasites which are hard to eradicate and permanently injure the health of the flock.

The teeth should be carefully inspected, especially if the ewes are over four years old. Even though the front teeth be intact some of the molars may be missing, or, worse still, they may be decaying and forming poisonous pus, the absorption of which may later cause the death of the animal.

The ewe's udder should be soft and pliable; the teats intact and free from hard cores. Sometimes shearers, accidentally or otherwise, cut off the ends of the teats. In healing, the milk channel is usually closed and the teat becomes functionless.

With respect to age, the ideal ewe for the beginner is the two or three-year-old. Ewes of this age are in their prime for producing both lambs and wool. Having raised one or two crops of lambs they have less trouble in delivering their lambs and they are better mothers than young ewes. Four and five-year-old ewes may be profitable for two or three years, but before a purchase is made they should be carefully inspected by a competent judge. As a whole, six-year-old ewes are on the decline in wool production and they are good for at most only two crops of lambs. Yearling ewes do not equal two and three-year-olds in the first year, but they are a better investment than old ewes because they are incerasing in their producing powers. As a practice, the breeding of ewe lambs is bad flock husbandry. They are too young to be good mothers and their development is likely to be arrested. It may pay now and then to breed well-grown ewe lambs born in February or March so that they will lamb in April or May, but they should receive the best of care during the pregnant and suckling periods.

The wool is a very important factor which too often is partly overlooked in selecting breeding ewes. A ewe yielding less than eight pounds should be discarded unless she is an exceptional producer of lambs. To get a fleece of this weight the body must be densely covered over with wool. Too often the purchaser does not see to it that the belly is well covered and that the wool extends to the knees and hocks, and also over the forehead and cheeks. We know of a case where the extension of wool over the body was overlooked and the ewes selected sheared less than three pounds each. The fleece should be even in quality and for farm flocks should grade from one-fourth blood staple to fine staple. In addition to its commercial value a dense, compact fleece, completely covering the body of the ewe, protects her health by keeping her skin dry and by lessening the effects of sudden changes in temperature. One should attempt to get ewes that are uniform in size and breeding for the sake of the greater value which results from the uniformity of teh lamb and wool crops.

The beginner can learn more about sheep from a small flock than he can from a large one. If he has a flock of twenty-five ewes it is easily possible for him to take note of each relative to her capacity for producing lambs and wool. He develops a conception of the type of ewe that is prolific, motherly, and able to produce enough milk to grow her lambs rapidly. By observing certain individuals from day to day he also becomes familiar with the habits of sheep and learns to know when they are slightly "off" in health. Knowledge gained in this way contributes much to one's ability to handle sheep successfully, for often a little attention will restore a sheep if it is taken in hand in the first stage of its illness, but if it is neglected until it no longer attempts to stay with the flock, the task of treating it is much more difficult.

But the beginner should buy enough sheep to justify giving them adequate attention.

ANOTHER GUERNSEY MAKES OVER 1,000 POUNDS FAT

Nella Jay 4th, former champion Guernsey in the junior-two-year-old class, has recently completed a record in her five-year-old form of 1,019.25 pounds of fat from 20,709.9 pounds of milk. This is the third highest butter record ever made by a Guernsey and the second highest milk record. She is the fifth Guernsey to produce over 1,000 pounds of fat in a year.

Divide the milking among the family. It takes a long time for one man to milk eight or nine cows, but if three people milk three each, the work is soon finished and agreeable. Children must help a great deal this year, too, and can be taught to do milking quite effectively.

THE HORSE

DRAFT HORSE BREEDING THAT WILL COIN MILLION OF DOLLARS FOR FARMERS

Breeding the best class of heavy draft horse is not getting its due share o fattention in many districts of Canada. "There is no money in horses," is only true in countries that neglect hor esbreeding. If there is no money in rearing the best class of horses, there is certain loss in rearing the common and undersized, and the latter class is the rule with too many farmers. A whole day's touring by car last week in one of the reputed fertile areas of Ontario by the writer, did not reveal one horse of the stamp that would encourage any horse buyer who is alive to the requirements of the time in horse flesh.

The High-Priced Horse

The reason is not far to find how it is that Canadian farmers meantime fail to get a share in the millions of dollars that all the Allied Governments are spending for the motive power as it is found in the best class of draft horse. Not a horse to-day is being bought in Canada, and why? Reports from Britain just now when the local district horse markets are on, are proving that there is a world wide demand for the draft horse. Even for local purposes at city or farm, geldings between the ages of 4 and 5 years are readily being picked up at $1,000 each. For export to Australia and South Africa the demand for breeding animals is also very keen, and some of the finest types and best blood lines are finding their way to these colonies. This is not the result of war conditions, for long before the war the best class of horses were realizing thees high values. If on every farm there were high class horses, then there would be a higher standard of values and keen competition between countries. Without a steady supply of the class of horse wanted there can be no steady demand.

Before a county or district comes out on top in any department of its industry it has to enter the list of competition and have higher ideals of attainment than its rival. Without the article there can be no market, hence the fate of the horse industry as it is witnessed in too many districts in Canada today.

How It's Done

In starting to breed the draft horse on lines that will prove profitable and lasting, the young beginner should seek to gather information from experienced constructive breeders. It is to be regretted that not more of these breeders are to be found in every rural community of Central Canada. A few are found to be doing good work, but they are isolated from lack of interest by the rank and file that surround them. It is unfortunate that the cheaper class of animals are more profitable to importers than better ones. This is due to the penny wise and pound foolish policy of the average horse breeding farmer. An inferior stallion gets more patronage than a good one, if they stand for a few dollars less service fee. The average farmer fails to realize that $5.00 in service fees often means $100 difference in the price of a horse at maturity, and sometimes even more than this sum. A good horse eats no more tha nan inferior one. Too often the good dam is sold, and only the one that won't sell is kept and these are no good even though the best sires are available for them.

The two main factors in making a right start in horse breeding is the quality of the foundation stock and the healthy surroundings given them. Heredity and environment are the two outstanding features that no horse breeder, experienced or beginner, can ever afford to neglect. Of the two, the last is the most important. It is not often recognized as such, or receives the attention that is given to heredity and individual quality. How often it can be noted that a farmer is disappointed at the results of buying high priced animals of accredited good parentage, to improve his stock. The breeding with them may be along correct lines, but feeding and general care has not been along the lines of highest development. Take a pure bred cow, rich in the best blood of several generations, and give her poor feed and treat her c.fspring the same, and the results are well known in dairying as ruinous. Even high class wheat or other improved grain will quickly fall to its original state if planted in poor soil that is badly cultivated.

The work that brings out the best in breeding must be continued by all those who wish to attain similar or higher places in the art. This is particularly necessary in horse breeding, as this species is of a highly strung temperament.

The Basis of Success in Breeding

A sound animal is the basis of a right start; one sound animal is better than a dozen of unsound ones. Unsoundness is carried from one generation to another. In founding a farm stud a common mistake made by the beginner is buying here and there a good mare that particularly takes his fancy. This he does without paying much attention to the line of breeding any of his purchase holds, and if he does the same in the selection of his stallions the results are far from satisfactory. There is a mixture of blood lines that entirely upsets the work that brought the breed to its high level.

Before anyone can succeed in breeding horses or live stock of any kind they must get alive to the methods that expert breeders use to bring the best results. Buying indiscriminately and breeding on the same lines will soon discourage the most ardent enthusiasts. Enthusiasm can only be upheld by intelligence. It is part of the farmer's work that must get more attention in the future; it affects all species of farm animals, whether grade or pure bred. Keep on breeding on lines that bring out uniform animals, and be very careful when introducing any new blood in the line.

There is no haphazard work in producing and rearing the high-class uniform horse that the world's markets demand today. Have a foundation stock of uniform pattern and ancestry and keep to them and their blood lines; mixtures of other lines have a diverse affect on the uniformity and quality of the progeny. There are some animals of fairly good merit that one is tempted to buy on sight, but if their parentage does not measure up to a record of high standing merit then it is better to leave them alone. Especially is this characteristic found amongst stallions. An animal well grown, fat, and in bloom gets the eye, but if these are the only qualities that recommend him leave him alone. Remember that an individual, however good to appearance, has little chance to transmit anything better than what is found in the history of the parents.

The advancement of the horse breeding nidustry does not interfere with any method of farming, dairying, mixed or grain farming; all can undertake the work of horse breeding with advantage. Every farm requires some horses and the marketable horse is the one to breed. Unsaleable horses are a loss, even though they do manage to produce all the motive power on the farm. With suitable foundation stock and with natural conditions of development foun din Canada, the successful production of high class horses lies within the power of every Canadian farmer. The knowledge requisite for carrying it on is easily attained and the opportunity knocks at the door of every farm. To produce the rugged drafty colt that finds a ready asle anywhere, breed with the mares of good type, excellent in set of legs, good feet and with parentage of good producers. Have no break in the long continued use of good sires and there will be no breakdown in the horse industry. such as Canada is witnessing today on its otherwise fertile areas.

ABSORBINE STOPS LAMENESS

from a Bone Spavin, Ring Bone, Splint, Curb, Side Bone, or similar troubles and gets horse going sound. It acts mildly but quickly and good results are lasting. **Does not blister or remove the hair** and horse can be worked. Page 17 in pamphlet with each bottle tells how. $2.50 a bottle delivered. **Horse Book 9 R free.**

ABSORBINE, JR., the antiseptic liniment for mankind, reduces Painful Swellings, Enlarged Glands, Wens, Bruises, Varicose Veins; heals Sores. Allays Pain. Will tell you more if you write. $1.25 a bottle at dealers or delivered. Liberal trial bottle for 10c stamps.

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Gombault's Caustic Balsam will give you immediate *Relief.* A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam

The Great French Remedy Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that." —Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

Price, $1.50 per bottle at all Druggists or sent by us express prepaid. Write for Free Booklet and read what others say.

HOW HORSES FARE ON FARMS

Horses fare worse on farms than in cities, according to the Boston Work Horse Relief Association. This indictment may apply to Yankee farmers, but we doubt it. The following is a statement contained in a recent "appeal to owners of work horses":

"Beware especially of selling or giving a horse to go on a farm. Farmers in general feed their horses less grain, and take less care of them, than any other horse-owners in the world."

It is probably true that farmers feed less grain and spend less time on their horses than do city owners, but this does not imply poor care, nor indicate that a horse on the farm must endure more hardship than in the city. The fact is that a horse is at his best in good pasture with nothing to do and no grain. That is nature's kind of care and the horse likes it. On the farm he gets lots of it between jobs and in wet weather. Grass is cheaper than grain, and a good roll in the dust is cheaper than a currying.

It is not fair to farmers to characterize this kindness as neglect. Even the stalkfield fare that many horses get just now does not offer a fraction of the hardship that city horses undergo at this season. With shoes off and on secure footing farm horses wander about the stalkfields as they please, picking out the best bites of forage. To be sure it is not very nourishing but it furnishes heat and a grown horse lives on it comfortably in an ordinary winter. The city horse must do the best he can to stay on his feet hauling heavy loads over icy streets. He must have grain and blankets, and yet he does not fatten any faster than the country horse. If the blanket is not thrown on promptly when the city horse stops he shivers with the cold, but the long hair of the stalkfield rover protects effectually from winter temperatures.

And yet farmers could profitably give their horses better care than is sometimes offered at this season. Stalkfield picking gets steadily poorer as the winter advances. A little grain or hay is needed to pad out the bill of fare and to keep horses from losing flesh. It does not take much extra feed now to show plainly in the condition of horses by spring. At that time, when hard work begins horses must carry a fair amount of fat or else they will shrink away rapidly when changed from idleness to activity.

WHY SOME HORSES DO NOT SWEAT

Horses and mules are probably being worked harder and longer hours than ever before. They must receive good attention, especially during this hot weather, if one wishes them to do this hard work and remain in good shape. Often a mule or horse fails to sweat. This may cause considerable trouble. Dr. C. A. Cary, state veterinarian and dean of the Veterinary College at Auburn, gives the following information on the subject:

"Horses, unlike most animals, excrete serum albumen and globulin proteids in the sweat. Why horses thus excrete albumins is unknown, yet this in part explains why horses that sweat very freely become greatly reduced in vitality and strength. Clipping when the hair is long is said to be the only preventive of excessive sweating. In the sweat of the horse there is about five per cent. of ash (salts). When the hair becomes short or the long hair is shed or thrown off the 94 per cent. of water evaporates more rapidly than when the hair is long. Rapid evaporation or evaporation of sweat as fast as it is secreted is called insensible perspiration.

In the summer when large quantities of new hay, new oats in the straw, or uncured hay is fed to horses there appears to be something in these imperfectly cured hays or feeds that stimulates rapid respirations and retards sweating. The rapid respirations may in part be due to the bulky stomach or abdomen pressing on the diaphragm and preventing abdominal breathing. Rapid respirations may be due to over work or exhaustive work.

Retarded or decreased sweating may indirectly stimulate respirations as it always does stimulate the kidneys. When a horse is not well groomed or bathed the salts and proteids collect and close up the openings of the sweat glands. Hence, to prevent the so-called non-seating horse or mule and the associated rapid breathing it becomes necessary to:—

1. Keep the ducts of the sweat glands open by frequent grooming with good brush and bathing in warm weather once a week.

2. Feed hard worked horses less bulky, uncured hay or forage or pasture. The English hay for the long-winded, hardy race horses is cured not less than two and often three or four years before it is fed. Always feed horses not less than three times a day and in small quantities of a balanced ration.

3. Over work, exhaustive work and especially very hard or rapid work in the warm, sultry weather may have a mechanical action on bursting or rupturing the air sacs of the lungs and producing a permanent case of heaves.

MARE REFUSES TO TAKE TO HER COLT

I have a mare that refuses to take her colt. I am feeding the colt cow's milk; what amount can I use and how often should I feed it? T. C.

Young colts can be successfully raised by the hand provided sufficient care and kindness is exercised. It is impossible to specify exact quantities of milk, sugar, etc. to give, because young colts differ so much in capacity and vigor. What would not be sufficient for one might be too much for another. From personal experience the writer has found that a young colt is quite easily taught to drink. It is not advisable to use artificial teat or bottle. Feed it four or five times a day. Make it your last duty at night and first duty in the morning. Your judgment as to quantity wi l be gauged by the general appearance of the colt and especially the state of its bowels. From two to three pints of cow's milk, diluted with warm water, to which a little sugar is added, just as sweet as the average tea drinker insists upon, will be about the correct quantity at each meal for a start. As the colt gets older, increase the quantity as your judgment by observation will lead you. Three times a day of 10 to 12 lbs. of whole milk at each time will generally suffice without the sugar and water. If there is any sign of constipation give two ounces of castor oil occasionally in the milk, as a preventive. When three weeks old, train it to eat a handful of dry crushed oats and linseed meal mixed twice daily. Three parts of oats to one part linseed. Train it to lead so that it can be led to grass. When in the barn, give it green feed, grass and clover, but not alfalfa.

CURING SWEENIED HORSES

A number of letters have been received asking for a cure for sweeny. The general treatment for this disease is to lay the horse off work immediately he becomes sweenied. He should not be worked for several weeks. This gives the muscles of the shoulder a rest and helps them to fill up again. To assist in hastening a cure the muscles of the shoulder should be thoroughly rubbed every day with a good liniment, such as camphorated liniment, which can be obtained at the drug store. Several excellent remedies for the same purpose are advertised in the coulmns of this paper.

THE FARM HORSE

The best farmer's horse is not a horse of fancy stunts. He is just a good steady worker, kind and patient, able to do an average day's work every working day in the year, trustworthy in the hands of most any "Tom, Dick and Harry" you hire. And when ready for the market he brings a profitable price; all of which beats the halo that hangs over the race track, and helps to win the war.

E. M. TIMBERLAKE.

Horsemen Attention !

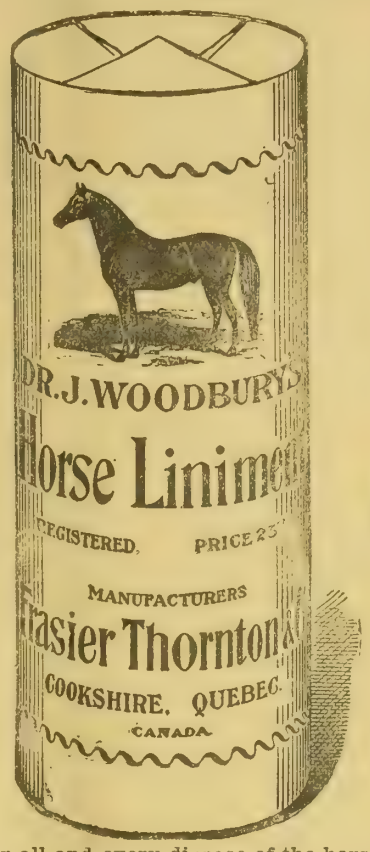
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsement of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

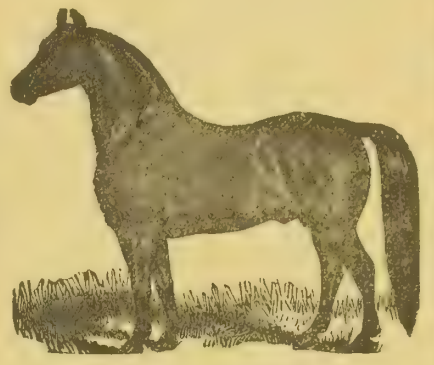
FOR SALE ALL DEALERS

PRICE 25 CENTS



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

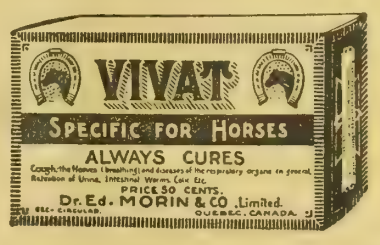
DEMAND
DR. J. WOODBURY'S
HORSE LINIMENT



AFTER USING

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

The Recognized Specific of Diseases of the Horse



A sovereign remedy in powder form which cures, Coughs, Heaves, Colic, etc. It strengthens the work horse as well as the race horse, and enables them to do more and better work. It has been successfully prescribed by many veterinarians notably by Dr. J. D. Duchene, in many critical cases, where results have proved remarkable.

A 50c box will be sufficient for six days' treatment.

JUDGING HENS FOR EGG PRODUCTION

(By W. . GrahamR, B.S.A., Professor of Poultry Husbandry, Ontario Agricultural College

A system has been adopted by the American Association of Instructors and Investigators whereby hens may be judged during the summer months in regard to their laying capacity. This organization, including both Canadian and United States instructors and investigators, constitutes the American branch of the International Association, the British branch of which embraces England, Ireland and Scotland. The system is of special use for culling flocks during July, August and September, more especially as the moulting season is approaching. The system was adopted at a meeting of the Association held at Ithaca in July this year.. Following are the characteristics of a good laying hen and a description of the indications by which she may be distinguished from others as laid down by the Association:

In order to lay well a bird must have a sound body. As a first consideration a bird must be vigorous and healthy if it is to be able to lay well. Vigor and health are shown by a bright, clear eye, a well set body, a comparatively active disposition and a good circulation.

Further, the bird must be free from physical defects such as crooked beak, long, excessive toe nails, eyelids that overhang so that the bird cannot see well, scaly leg, or anything else that would keep the bird from seeing or getting an abundance of food.

Loss of fat due to laying:—Color or pigmentation changes. (These should be observed by daylight.)

A laying fowl uses up the surplus fat in the body, especially it removes the fat from the skin. In yellow-skinned breeds this loss of fat can readily be seen by the loss of the yellow color. The different parts of the body become white, according to the amount of fat stored in the body and the amount of circulation of blood through the part. The changes occur in the following order:

The vent changes very quickly with egg production, so that a white or pink vent on a yellow-skinned bird generally means that the bird is laying, while a yellow vent means that the bird is not laying. tI should be recognized that all yellow color changes are dependent on the feed, coarseness of skin, and size of bird. A heavy bird fed on an abundance of green food or other material that will color the fat deep yellow will not bleach out nearly as quickly as a pale, yellow bird.

The eyering, that is the inner edge of the eyelids, bleach out a trifle slower than the vent. The ear lobes on Leghorns and Anconas bleach out a little slower than the eyering, so that a bleached ear lobe means a little longer or greater production than a bleached vent or eyelid.

The color goes out of the beak beginning at the base and gradually disappears until it finally leaves the front part of the upper beak. The lower beak bleaches faster than the upper but may be used where the upper is obscured by horn or black. On the average colored, yellow-skinned bird, a bleched beak means heavy production for at least the past four to six weeks.

The shanks are the slowest to bleach out and hence indicate a much longer period of production than the other parts. The yellow goes out from the scales on the front of the shanks first and nallfiy from the scales on the rear. The scales on the heel of the shank are thelast to bleach out, and may generallybe used as an index as to the natural depth of yellow color of the bird. A bleached-out shank usually indicates fairly heavy production for at least fifteen to twenty weeks.

The yellow color comes back into the vent, eyering, ear lobes, beak and shanks in the same order that it went out, only the color returns much quicker than it goes out. A vacation, or rest period, can sometimes be determined by the end of the beak being bleachedand the base being yellow.

Body changes due to laying:—

A laying hen has a large, moist vent, showing a dilated condition and looseness as compared with the hard, puckered vent of a nonlaying hen.

The whole abdomen is dilated as well as the vent so that the pelvic archesare widespread and the keel is forced down, away from the pelvic arches so as to give large capacity. The more eggs a bird is going to lay the following week the greater will be the size of the abdomen. The actual size is, of course, influenced by the size of the eggs laid and by the size of the bird.

Heavy production is shown by the quality of the skin and the thickness and stifiness of the pelvic arches. Fat goes out from the skin and body with production, so that the heavy producers have a soft, velvety skin that is not underlaid by layers of hard fat. The abdomen in particular is soft and pliable. The sternal processes are very prominent and are generally bent outward . The thicker and blunter the pelvic arches and the greater the amount of hard fat in the abdomen, the less the production or the longer the time since production.

One of the finer indications, but yet one of the most valuable in picking the high layer, is the fineness of the head and the closeness and dryness of feathering. The head of a high layer is fine. The wattles and ear lobes fit close to the beak and are not loose and flabby. The face is clean cut. The eye is full, round, and prominent, especially when seen from the front. The high layer is thinner, that is, the feathers lie closer to the body, and after heavy production the oil does not keep the plumage relatively sleek and glossy, but the plumage becomes worn and threadbare.

Changes in secondary Sexual Characters:

The comb, wattles and ear lobes enlarge or contract, depending on the ovary. If the comb, wattles and ear lobes are very large, full and smooth or hard and waxy, the bird is laying heavily. If the comb is limp the bird is only laying slightly, but is not laying at all when the comb is dried down especially at moulting time. If the comb is warm it is an indication that the bird is coming back into production.

Moulting.—When a bird stops laying in the summer she usually starts moulting. The later a hen lays in the summer, or the longer the period over which she lays, the greater will be hei production, so that the high producer is the late layer and hence the later moulter. The length of time that a he nhas been moulting, or has stopped laying, can be determined by the moulting of the primary feathers. It takes about six weeks to completely renew the primary feather next to the axial featheds, and two weeks more for each additional primary to be renewed.

Temperament and Activtiy:—

A good layer is more active and nervous and yet more easily handled than a poor layer. A high layer shows more friendliness and yet elusiveness than a poor bird. A low producer is shy and stays on the edge of the flock and will squawk when caught.

While the characteristics discussed have dealt specially with the current year's production it should be born in mind that a high producer one year is, generally speaking, a high producer in all other years.

TUBERCULOSIS IN HENS

Tuberculosis is a disease affecting only old birds, or stock that is fully matured. The germs of this disease may be in the ground surrounding the poultry house, or in the house itself. They gain entrance through the food, drinking water, or by breathing. Birds suffering from this disease void the germs in the droppings, and these getting mixed with the feed are taken into the system, and thus it is transmitted to the rest of the flock. The symptoms of the disease are a pale comb, rapid loss of flesh, usually diarrhoea, and in the latter stages the bird will be lame in one leg. The bird may die in the course of a few daysdays, or it may linger fos three or even four weeks, in which case it will be practically nothing but skin and bones. On opening the bird the liver and spleen will be found to be covered with raised whitish spots, varying in size from a mere point to half an inch in diameter. In very extreme cases tubercules may be found along the entire alimentary canal, and also on the bones in various parts of the gody. Unlike human or bovine tuberculosis ,the lungs are very seldom affected.

There is no cure for the disease. It is simply a question of keeping it in check as much as possible by observing cleanliness in all details of poultry management. Kill off all the sick or affected birds and bury them deeply and cover with lime; or, better still, burn them. Clean out the hen house

thoroughly and whitewash it with whitewash having five per cent carbolic acid added to it. Clean out and disinfect all the nests, drinking pans and so on. Put in a layer of fresh earth, sand or gravel, and use an abundance of air-slaked lime under the roosts at all times. The land surrounding the poultry house should receive an application of air-slaked lime, be cultivated, and a crop grown on it. Provide plenty of light in the hen house, and feed only good wholesome foood. The disease is seldom met with in the winter time, but is usually most active in the late summer months. While the disease cannot be cured, still, by following these suggestions, itmay at least be kept in check to a certain extent.

TO INCREASE EGG PRODUCTION

Hens cannot produce eggs profitably on grain alone. The grain ration must be supplemented by protein concentrates. Recent investigations show that the source of protein also influences egg production. That is, protein concentrates of animal and vegetable origin differ in ability to stimulate laying. A series of tests have been conducted at the University of Missouri College of Agriculture to determine the realtive efficiency of animal proteins, represented in experiments with meat scrap and sour milk, and vegetable proteins, represented by oil meal, gluten meal and cottonseed meal, in rations for egg production. Feeding tests have shown that

1—Meat scrap and sour milk are the most economical sources of protein for laying hens.

2—It is poor economy not to furnish the laying hen a protein concentrate of animal origin.

3—Vegetable proteins alone cannot be fed economically.

4—Twenty-five pe rcent meat scrap is a sufficient amount of animal food in a dry mash.

5—There is no evidence that vegetable proteins, alone or in combinations with animal foood, increase egg production.

6—One pound of eggs can be produced with every four pounds of feed if the proper ration is fed.

7—According to these tests, 100 pounds of sour milk is worth 5.4 pounds meat scrap.

RETAIN IN FLOCKS ONLY LAYING HENS

It is a great advantage as well as profitable, to know the hens that do the most laying. While with pure-bred stock there is more difficulty in distinguishing on efrom another, still I have quite often noticed that even though the markings are similar, yet each fowl seems to have a distinctive individuality. Sometimes a hen will show this in her actions, or the formation of her body may hely distinguish her, even her eyes or head.

The use of trapnests and leg bands is probably the best ways to determine accurately which are the best all-round layers in the flock. However, where we have only a comparatively small number of pure-bred hens, say 50 or 60 fowls, and are quick, keeen observers such markings are not absolutely necessary. A good laying hen will set upon the nest for some time while laying, and by giving the nest boxes a certain amount of attention it is hard to pick out th ebest layers in the flock and through their individuality distinguish them from other members of the flock.

Some hens, of course, will lay very few eggs during the season, while others after laying a small number of eggs will become broody, which is not always a desirable trait, and still others of the flock will continue to be prolific layers. It is quite profitable where fowls are under no strict supervision and are perhaps more or less on range, laying at all seasons as they please, that fully a third or more of their number could be disposed of to advantage and a good expenditure in the way of feeds and other items could be saved. Considering the high prices prevailing for feeeds anad also the scarcity of some feed materials, I believe it would be a great help to observe and retain only those in the flock that are paying their way, the others being, of course, disposed of to best possible advantage to the owner. —H. W. SWOPE.

CULL THE PULLETS AND GET MORE EGGS PER HEN IN WINTER

In these days when food conservation is the slogan of the world, we should plan to save on the poultry feed as well. This can best be done by very close culling. The town lot poultry keepers generally get more eggs per hen, on an average, than the farmers. They are obliged to cull very closely because they cannot afford to give space and feed to a worthles hen. The farmers, as a rule, kill or sell the surplus cockerels, some of the old hens, and keep practically all the pullets they haise. If they kill one for the table it is always the big thrifty one and never the cull. Here is where they make a great mistake anda lose much of their profit.

My experience with trap nests for the past four years has proved to me that at least one-fourth—better one-third—of all the pullets I raised should have been marketed before they began to lay. While the young stock is still in the coops it is very easy to go through each flock and culll out the weaklings. There will be one or more pullets in each brood which are decidedly weaker than the strongest.

The chick which was stunted by lice, gapes, bowel trouble, or other cause, is very easily culled out when young, but after once beginning to lay that pullet is lost sight of and the chances are you will keep her two or three years. She will always be a poor layer and the sooner she is sold the better.

My trap nest records are incomplete covering only seven months of each year, from October 1 to May 1, but even this gave me some information of value. The first year I found that one-fourth of my flock had not laid enough eggs to pay for their feed. Most of these were pullets. The first ten pullets that began to lay were the best layers during their second year as well as their first. Less than half of my flock had paid me a worthwhile profit, and yet they were doing better than any of my neighbors' hens. This is something worth thinking about.

Farmers usually make no attempt to get winter eggs, and every little pullet is kept because none of them will lay till spring anyway and the runts will be as goood as the rest by that time. I find that the winter-laying pullet is always about four dozen eggs ahead, and lays as well as any in the spring. It is very easy to go through a flock of pullets in October and pick the ones which will begin laying inside of two months. Mark them in some way so that you may be able to keep them a second year. A hog ring put o none leg is the best way of marking. These hens, if carefully selected when pullets, will be profitable for two or three years.—Ida Phillips.

PEERLESS PERFECTION
The Fence For Real Protection
gives life time service. Is made of the best Open Hearth steel fence wire, all impurities burned out, all the strength and toughness left in. Makes the fence elastic and springy. Will not snap or break under sudden shocks or quick atmospheric changes. Galvanized to prevent rust and the coating will not flake, peel or chip off. Can be erected over the most hilly and uneven ground, without buckling, snapping or kinking. Every joint is locked together with the well-known "Peerless Lock." The heavy stay wires we use prevent sagging and require only about half as many posts as other fences.
Send for catalog. It also describes our farm gates, poultry fencing and ornamental fencing. Agents nearly everywhere. Agents wanted in unassigned territory.

Winnipeg, Manitoba Hamilton, Ontario

MOVING PULLETS TO LAYING QUARTERS

When moving mature pullets from colony houses and free range to winter laying quarters abrupt changes must be avoided or considerable trouble may be started. Crowding and poorly ventilated houses will start cold and croup in the flocks. If the quarters are infested with lice anad mites from previous inmates the pulllets will suffer a setback in development, and laying will not begin until late in the year. Provide plenty of roosts not too high up and do not allow any of the fowls to roost on the floor. We accustom our pullets to their winter quarters in the following manner:

The laying houses are cleaned and whitewashed and the floors covered with clean straw. The colony houses containing the young stock are gradually moved up close during summer and along in August we start to scatter the pullets' feed close up to the laying house doors and inside in the litter. After a short time the whole flock is scratching inside for their grain food each day. Then when we get ready to make the change all that is necessary is to close up the laying house at meal time and the pullets are securely housed in accustomed quarters with none of the fuss and excitement usually experienced in catching and moving flocks.

FOWLS OF UNIFORM COLOR AND SIZE

To obtain a flock of vigorous hens, uniform in color of skin and shanks, capable of producing a maximum number of eggs of the same shape, size and color, the farmer has only to purchase a breeding pen of birds of some particular strain on any one of the general-purpose American breeds. One strain of the breed selected for its ability to produce eggs and dressed poultry should be chosen for each flock, and that flock should never be contaminated by mixing with any other strain or breed of fowls. All the fowls of one particular strain will lay eggs that will be very much alike in size and color; when dressed for market the fowls will be alike, and no poultry products command a better price in the market than fowls of uniform color of skin and shanks, and eggs of the same size, shape and color. Thus by standardizing his flock the poultry keeper will increase the efficiency and profit-earning powers at least twenty-five per cent, and at the same time provide his customers with the highest quality of poultry and eggs. —C. B. Ford, Kent Co.

When a man takes office he is sworn in, but he has to do the swearing himself when he goes out.

DRILLING HARD STEEL

The following preparation will aid in the drilling of hard steel used on automobile construction. Mix one part spirits of camphor with four parts of turpentine. After the mixture has been applied to the part to be drilled and allowed to dry an ordinary drill may be used.

IF I HAD KNOWN

If I had known what trouble you were bearing,
What griefs were in the silence of your face,
I would have been more gentle and more caring,
And tried to give you gladness, for a space,
I would have brought more warmth into the place—
If I had known.

If I had known what thoughts despairing drew you,
(Why do we never try to understand?)
I would have lent a little friendship to you,
And slipped my hand within your lonely hand,
And made your stay more pleasant in the land—
If I had known.

THE PRETENDER

By Katharine Holland Brown

For a long hour Mrs. Tuckerman had sat at her narrow, exquisite, old spinet-desk, in her narrow, exquisite, old drawing-room, her son's letter held in one cold hand. She had never once glanced at that letter. Instead, she had stared away down Mount Vernon Street, at the silver panel of the Charles. But written broad on that page of flashing water every word of her boy's message stood out, sharp and clear. Two weeks ago she had torn open that eager scrawl. Today its phrases were graven on her soul.

"Aboard the Chicago Flyer, just out of Cheyenne.

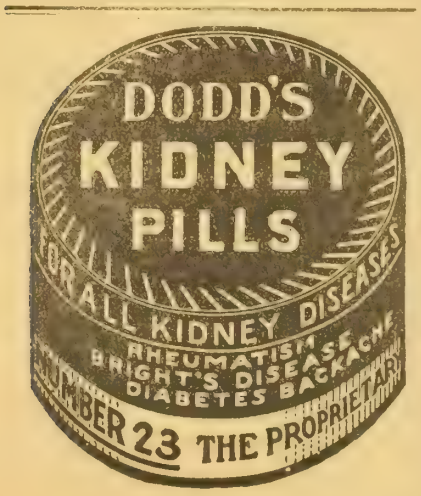
Tuesday, the fourth.

"To Mrs. Edward Carew Tuckerman,
1118 Mount Vernono Street,
Boston, Mass.

"Dear Mother:

"Your letter caught me as we boarded this train. When I'd read it, I felt like a sneak. Here you are, believing that I'm settled at Stanford for the year. Here I am, starting to France this minute. And that's only half my story. But what's done is done. I wouldn't undo it for anything in this world. Believe me!

"Remember the bargain you made, last spring, when war was declared, and I wanted to chuck Tech, and beat it straight over, and join the escadrille? You promised if I'd stick through my senior year, at Tech or at Stanford, either one, that you'd give full permission. Well, I didn't make any promises. Yet I sure meant to hang on at Stanford and get my degree. But now—listen.



"Vacation week Len Carter and I spent at Monterey. The Pells were at the Del Monte, and Len wanted to see Eugenia. I wasn't pining for Eugenia, but I did want to see Elsbury—Frederick T. Elsbury, you know, the wiz who has just worked out a balancing device for scout planes. Outsiders aren't welcomed at his hangar, but I breezed in regardless, and didn't he let me try her out the very first day! I made three rather smooth flights, and Elsbury jabbed that gimlet-gray eye into me and told me where every fellow who can handle a plane ought to be, and told me good and plenty. When I said I was waiting to finish my senior year, he didn't say another word. Just screwed up those queer, peaked eyebrows and looked at me. That look got under my hide. Dare say that's one reason—but wait till you hear the rest.

"Right here I will observe that Len's Eugenia was not the sole ornament of Monterey. The Sidereal Pictures had a company up from Los Angeles, making the 'Hazards of Heloise," with Monterey reefs and precipices for backgrounds. Aimee Adare was starring, but you don't catch Aimee risking dents in that peerless profile on the stunts. Not she! Instead, she sat on the Del Monte piazza and looked like a pink-candy angel, while her double wrestled through blinding surf, or leaped canyons, or fought hand-to-hand with seventeen German spies at once. Naturally her doubles didn't last long. Two quit on them the day we hit Monterey, and they sent in a hurry call to Los Angeles for a third. But when that third girl struck camp, even the director stopped cussing. For that third double was something else again.

"Genevieve Lang, her name was. She's a little slim thing, not nineteen yet, and awfully quiet and shy. She's all browny-gold, hair and eyes and lashes, but her cheeks are burning pink under the tan, and she's got the prettiest teeth I ever saw, white and even as corn, and her hands and feet are simply peachy. She was awfully excited to be understudying the heaven-born Aimee, but she handled her part as if she'd rehearsed it a year. And not even that thug of a Sidereal scenario man could think up a stunt that would faze her. Pluck? It's her middle name. Stubborn? That little shy thing didn't know when to back down. No matter what crazy risk they'd ask, she'd go to it like a pup for a steak-bone. And if flesh and blood couldn't put it through, she'd bluff it through. Yes, ma'am. Bluff it. Bluff it so vividly that you'd gasp and gulp while the camera was grinding before your eyes.

"Aimee the Great began to get edgy. As for the Sidereal boss, he'd stare at that little cool thing when they were slinging her off a runaway engine or locking her into a burning log cabin, and he'd grip his fat hands and sigh: 'Und, on the screen, will she double to our dear Aimee be? Double? She will be one riot.'

"However, he has another guess coming. Genevieve won't double for Aimee. Never again. Because her last big stunt was to let the chief lash her wrists together, then heave her overboard off a yacht. The cords were supposed to drop off the minute she went under. But the chief had tied his knots a bit too tight. Instead of sliding off, they held fast.

"She went down, came up, went down again, came up one fighting second—and we saw the breath was all but out of her. Even then, mother, I saw that little brave thing thrust her lashed arms toward the camera. She couldn't put the scene through according to schedule, so she was bluffing it through, see? Courage? She wrote it!

"Oh, I dare say she thought some extra would hop in and grab her out in time. But nobody hopped. The whole cast just stood pop-eyed. Paralyzed! And the undertow was sweeping that helpless kid straight against the piers of the whart. Another minute and she'd have been snatched down, trapped in that bottomless mud and slime—Gosh, it makes me sick to write about it!

"Well, it was all over quicker than I can put it down. I was standing on the wharf when the chief tossed her overboard. At first I didn't see her danger. When it did dawn on me, I kicked ffo my shoes, dived off the wharf, and came up twenty feet away. Genevieve was just going down for the third time. Maybe I didn't beat it over to her!

"I got a good grip on her and yelled for a rope. At that the gang came out of its trance. I got the rope pronto, likewise a hail of life-preservers. But that undertow was quicker yet, and it swept us both under the piers, and jammed my head against a timber and gave it a jolly crack. However, I'd got a strangle-hold on the rope, and they yanked us out with one tremendous jerk.

"Genevieve was pretty limp, but she managed to say, 'Thank you,' quite the lady, before they carted her off to the hotel. I got a doctor to put a couple of stitches in my head, then washed my face, which needed it, and slept all afternoon. That night I went up to see how Genevieve was making out. She came down-stairs with her hair all crinkly from the water, looking a bit shaky but serene as you please. First thing she said, was: 'The camera-man says he got in enough drowning struggles for three first-rate flashes. It wasn't what the script called for, but anyway we bluffed it through. Aren't you glad your rescue didn't spoil the stunt?"

"'Delighted,' said I. Somehow that got me where I lived. The funny, honest ltitle gink! Any other girl would have been goozling over my broken head, all tied up so noble and pathetic. To her my cracked skull was all in the day's work, along with the bruise on her check-bone, and her black-and-blue wrists. It was up to her to bluff her part, and she'd bluffed it. I had happened in to give her a hand at the fade-out. That was all.

"Well, I sat down, and we talked. By the time we'd talked an hour, I felt as if I'd known her my whole life long. Longer. She said she felt the same way. Next day, while they were shooting Aimee doing the pretty pussy in the box maze, she and I drove off up the Carmel hills. On the road we met Elsbury. He stopped me and said he'd had a cipher from headquarters, and that he stood ready to recommend me to General Ferrier for scout duty, but that I'd have to start east that night and sail the day I reached New York. t Iold him I'd let him know by five o'clock.

"Then we drove on through the pines, to the old Mission. We sat on the bell-tower stairs, where you can look off at the mountains and the sea, and there wasn't a living creature in sight except teh cattle, away on the hills, and a bunch of sea-gulls circling up in that blue, blazing sky. After a while, I said: 'You've got to decide this. It's up to you.'

"She turned white as chalk. Then she said, 'Go!'

"What about you?' I asked her.

"And she said, 'Never you mind about me, I'll bluff it through.'

"Take it from me, mother, she will bluff it through. The little, square, gritty thing! After that, we both forgot that I'd promised to call up Elsbury. And we wasted a lot of time. But after a while I remembered, and we scooted back to Monterey and phoned him. He was so pleased he fairly yipped. Then I hunted up the padre at St. Francis's, and corralled Len (he was best man, with his eyes bulged out on his cheeks), and at nine o'clock we were married in the little dusty chapel, and Genevieve wore Aimee Adare's yellow satin wedding-gown from the last episode of 'Hazards,' and the boss director gave her away. He snivelled all through the ceremony, for he'd counted on giving Genevieve a big part in his next super-feature, but as he said, he couldn't complain, for she'd finished doubling for Aimee, and besides, 'Any time you want to beat it back to pictures, remember, the latch-string is out,' he shouted, as our train pulled out of Monterey.

"Now, mother, you've got a line on things. By the time this letter reaches you, I'll have sailed for France. I feel like a hound-dog to think I can't hot-foot it up to Boston and say goodby. But I'll have just forty minutes from Forty-Second Street to the steamer.

"You'll be angry with me for chucking my senior year. But I couldn't wait. I've got to get into the game. No, you won't understand. Not even Genevieve understands. But she's

ROYAL YEAST CAKES

Now that the new government standard flour is in general use, the quality of the yeast you use is more important than ever. Use Royal Yeast Cakes. Their quality is absolutely reliable. Bread made with Royal Yeast will keep fresh and moist longer than that made with any other.

PIMPLES
AND
RUNNING SORES.
WOULD HOLD HEAD DOWN
FACE WAS SUCH A SIGHT.

Pimples are caused by the blood being out of order. Those festering and running sores appear on the forehead, the nose, the chin and other parts of the body.

There is only one way to get rid of this obnoxious skin trouble, and that is by giving the blood a thorough cleansing by the use of that grand old blood purifier Burdock Blood Bitters.

Mrs. Victor G. Fry, North Battleford, Sask., writes: "I used Burdock Blood Bitters when I was about 18. I was so bad with pimples and running sores, that when I went down town I would hold my head down when I saw anyone coming, my face was such a sight. I got two bottles and my face began to clear, so I kept on until I had a beautiful complexion.

I recommend it to everyone who is in a rundown condition, as it builds up the blood, and when the blood is Al the face is clear."

"So that part is settled. But for Genevieve, herself—

"Now, mother, I'm banking on you to play up. I've banked on you all my days. You've never failed me yet. You won't fail me now.

"Yes, I know what you're saying, that I'm not twenty-one, and Gevenieve is only eighteen, and you don't know her people, and we should have waited and consulted you. You'll have to forget all that. Genevieve is my wife. She's a piece of me. She's the straightest, truest—But you'll have to know her for yourself. Then you'll see.

"Now I've told her to go straight to Boston, to the Withrow Arms, and send you word. I want you to go to see her the minute you get her note. You'll know just what to say. You'll know just haw to make her feel that you're ready and eager to love her.

"Remember, mother. I'm banking on you. This time; of all times in my life, you won't fail me. You'll put this through....."

Mrs. Tuckerman folded the pages with stiff fingers. Two weeks ago today. Eight days since the halting little message had come, "Mrs. Ned Tuckerman is at the Withrow Arms and will be glad to see Mrs. Tuckerman." In those eight days she had not made one move. She had not written one word to her boy. She had not sent one sign of recognition to his wife.

Ned had gone his own way, she told herself quietly. All his life he had gone his own way. He had been a royal baby, a self-willed, domineering little mite, every inch. He was a child still, a great, splendid, overgrown cub, just as self-willed, even more reckless of authority. He was her only child, the one beloved living creature in her walled, aloof life.

This fiery rush to battle she could forgive. It accorded with her loftiest traditions. But for him to take a wife, a trivial little actress, then calmly order his mother to go to her and welcome her!

In a few days she would write to Ned. But she would not write one word of the woman he had married. She would ignore the girl's existence.

She would always ignore her existence. Even when Ned should return from France. Ned had a fortune in his own right. He loved the West. The two would make their home there. Whenever he wished his mothers companionship, he could come to her. But he must come alone. And if the wife cried out and rebelled, why then—her lips bent in a queer ugly line—"Whenever you're ready to beat it back to pictures—"

"If you please, Mrs. Tuckerman."

A maid entered, bringing a card. Mrs. Tuckerman looked at it, puzzled. Then a harsh red burned in her cheek.

"Mrs. Edward Carew Tuckerman."

So, since she had not gone to Ned's wife, Ned's wife had come to her. She was thrusting herself in, demanding her place, her courtesies. Very well. She should see.

"Bring her up at once, Mary."

She stood up, a commanding figure in her stately black, and turned to face the slight, reluctant figure at the door. Her grim mouth twitched. Wine-red velvet and white fox furs, hair like brunished metal, a small face flushed to the temples. Quite what one would expect.

"Mrs. Tuckerman?" The girl put out her hand. It was a very small hand, ice-cold through the glove. The elder woman touched it mechanically. She did not speak. Her silence was like a blow.

The girl winced, swallowed hard, then pulled herself together. She looked up steadily into the hard, older eyes. She spoke in an even, quiet voice, as if she repeated a speech already planned. "Mrs. Tuckerman, you've had Ned's letter. I have not come to ask you to do—what Ned wants you to do. But I have come to ask one thing. I'm mighty certain that you will do this thing for me."

COWAN'S
ACTIVE SERVICE
CHOCOLATE

Little Miss MAIDEN CANADA

For our Heroes——

At times during heavy bombardment the army commissariat becomes so disorganized that ordinary food is unprocurable for days.

During such times as this the value of a convenient and concentrated food that may be carried and handled easily, cannot be over-estimated.

Active Service Chocolate answers all the requirements of such a food. It is the most nourishing and wholesome chocolate manufactured. If you are unable to obtain this chocolate in your locality, write us, we will see that you get it.

Sold in 5c. and 25c. sizes.

B64

Canada Food Board, License No. 11-608.

"Yes?" Mrs. Tuckerman's voice agree." flicked. The girl winced again.

"Yes. Mighty certain." She drew back, still looking into Mrs. Tuckerman's face with dark, unwavering eyes. They were very beautiful eyes. The small, clear-cut face was beautiful, too, with its soft, child cheeks, its young, grave, urging lips.

"Before you make this request, why not tell me something of yourself? That may make it easier for me to agree."

The girl was new to irony. She twisted her small hands; her brown eyes pondered. "But I don't matter. It's something for Ned. Not for me."

"Even so, I should like to hear about your home, your people. That will help me to decide."

The girl considered. "I reckon you're right, Mrs. Tuckerman," she said at last. She slipped back her sumptuous coat and sat down, hands folded, her

FLAVOR-FULL

KING COLE ORANGE PEKOE

Undoubtedly there are *degrees* of flavor. Take Fruit for instance—you select an orange, and on eating it you find it to be flavory, certainly, but sharp—acid; choose another, a riper more matured fruit, and it is lucious, the flavor is mellowed and rounded—it is FLAVOR-FULL. Nature made a better job of the second orange. Exactly the same is true of Teas. Nature is not equally kind to all. It requires expert knowledge and continual care to select and combine FLAVOR-FULL Teas to produce the delicious cup obtained from *KING COLE Orange Pekoe.* If you love your cup of Tea, unusual pleasure awaits you in KING COLE Orange Pekoe.

Ask your Grocer for it by the full name—

King Cole Orange Pekoe
The Extra in Choice Tea

Sold in Sealed Packages Only.

Two or More Persons May Use the One Account

The "joint account" is a very popular feature of The Bank of Nova Scotia service. Each person may deposit or withdraw independently. Interest quickly accrues, and with two saving, the growth of the account is more rapid and pleasing.

Husband and wife—brother and sister—father and son, or others, are enabled to save systematically by this means.

eyes intent. "I know you're right. Because—I'm gonig to ask you to help me bluff something through. And all my life I've had to bluff. Right and left. The whole way."

"Bluff?" Mrs. Tuckerman's brows lifted.

The girl spoke steadily on. "Yes, bluff. Ned calls me one of our best little bluffers, but even Ned doesn't know how well the name fits. You see, there were three of us, mamma and papa and me. We lived in Peoria, Illinois, and papa—well, poor papa, he was the very best ever, but seemed like he never could hold down a job. He was so popular, and he loved a gay time, and he was dead sure that some day he'd make a killing out at Sportsmen's Part. So—so mamma, she sewed at the overall factory. We went to church and Sunday-school, and we held up our heads high as anybody. But we did it all on bluff. We had to. Mamma couldn't earn more than eight dollars a week, the best she could do. And poor papa—somehow he always did put his money on the wrong ponies. But mamma'd never whimper. She'd press his suit for him, and clean his tie in gasoline, and tell him she knew he'd land a job soon. 'For they can't keep a smart man down forever, Jimmy,' she'd say. And she'd dress herself up fresh and sweet, and she kept our house neat's a pin, though she had to get up at five to sweep and clean. 'An elegant home like ours takes work to keep going,' she'd say. And when we didn't have anything but mush and milk, she'd call it turkey with stuffing, or else play the mush was peach cobbler, and the milk, ice-cream. She'd even—"

The girl halted. Her slender fingers clenched. "She'd even bluff about—papa. After awhile he got grouchy, and he wouldn't clean up, and he wouldn't even try for a job any more. 'Poor Jimmy, he needs a change,' she'd say, and she'd leave him have car-fare to go to the Park. Though she'd have to walk to the factory both ways. Then she'd say she wanted to walk, 'It's good for my complexion.'" The girl stared away, down the hilly street. It was as if she stared away across the miles, the years; as if she saw again the patient wife, sending her fretful man for his day outdoors, then hurrying out on the long, hot walk to the factory.

"Well! When I was twelve, everything stopped. Papa, he got struck by an auto one night, and he died next morning. Mamma tried her best to keep on, but she went out with pneumonia two months after. She—she knew. She tried hard to tell me things, but all she could say was: 'Make the best of your life, daughter. Pretend for other folks' sake, lovey, even if you can't pretend for your own.'

"Mamma's kin had always been mad because she married papa, but they stopped being mad then. Gramma came from Iowa and took me back to the farm, and she and grampa—maybe they weren't good to me!" Her soft cheeks crimsoned, her deep eyes shone. "Music lessons, and elocution, and a party every birthday! But grampa and gramma both died when I was fifteen. They left me the farm, but it was mortgaged clear to the eaves. When everything was settled, I had four hundred dollars left. I spent a hundred for a grand monument out to the cemetery, and some more learning typewriting and shorthand. Then I went to California and got a job, first in a grocery, then as stenographer out at Sidereal City.

One day, when I'd worked there a year, a director came tearing in. 'I want an extra girl quick,' he hollers, 'to double Phyllis Harcourt on that falling-bridge stunt.'

"'Not an extra on the lot,' says my boss. "Take Genevieve.'

"I began to fluster, for I was scared to death of the risks they made the doubles take. But the boss wouldn't listen. 'Get along to the location,' he says. 'If you make good, it's an extra five-spot in your envelop. If you can't make good, mind you bluff it through.'

"Well, I went. The script called for me to stand on a log bridge over a gulch sixty feet deep, and fall with the bridge. Yes, it was faked, of course. Not all faked, though. The bridge was just two logs and a hand-rail, swung over the gulch by two ropes. The director gave the ends of those ropes to a couple of huskies, then posted 'em on the ledge twenty feet above.

"'Now,' says he, 'you stand on the bridge while they swing it back and forth, and register terror.'

"I registered terror, all right. The soul was scared out of me. But just as the logs buckled under me, the director grabbed me off the bridge, threw a dummp on it, and yelled, 'Let go!' The men let go. Down went the bridge, dummy and all, and smashed to bits on the rocks below.

"'We nailed that thrill, all right,' says the director, and he sat down and fanned himeslf with his hat. 'You're neither Pickford nor Petrova, kid, but you're sure game. Keep on putting up bluffs like that, and you'll make good every time.'

"Well, I have kept on. I've bluffed every stunt through, so far. And I've learned to bluff other things, besides my job."

She stopped, her eyes on Mrs. Tuckerman's face. Silent, Mrs. Tuckerman looked back at her. Her own face was inscrutable, a dim mask.

"Well—" the girl spoke, at last. "That brings me right up to what I want to ask. All my life I've bluffed, Mrs. Tuckerman. Now I have come to beg you to—to—" She caught her breath. Burning scarlet leaped to her temples and reddened even her white throat. "To ask you—" Again she halted. It was as if she stumbled, baffled and groping, in the other woman's daunting silence. "To ask you to help me bluff—to Ned."

"Help you to bluff—to Ned?"

"Yes." She stood up, erect, quivering. "Listen. Ned's letter asks too much. I don't ask you to like me. Nor to do things for me, either. But while Ned is away from us, while he's in danger, can't you—can't we both bluff it out to him?"

"Really—"

"Oh, you know, you know what I mean!" She took a step forward; it was as if she took her courage in both hands. "You know how much you count, to Ned. You know how he banks on you. He thinks you're the wisest woman, the grandest woman, that ever stepped. Of course he loves me. But you came first. You'll always have it in your hands to shame him or to make him proud as a king. You can always choose whether to hurt him or to make him just as happy!" Her voice broke on the tenderest cadence of love; but deep eyes flamed. "He's my husband. But he's your little boy. He thinks the world of us both, and it'll break him all up if we aren't friends. So, just while he's doing his bit, can't we bluff it through?"

"You mean?"

"Pretend that we like each others." Her voice grew tense, her eyes besought. "Only while he's away from us and in danger. It won't be on the level, I know that. But when somebody you love is fighting through misery, and torment, and pain, you just naturally can't stop with being on the level. You've got to heap it up. You've got to bluff your best, so's to make things up to them."

Silence.

"Just one letter from you will turn the trick," the quivering voice urged on. "Tell him you've seen me, and you aren't really angry—with him. I'll write to him, too, and spread it on

thick. He'll eat it up, he'll be so eager—and so glad."

Silence.

"Because—" She dropped now, a child worn out with pleading. Sobs caught in her throat. "Because it'll brace him such a lot. It'll help keep the life in him. That I know. Then, the minute he comes back safe and sound, you can snub me as much as you please." Her voice hardened. Defiance flashed in her brimming eyes. "But till then, let's bluff it out together. If he never does come back—"

Mrs. Tuckerman put her hand to her throat. An icy shadow seemed to fall between the two.

"Even then, I'll be glad we deceived him. For he'll go out thinking I've made good with you. And believing you were willing to be friends—with me."

Silence.

"Well." She turned and picked up her cloak. Her hands shook, her whole slight body shook. Defeat had beaten her down like hail. "Well, if you can't see it my way—but if you only could! Take it from me, it never pays to hurt somebody you love. No matter how bad they've hurt you. But if you just could try! If you'd only help me bluff it through—"

Her voice dropped for sheer weakness. White, wan, quivering, she stood before Mrs. Tuckerman a long minute, then bent her head and turned away. Then, at last, Mrs. Tuckerman spoke. "Perhaps your plan is not so difficult." Her hard voice wavered. Her strong mouth trembled on the words. With a supreme effort she pulled herself to her feet and wnt slowly toward the girl. Through the gray mist that hung between she saw her son's wife only as a flaring iridescence of wine and gold and small white startled face. "It might be—feasible."

The girl stared back at her. "You mean—you mean—"

Mrs. Tuckerman brushed her hand against that gray mist. Could she have seen the unbelieving hope on that small face, it might have blinded her still more. "I mean what I say. Don't you think it's the best I can do—to help you pretend?"

Her voice was curt and harsh. She was pitiful, she was almost ridiculous, in her grim, white-lipped majesty. But the girl, with oen amazed, half-whispered cry, flashed to her, straight as

"You will do it! You will! For Ned!"

"Yes. For Ned. But not just for Ned, either." Mrs. Tuckerman thrust straight on. For the brave surrender of the Puritan was upon her. Stiff-necked, unrelenting, cruel, yet just to the core of her soul, she could yield and yield gloriously, for she knew herself conquered by a nobled foe. "For—for—" Her arms were around the girl now, her lips were warm on the soft, frightened face. "Oh, my dear, do you think we'll have to pretend for Ned? Can't it be love between us, and not pretending at all?"

"Well!" At last the girl freed herself, and looked up. Her face was blurred with tears, but her eyes were stars. "Well! Just answer me this one question: is it any wonder Ned felt so sure? So sure he could bank—on you?"

Evidence Crops Up Every Day

That Dodd's Kidney Pills Always Help Kidney Disease

Quebec Man Who Suffered From a Rundown System and Kidney Disease Finds Quick Relief.

Misguasha Point, Que., Oct. 5th.—(Special).—More evidence crops up in this vicinity every day to prove that for rundown people there iis no remedy to equal Dodd's Kidney Pills. Among the many who have come forward with statements is Mr. Paul Landry, a well-known resident, whose testimony can easily be corroborated.

"It is with great pleasure that I write to tell you your Dodd's Kidney Pills are the best medicine that I have ever taken," Mr. Landry states. "When I commenced to take them there was not much hops for me. After taking four boxes I felt like myself again. I advise all persons who suffer from kidney disease to take Dodd's Kidney Pills."

Dodd's Kidney Pills are popular all over this country, because they not onl ycure the pains and aches of the different diseases springing from disordered kidneys, but also give new life and energy all over the body. They do this naturally. They cure the kidneys. Cured kidneys train all the impurities out of the blood, and the pure blood carries nutriment instead of poison to all nerves and muscles. You have never heard of a person Dodd's Kidney Pills harmed. You hear of thousands who have benefited by them.

GREEN TOMATO SWEET PICKLE

To each seven pounds of tomatoes use about one-half dozen medium-sized onions, silced, three pounds of sugar, one pint of strong vinegar, and one pint of water, an ounce of cinnamon, and one-half ounce each of cloves and allspice—or, better, two ounces of mixed spices. Cover the tomatoes with a brine, using about one cupful of salt to a gallon of water. In the morning drain off well. Place the vinegar, sugar, spices (tied in a muslin bag), and the tomatoes in a preserving kettle and simmer slowly until tender. Put into jars and seal. If mixed spices are not used add a teaspoonful of whole pepper.

PLOWING THE GARDEN

Early plowing is necessary for an early garden. Land plowed in the fall will dry quicker and be ready to plant sooner than spring-plowed lano. The fall-plowed garden should be left in the furrow slice unworked, because this rough surface will catch the winter rain and let the water soak into the sub-soil below; more soil moisture is stored; more of the surface soil finds its way into the openings in the subsoil, thus loosening and ameliorating the latter. The higher masses oi surface soil granulate under the influence of alternate freezing and thawing and sun and rain. If a garden is forked or spaded no attempt should be made to level it.

If sub-soilnig is desirable it should be done in the fall. Usually at this season the subsoil is not wet, and therefore will not be puddled by handling. Winter freezing mellows and disintegrates the subsoil. Leaves oi similar loosening material to be worked into the soil are more plentiful in autumn. This fall working also gives the soil time to settle before spring planting. Soil worked deep in the spring, leaving an opening below, may dry out badly, especially if much coarse organic matter is worked in shortly before planting.

During the first sunny days of early spring the rough surface of fall-turned land dries and flocculates. It is in condition to work down and be planted early. On the other hand, land which lies unturned ,smooth and flat during a wet winter has no dry flocculent surface, and remains too wet to handle util late.—Dr. J. C. Whitten, Missouri.

The Name *Ingersoll* on the Dial

Guarantees you a watch that has given a better time-keeping service to the people of the world than any other watch, at any price.

INGERSOLL RADIOLITE $3.00

Before the invention of the Ingersoll, a quarter of a century ago, watches were luxuries, now fifty million men, women and children—seven times the population of the Dominion—have learned to be punctual and systematic by using an Ingersoll watch.

From coast to coast, from pole to pole, all around the world you will find Ingersolls ticking off the hours for work and play, night and day.

Made in Canada and sold by all good dealers at prices to suit every pocketbook—low cost—fine appearance—sturdy workmanship—correct time-keeping. These are the qualities built into every Ingersoll watch and guaranteed by the makers.

WATERBURY RADIOLITE $5.50

BREAKING FIVE-TON BOULDERS

A good many farmers have trouble in breaking boulders with dynamite, because they don't know how. Perhaps this will give some of you readers a few practical ideas on the subject. James Waters of this county had several of these five-ton rocks on his place and asked me to smash them up for him.

With a 2-inch soil auger, I bored a hole in the ground under them, going about to the center of each. It is important to get the charge of dynamite right up against the stone. I loaded one pound of the explosive in each hole. This threw the boulder out of its bed onto the surface of the ground. Sometimes the preliminary shot will break or crack the rock.

I then placed 1½ pounds of dynamite on top of the stone, covering the charge with about 6 inches of thick mud. This mudcap charge, as it is called, shattered the stones in pieces small enough to be easily handled by a man and carried away. Sixty per cent straight dynamite is better for mudcapping boulders than the 40% ammonia and less of it would be required to do the work.

The mistake made by many men is in trying to break the boulder by mudcapping white it is still imbedded in the ground. It is almost impossible to break a stone under such conditions. The earth seems to hold it together. Even when the dynamite is loaded in drill holes in the stone, it takes a larger charge to break it when earth is packed around it.—T. A. C.

EIGHT WAYS TO BEAT THE RAT

1. Make all new buildings and other structures rat proof.
2. Make old buildings rat proof by remodelling.
3. Construct and screen sewers and drains so that they will not provide entrance and retreats for rats.
4. Insist on greater cleanliness about markets, stores and generally throughout cities, villages and country districts.
5. Thresh and market grain early, so that stacks will not furnish harboring places and food for rats.
6. Remove piles of straw, trash and lumber which harbor rate in fields and vacant lots.
7. Protect the hawks, owls and other natural enemies of rats, which are not so destructive to poultry as rats themselves.
8. Keep well-trained rat dogs on farms and about city warehouses.

HALF THE ILLS OF LIFE

ARE CAUSED BY

CONSTIPATION.

When the bowels become constipated, the stomach gets out of order, the liver does not work properly, and then follows the violent sick headaches, sourness of the stomach, belching of wind, heartburn, water brash, biliousness, etc.

Keep your bowels regular by using Milburn's Laxa-Liver Pills. They will clear away all the effete and poisonous matter which has collected in the system, give you a free, easy and natural motion of the bowels every day, start the sluggish liver working, and give tone and vitality to the whole intestinal tract.

Mrs. Jos. Labrec, Louise Apts., Calgary, Alta., writes: "I have been troubled with constipation for the last two years. I have tried numerous treatments, but have never been relieved by anything until I used Milburn's Laxa-Liver Pills, which are helping me wonderfully."

Milburn's Laxa-Liver Pills are 25c. a vial. For sale by all druggists and dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

WHATEVER YOUR SKIN YOU CAN IMPROVE IT

In these days of melical enlightenment, beauty is no longer a matter of being "just naturally born lovely." Since way back before the time of Cleopatra, women have been seeking to achieve beauty, but now, more than ever before, they have the weapons of achievement—knowledge of the workings of the human body.

It is on this knowledge that reliable beauty experts base their instructions to us, and we follow them with respect accordingly.

We must realize that to look our best is a duty, and a duty which can be accomplished only by regular attention. An ugly skin is a confession of sloveliness just as surely as a dusty hat or run-down heels.

Some people are born with good skin; a few manage to retaini it in spite of every indiscretion that human folly can commit; but whatever complexion most women possess, especially after their first youth, they have to achieve and conserve.

After a woman is forty, the skin, losing its natural oil, tends to become dry and rough, the muscles become less elastic, causing a sagging and drooping of the lines of the face, and the ordinary wear and tear— the laughter and frowns—of twoscore years begin to show in crow's-feet, double chins and wrinkles great and small; this, every woman knows.

What she would like to know is the remedy. There is a remedy for most of these ills of the flesh if you are willing to be faithful and persistent. Your skin can be made finer in texture, its color can be improved, and the wrinkles even can be eradicated—in time. But attention to the skin must be regular. Spasmodic treatment will yield nothing but disappointment.

First look to the general health. Unless a supply of good, rich blood flows freely beneath the skin, external treatments do no good. The circulation must be properly nourished. Therefore eat nourishing food, avoiding religiously what does not agree with you.

Exercise, out of doors if possible; if not, before an open window night and morning. Drink plenty of water—at least eight glasses a day. Get sufficient sleep—most people need eight hours—in a room with the windows open.

When your general health is as good as you can make it, you can look more definitely to the skin. In some cases it needs little more than to be kept clean, a matter about which many people are not so careful as they think they are. Select a good soap; that is, one that does not contain free alkali. This is especially important if your skin is inclined to dryness. In that case, too, it is well to boil the water to free it from the lime, which withers the skin. Rain-water is even better. Or oatmeal used in a bag is helpful in overcoming dryness.

In washing the face, many people seem to think that vigor is the one thing needful. They rub and scrub with a rough cloth and finish with a harsh toweling, thereby deepening every wrinkle. The dirt is on the surface and can be removed by gentle movements. Wash your face at night with blood-warm water and soap. Apply cold-cream, rubbing it well into the skin, always with an upward and outward movement; then wipe it with a soft cloth (dipped in witch-hazel if the skin is too oily) and apply the cream again.

Ice is excellent for toning up loose, flabpy skin, making it firm. I have heard it opjected that ice used in this way sometimes causes neuralgia, but authorities say that if it is applied over the cream, it will not have any ill effects. Cold water, too, may be dashed over the face after the cream has been rubbed in. The face must then be wiped a second time. The cream should not be left on overnight, as it prevents the throwing off of waste matter.

Where the skin is loose and flabby, even if it is dry, an astringent should be used. Cold water, especially if a little salt is added, acts as an astringent. Lemon juice is thought to be too strong for most skins. There are, too, many good astringents on the market.

After the skin is thoroughly cleansed, it should be massaged. There is nothing in the treatment of the skin more important than this matter of massage. Dry skin especially, having lost its natural elasticity, needs massage, for massage induces a normal flow of oil, besides promoting circulation and building up the muscles. It must be done carefully, however, in order to do any good.

If the fee of a professional masseuse is not prohibitive, you will feel repaid for the outlay. Nevertheless, one can do it oneself if sufficient care is taken. Above all, massage should be done regularly. Ten minutes every night will give more satisfaction than sixty when a reform wave overtakes you.

After the face has been washed and wiped off with care the cream, and an astringent and second coat of cream applied, begin the massage. The strokes should always be easy and gentle and the movement always upward and outward, as a downward motion will increase the discouraging tendency of the muscles to sag.

To massage begin at the corners of the mouth, working upward with a kind of clawing motion executed with

CURED HIS RUPTURE

I was badly ruptured while lifting a trunk several years ago. Doctors said my only hope of cure was an operation. Trusses did me no good. Finally I got hold of something that quickly and completely cured me. Years have passed and the rupture has never returned, although I am doing hard work as a carpenter. There was no operation, no lost time, no trouble. I have nothing to sell, but will give full information about how you may find a complete cure without operation, if you write to me, Eugene M. Pullen, Carpenter, 5543 Marcellus Avenue, Manasquan, N. J. Better cut out this notice and show it to any others who are ruptured—you may save a life or at least stop the misery of rupture and the worry and danger of an operation.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters. I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days' trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309 - - Windsor, Ontario

Too Nervous To Sleep

Nerves Wrecked by Accident—Was Afraid to Go in a Crowd or to Stay Alone—Tells Of His Cure

Much sympathy was felt in this city for Mr. Dorsey, who met with a distressing accident when his foot was smashed in an elevator.

The shock to the nervous system was so great that Mr. Dorsey was in a pitiable condition for a long time. He was like a child in that he required his mother's care nearly all the time. He feared a crowd, could not stay alone and could not sleep because of the weakened and excited condition of his nerves.

Detroit doctors did what they could for him, but he could not get back his strength and vigor until he fortunately heard of Dr. Chase's Nerve Food.

It is no mere accident that Dr. Chase's Nerve Food proves to be exactly what is needed in so many cases of exhausted nerves. It is composed of the ingredients which nature requires to form new blood and create new nerve force. For this reason it cannot fail and for this reason it succeeds when ordinary medicines fail.

Mr. Laurence E. Dorsey, 39 Stanley street, London, Ont., writes: "About three years ago I got my foot smashed in an elevator in Detroit, which completely wrecked my nerves. I doctored with the doctors there, but they did not seem to be able to help me. My nerves were in such a state that I could not go down town alone or go any place where there was a crowd. Sometimes my mother would have to sit and watch over me at night, and sometimes I could not get any sleep at all. But one day last winter I commenced using Dr. Chase's Nerve Food, and before I had completely used the first box I could see a difference in my condition. I continued using these pills for some time. The result was splendid. I feel so much better, can sleep well at night, can go out on the street and attend gatherings like the rest of people. I am so pleased to be able to tell you what Dr. Chase's Nerve Food has done for me, and to recommend it to other people."

Dr. Chase's Nerve Food, 50 cents a box, a full treatment of 6 boxes for $2.75, at all dealers or Edmanson, Bates & Co., Limited, Toronto. Do not be talked into accepting a substitute. Imitations only disappoint.

the fleshy part of the finger-tips; work over thecheek bones up to the temples.

The cheeks may be massaged also with a rotary motion outward. In all rotary motions remember that the upward part of the stroke should be harder than the downward. Use the rotary motion also on the temples and the forehead. If, however, the forehead is lined, smooth it out instead of using the circular movement.

In smoothing out all wrinkles, the movement should be in the direction of the wrinkle, for the tissues in the creases have been broken down and are in great need of the increased flow of blood and of the nourishment furnished by the massage and the cream. If you make a movement across a wrinkle, make one in teh oposite direction with the other hand. Lines across the forehead may sometimes be helped by loosening up the scalp about the hair line by a little gentle massage.

An oval movement with one finger is used between the eyes. Or the wrinkle may be held firmly apart with the two fingers of the left hand while with the right forefinger one works at the crease and irons out the furrow.

The position of the hands in removing crow's-feet is as follows: The right forfinger traces out a figure eight at the corner of each eye. It is especially important in banishing this unbecoming sign of mirh and laughter that the skin be kept well nourished.

In reducing double chin, both hands are used. Begin at the point of the chin, holding the chin in the hands as in a cup. Rub hard, in and down toward the throat, first with one hand then wih the other; or, beginning at the point of the chin, rub firmly out toward either ear.

The throat and neck, too, should be massaged. The movement here is circular. Using the thumb, placed under the jaw, as a brace, execute the rotary movement on the other side of the neck, with all the fingers. As you work, gently pinch the flesh a little.

If the throat and neck are too thin, the movements should be gentle; if too fat, the strokes should be vigorous. Continue the massage until a slight, pleasant glow or warmth is felt. From six to ten minutes will usually effect this.

The remedies are simple, but to give results they must be applied regularly. It is the chief thing in the care of the skin, and one can not begin too soon.

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Address

Mrs. M. Summers
BOX 309 WINDSOR, Ontario

WINTER GARDEN IN THE CELLAR

If you have a warm cellar you can grow fresh vegetables all winter. It is particularly easy to grow rhubarb in the cellar and to provide enough for pies at any season when they will be greatly appreciated. Asparagus is forced almost as easily, while dandelions, endie vand horse radish may be grown without much trouble.

Perhaps it is best to experiment with rhubarb if one feels a little doubtful about the success of a cellar garden. Rhubarb roots are plentiful and cheap, but it is well to use only those which are at least three years old. Usually they can be obatined in the home garden or in the garden of a neighbor, but if not, a seesdan or nurseryman will provide several clumpsat small expense.

Freeze Rhubarb Roots

When the roots come from the garden they must be dug before the ground freezes, although they are not to be forced until they have been well frozen. It is difficult to dig them after the ground has become frozen, of course, but they should be left on top of the ground until the frost has penetrated them. Then they will keep safely until the time to start them into growth arrives. As a rule they do not force well until after January 1.

The plants may be set on the cellar bottom or in boxes and commonly are simply covered with two inches of sand, the latter being kept moist at all times. Quicker results are secured if a layer of fresh horse manure is placed under the clumps and covered with two or three inches of loam, so that the roots will not be burned. A foot apart is the right distance to set the clumps.

Rhubarb forced in this way is best grown in the dark, for which reason it is well to hang a curtain over the window or across a corner of the cellar, or to partition off one end. Of course, only a little room is needed. Two or three months will be required to produce acrop and the stalks will be almost white, with but little leaf growth and of delicious flavor.

Don't Allow the Roots to Freeze

Similar methods are to be followed when asparagus is forced in the cellar, except that the roots must not be allowed to freeze. They may be kept in a cool place, however, and a few forced at a time. Plants from the garden or the fields of professional growers may be used if they are at least three years old. Seedsmen sell plants designed especially for forcing.

The roots are to be grown in the dark, like those of rhubarb, and should be set close together, but not crowded, with ordinary soil worked around them so that all the spaces are filled. Asparagus comes along rather quickly, and often may be eaten in six or seven weeks from the time forcing begins.

For all vegetables grown in the dark a temperature of from 50 to 65 degrees will be about right. In many furnace-heated cellars there will be no difficulty about the temperature, but sometimes it may be necessary to provide a little extra heat, which is easily accomplished by hanging one or two lighted lanterns in the cellar, but first the glass must be painted black, so that no light will be emitted.

There are other vegetables which may be grown in the kitchen in full sunlight during the winter months. A little bunch of parsley potted and given a sunny window will furnish flavor for many a sovory dish. Sage may also be grown in pots. Cress is easily grown in a box set in the window and a few seeds will give plants large enough to use in a few days. Chives may be forced in the same way, so that there need be no lack of fresh green stuff, even when the ground outside is piled high with snow.—E. I. Farrington.

Knit Socks and Dollars with the Auto Knitter

Profitable employment at home in war or peace time

Socks—more socks—the Soldiers' call! The hosiery industry is booming and the demand far exceeds the supply. Help us fill it but get away from slow hand knitting. Use the fast, reliable, modern Auto Knitter. We gladly take all the socks you wish to send us and pay you highly profitable prices.

The Auto Knitter is simple and easily learnt— and secures a big income for full or spare time work right in your own home and no previous experience is essential.

Write today for full particulars enclosing 3c stamp. See what good money you and your family can earn at home besides doing patriotic work.

Auto Knitter Hosiery (Can.) Co., Limited, Dept.475B 607 College St., Toronto.

If Your Hot-Water Bag is past mending do not discard it, but cut off the top, open the bag out flat and cover it with a pretty colored linen. Fold into the desired shape and use as a washcloth, toothbrush, soap and sponge holder when travelling.

"Unto the least of these"

RIVET your eyes on this picture of a Belgian mother and child, until you feel the full horror of the situation! Thousands of these orphans, dying of starvation, might now be living in comfort and plenty, had their soldier fathers not flung themselves into the breach when the Hun invaded Belgium.

The fathers died to save us. Are we going to let the orphans starve?

Conditions are simply ghastly. The United States loans to the Belgian Government finance the general relief work, but this only provides a bowl of soup and two pieces of bread to each person per day.

What is that for a growing child?

The Slaughter of the Innocents is less terrible than what is now occurring in Belgium—practically a whole generation of the Belgian nation in the grip of Consumption, Rickets and other ills all directly due to insufficient nourishment.

The Canadian Bureau in Brussels will administer funds, and provide means for getting the ailing children into Holland and into orphanages where they can be saved from a hideous death.

Before you sit down to another meal, do SOMETHING for the Belgian children. . . . . .

Make cheques payable and send contributions to

Belgian Relief Fund

CANADIAN GOVERNMENT BOOTH AT CHARLOTTETOWN

The Canadian Governments Booth at the Charlottetown Exhibition was one of the main centres of attraction in the main building. There the public saw a beautiful model of the car ferry, about 4½ feet long, complete in every artistic detail. The walls of the booth were decorated with colored pamoramic maps of the Maritime Provinces and special sections thereof, such as Prince Edward Island and The Bras D'or Lakes. An exceptionally fine picture of the Quebec bridge showed this masterpiece of structural engineering art. Booklets and post cards advertising the Canadian Government Railway system were distributed by Mr. Frank L. Doujan, the energetic and efficient Travelling Passenger Agent, who had charge of the booth. The citizens of Eastern Canada are justly proud of the Canadian Government Railway system, which gives such excellent service to the travelling public, and the section through which it operates.

Increases Value of Horse

In the olden days when a horse was strained or had any blemish, it ended his career as another horse was speedily procured in place. At the present time, owing to the high prices—horses are now bringing on the market, few can afford to dispose of a blemished horse of which there is any hope of treating and again making sound.

One of the important means of treatment has been the popular remedy Absorbine. Absorbine is a pleasant as well as a convenient remedy to use, does not blister or remove the hair and horse may be used during treatment.

Absorbine has been successfully used for more than a quarter of a century and here is what a few of its users think of it: "I have received the remedy all O. K. and used it on my horse with great success. He had fistula about ready to burst when Absorbine came. Began to use it by steaming with hot bran poultice over Absorbine and never saw anything yield to treatment so quickly. My horse is almost well. I have killed the fistula and don't want to be without Absorbine in my house."

Absorbine is sold by leading druggists at $2.50 a bottle or will be sent by the manufacturers upon receipt of price.

A booklet on "How to treat a blemished horse" may be obtained by writing

Montreal, Canada.

MARKETS.

THE HAY MARKET

Reports from all leading Maritime Province hay sections to the Maritime Farmer, are to the effect that hay has not yet been pressed and quotations on the new crop are not available. Farmers are busy with harvesting to consider hay pressing and owing to the serious weather conditions, it may be some little time before hay will be available. The Maritime Farmer is arranging for a supply direct from farm to farmer and prices will be announced as soon as they are received.

MONTREAL

Trade in Eggs Continues Brisk

The Canadian markets generally continue very firm with a steady upward tendency, although the advance in jobbing and other prices has probably not been quite as marked last week as during the week previous. Country shippers of all kinds report a brisk demand. The demand is keenest for the higher grades. Consumption both at local points and in the larger centres is reported good for the season.

Storage eggs are coming into more general use. Montreal has been gradually using more and more storage while this week for the first time Toronto reports noticeable movement of storage into consumption. The control of profit on storage is bound to have a stimulating effect on consumption. Many holders are reported to have disposed of their stock at the maximum allowed by the Food Board.

Shipments by egg circles in Ontario are considerably in excess of those at this time one year ago. Prices obtained at the week end range from forty-eight to fifty-one. In Prince Edward Island, the Egg Circles report some falling off in production with reduced receipts.

In the western provinces receipts are very light, and in Alberta particularly, the movement out of tsorage is assuming large proportions. The consumption of eggs at producing points is very heavy, due to harvesting and threshing operations. Some carlot movement continues, two cars of fresh seconds and one car of storage seconds reporting rolling at the present time. Vancouver is reported short of eggs, both storage and fresh, and dealers there have been active buyers on the prairie markets.

A very active business continues to be done in eggs for local consumption, and in consequence the tone of the market is very firm, but prices show no change. The receipts to-day were 463 cases, as against 2,921 for the same day last week, and 1,408 for the corresponding date a year ago.

We quote wholesale jobbing prices as follows:

Strictly new laid eggs.....58c to 60c
Fresh selected stock.....00c to 54c
Storage selected stock.....00c to 53c
Storage No. 1 stock.....00c to 49c

Poultry—Montreal reported, very heavy receipts last week, much of the stock showing poor or irregular quality.

Toronto receipts were also heavy, but they were better taken care of to better advantage. Considerable congestion occurred in Montreal, the larger dealers were loaded up and many of the smaller dealers had to dispose of their receipts at a loss. The situation in Montreal Monday had improved under an increased consumptive demand.

The movement into storage is increasing, particularly in Toronto. In the west, with the exception of Alberta points, the movement is very light. The lowest prices reported anywhere are from North Battleford, where chickens are available at twenty cents a pound. Receipts at Winnipeg are light and will probably continue so until after harvesting and threshing are further advanced.

The United States markets have been very unsteady following the exceptionally heavy receipts the previous week-end. The prices of chickens suffered most during the decline. Now that new price levels are being established, some dealers expect a reaction, as a result of reduced shipments and increased consumption. Dressed poultry have not been as seriously affected in price as have live.

The American navy is reported to be taking considerable dressed fowl off the market.

The following prices are being paid shippers in the country:

Hens, 5 lbs. each and over..27c to 28c
Hens, 3½ to 4 lbs.....24c to 26c
Roosters.....00c to 20c
Old turkeys.....00c to 30c
Young ducks, 4 lbs. each and over.....00c to 22c
Old ducks, fat.....00c to 20c
Broilers, 3 to 4 lbs., per pair.00c to 27c
Young geese.....18c to 20c
Milk fed chickens, 3 lbs. each and over.....00c to 30c
Chickens, 3 lbs. ea. and over 27c to 28c
Squabs.....60c to 65c
Old pigeons.....00c to 40c

There is a lot of poor thin poultry coming on the market and we must caution shippers that poultry must be plump and fat to bring the above prices. Thin or cull poultry not wanted at any price.

Potatoes—A weaker feeling has developed in the market for potatoes owing to the more liberal supplies that have come forward, and prices have declined 25c per bag, and the prospects are that they may possibly go still lower in the near future on account of the fact that dealers generally are well supplied, and also large consumers, consequently the demand was slow to-day in a wholesale jobbing way at $2.25 per bag of 90 lbs. ex store. Car lots of Green Mountains were quoted at $1.90, and Quebec white at $1.75 to $1.80 per bag of 90 lbs. ex-track.

New York, October 3.—Eggs, barely steady. Receipts, 11,583 cases. Fresh gathered, extras, 56c to 57c; fresh gathered, regular packed, extra firsts, 54c to 55c; do firsts, 52c to 53c; State, Pennsylvania and nearby western hennery, whites, fine to fancy, 68c to 73c; State, Pennsylvania and nearby hennery, browns, 58c to 60c; do gathered brown and mixed colors, 50c to 57c.

The Provision Market

Montreal, Oct. 5.

The trade in live hogs here to-day was quiet and the market was without any new feature to note. The tone of the market was steady with sales of odd small lots of selected stock at $19.50 to $20 per 100 lbs. weighed off cars. There was no change in the condition of the market for dressed hogs, prices being maintained with a steady demand in a wholesale jobbing way for abattoir fresh-killed stock and sales were made at 28.50 per 100 lbs.

The market for smoked and cured meats was without any important change to note, prices for all lines being steady with a fair demand for supplies for local consumption and a good business was done in a wholesale jobbing way with sales of 8 to 10 lb. hams at 37c per lb., 12 to 15 lbs. at 35c, and heavier weights at 34c, while breakfast bacon sold at 42c to 43c., Windsor selected bacon at 45c to 46c, and Windsor boneless bacon at 48c to 50c. The demand for barreled pork was slow and the market was dull, with car lots of American bean pork quoted at $43 per barrel, duty paid, short cut clear pork at $48, and clear fat back pork at $60.50.

The tone of the market for lard remains steady with a fair demand for supplies and a good trade was done in a wholesale jobbing way in Canadian pure leaf grades at 31½c per lb. in 20 lb. wood pails, and at 33c per lb. in 1 lb. blocks, while American compound lard sold at 27c to 27½c per lb. in 20 lb. wood pails.

The receipts of provisions to-day were 6 barrels porks, 73 packages lard, and 336 packages tinned meats.

Chicago, Oct. 3.—Provisions weakened owing chiefly to a setback in the value of hogs. On the declines, though, packers bought lard and ribs, presumably against shipping sales. Prices closed varying from $1 decline to 75c advance. Future quotations were:

Mess pork, per bbl.:—

	Open.	High.	Low.	Close.
Oct.	....	....	....	$36.30
Nov.	$38.00	....	....	36.80

Lard, per 100 lbs.:—

Oct.	....	$26.80	$26.60	26.65
Nov.	$25.50	25.80	25.50	25.70

Short ribs, per 100 lbs.:—

Oct.	....	22.65	22.17	22.65
Nov.	22.67	22.70	22.27	22.60

Cash prices closed: Pork, nominal. Lard, $26.95. Ribs, $22.50 to $23.25.

Millfeed and Rolled Oats

Montreal, Oct. 5—There were no further developments in the market for millfeed, prices being unchanged with a continued good demand from all sources for supplies, and an active business was done with sales of pure grain moullie at $68, feed cornmeal at $66, barley feed at $62 to $63, and mixed moullie at $55 per ton, including bags, delivered to the trade. Car lots of bran sold at $37.25, and shorts at $42.25 per ton, including bags, ex-track, and bran at $39.25, and shorts at $44.25 per ton, ex-warehouse, including cartage, less 25c per ton for spot cash. The condition of the market for rolled oats was steady with a fair trade passing and sales of broken lots of standard grades were made at $5.20 to $5.30 per bag of 90 lbs., Golden oatmeal at $5.75 to $5.90, and bolted at $4.25 to $4.50 per bag, delivered to the trade.

The Baled Hay Market

Montreal, Oct. 5—There was quite a little excitement in the market for baled hay today, when it was announced that the Government had offered to pay a bonus of $5 per ton for all the hay that dealers could possibly deliver to them for the next two weeks, and we now quote car lots of No. 1 hay at $25 to $26, No. 1 light clover mixed hay at $25 to $26, No. 2 Timothy at $24 to $25, No. 1 clover mixed at $23 to $24, and No. 3 timothy at $22 to $23 per ton ex-track here.

Butter Prices

Montreal, Oct. 5—We quote wholesale prices as follows:

Finest creamery.....49c to 50c
Fine creamery.....48c to 48½c
Finest dairy.....41c to 43c
Fine dairy.....39c to 40c

The following prices are being paid by the Commission for butter:

No. 1 creamery, per lb.....46½c
No. 2 creamery, per lb.....46c
No. 3 creamery, per lb.....45c

The Maritime Farmer Women's Institute Official Organ

At the recent convention of the Women's Institute held at Fredericton, "The Maritime Farmer" was selected as the official organ of the Womens Institutes of New Brunswick. "The Maritime Farmer" would be glad at any time to hear from any of the Womens Institute branches as to their progress. We would like to have items of general interest, believing that each branch can thus offer suggestions to other sections of the organization. "The Maritime Farmer" will place a section of the paper at the disposal of the members of the Womens Institutes.

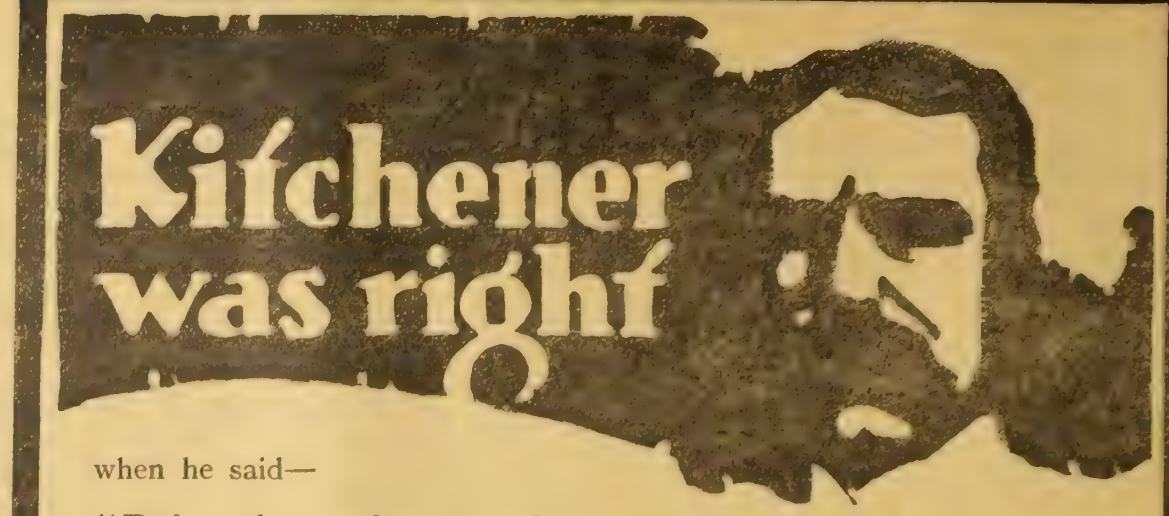
CO-OPERATION GROWS APACE IN MARITIME PROVINCES

(Continued on page 28)

lots of it, so they became not only willing but anxious to cultivate the business offerings of a united body of farmers.

And so it is with feeds and flour. Some day these commodities will be offered on the market as freely as before the war. Then, if the farmers will organize, they will find the millers of this country ready to look for their business, just as the fertilizer manufacturers are seeking to make sales for their lines. Every effort is being made to discourage this course. It has been represented to farmers that they should pay the long price, when a short price can be secured. Money has been refused by some banks, but the live-wire banks of the country are awake to the desirability of giving credit to careful farmers. And they are doing it, too. In other places feed prices have been cut temporarily to discourage co-operation, which if killed would result in a return to the old prices. It was the untiring fight of the Maritime Farmer which resulted in the prohibition of the export of mill feeds. It was the Maritime Farmer that brought about the licensing of feed dealers and the restriction of profits. But these advantages if won, can only be held by co-operation. The thing is to organize.

Much business can be done by farm organizations in a wholesale way. The car is your warehouse. Under the new regulations governing the agricultural societies of this province, societies may borrow money from chartered banks to buy fertilizers, feeds, flour, etc. They have extensive powers covering all their needs. So why not co-operate with your neighbor and save him and yourself money? Write the Maritime Farmer and we will send you further information.



when he said—

"Either the civilian population must go short of many things to which it is accustomed in times of peace or our armies must go short of munitions and other things indispensable to them."

NOW, the only way we can possibly live up to that obligation is by going without in order that our soldiers may have. For the money we waste is not money at all—it is equipment, clothing, shot and shell that are urgently needed in France.

By denying ourselves, therefore, we enable Canada to procure to the fullest extent the materials and labor which she and our Allies need for the successful prosecution of the war.

What happens when we fail to save?

A pull on labor by the Government in one direction and a pull on labor by the people in the opposite direction. Hundreds of millions of dollars are of no use to the country if goods and services can be secured only to the extent of eighty millions of dollars. So we must do everything in our power to release both goods and labor for the purposes for which Canada needs them.

WHETHER it be food, coal, wool, steel, leather, labor or transportation, the result in all cases is the same. Whoever competes with the nation by freely satisfying his own desires, selfishly appropriates to his own use that which is so urgently required for our fighting men in France.

For the sake of your country and the boys "over there," spend cautiously. Think of what Lord Kitchener has said, and ask yourself first, "Is this something I really need or can I do without it?"

IN ROAD-MAKING FOUNDATION IS PRIME REQUISITE

The first road building of any importance that we have any knowledge of is in the history of the ancient Romans. Strange as it seems, too, that the first should be the most perfect, these old highways were of the most lasting construction that has ever been practised on any road of later date. The most celebrated of these ancient Roman roads is the Appian Way, begun 312 B. C. and completed 30 B. C. Portions of this splendid work are still used, and the whole 350 miles of its length was in excellent repair 500 years after completion. This is amazing when we recall how some of our modernly constructed pikes are out of repair in two years from date of the fulfilment o fthe contract. Should we not turn again to the lessons taught us by the ancients? The Roman roads were no doubt very costly to build, but when you count the years of service from them, that first cost dwindles into insignificance. But if these road builders, who were far ahead of their time, could build roads in France, England, Palestine and their own country, surely we can experiment on a few of our own that would necessarily have an outlay of a heavy first cost.

The foundation of a road is the prime requisite in its whole course of construction. If the surface of the road has no firm bed to rest on it will go to ruts and ruin in a short time. Water, the worst enemy of all roads, will enter and weaken the alreaddy faulty work and the freezing may reach the bed and contribute its bit toward destruction. The weight of wheels is felt to the extreme depth of the bed and causes wear on that part of the road where it should be only on the surface. The old time roads had foundations such as we use under many of our large buildings. The four layers of material used in the construction were sometimes 3 and 4 feet thick and each in turn laid in mortar or cement. They went down until they found a firm subsoil upon which to lay the foundation.

After a satisfactory foundation has been made, the builders ought not to be elated with their work until they have seen well to the perfecting of the drainage system. All roads built now have side ditches cut at various depths. Sometimes they drain the road to the required depth and sometimes—yes, too often—they drain only a few inches below the surface. If the ditches can not be cut deep enough at difficult places, such as in cuts through hills, underdrains could be laid parallel under same and this would carry away all surplus water and drain the foundation and also the subsoil. The subsoil must be dry if the road is to stand wear as it is intended. Subsoil draining is a troublesome task at best and there must be other factors brought to bear on the feat if it is to be successfully accomplished. If the foundation has been laid on firm ground and consolidated with the steam or horse roller and firmly set, and the next course laid and consolidated with the aid of water and some fine material, it will be almost impervious to water from the top. Then the subsoil can be drained with the side ditches and the underdrains. But if the coarse material is laid on a layer of mud or boggy ground all the work above will avail little and the water will come through from the top and the subsoil, which is usually of a nature to retain water, cannot possibly be drained perfectly by any method known.

A little more permanency, I think, will be most acceptable in our plan of road making. The strip of road that is from two to three miles long, when built require an outlay of money of such proportions that if the same amount would be expended in many

other undertakings would be an unquestioned inducement for stability.

If this is not done in the building of the road, it seems rather unfair to place blame on the contractor who is in the business for the money and wants to do th ework so as to just come inside the money. We probably would be much like him under the same test. Verily, this work could be done much more satisfactorily if every dollar spent on the contract would be placed for construction or material and not a large per cent. of it deducted for profit. I can't conceive of a plan how this might be done, but when the cause is urgent enough there will be a way. The Government is controlling our food and fuel consumption now and has taken over the railroads, and will likely take action on many other things. Now, if this is all right and good, which it is, maybe it will find it necessary to do likewise to the road building. The need for good roads is tantamount with the need of most any other improvement in our country.—R. A. JENKINS.

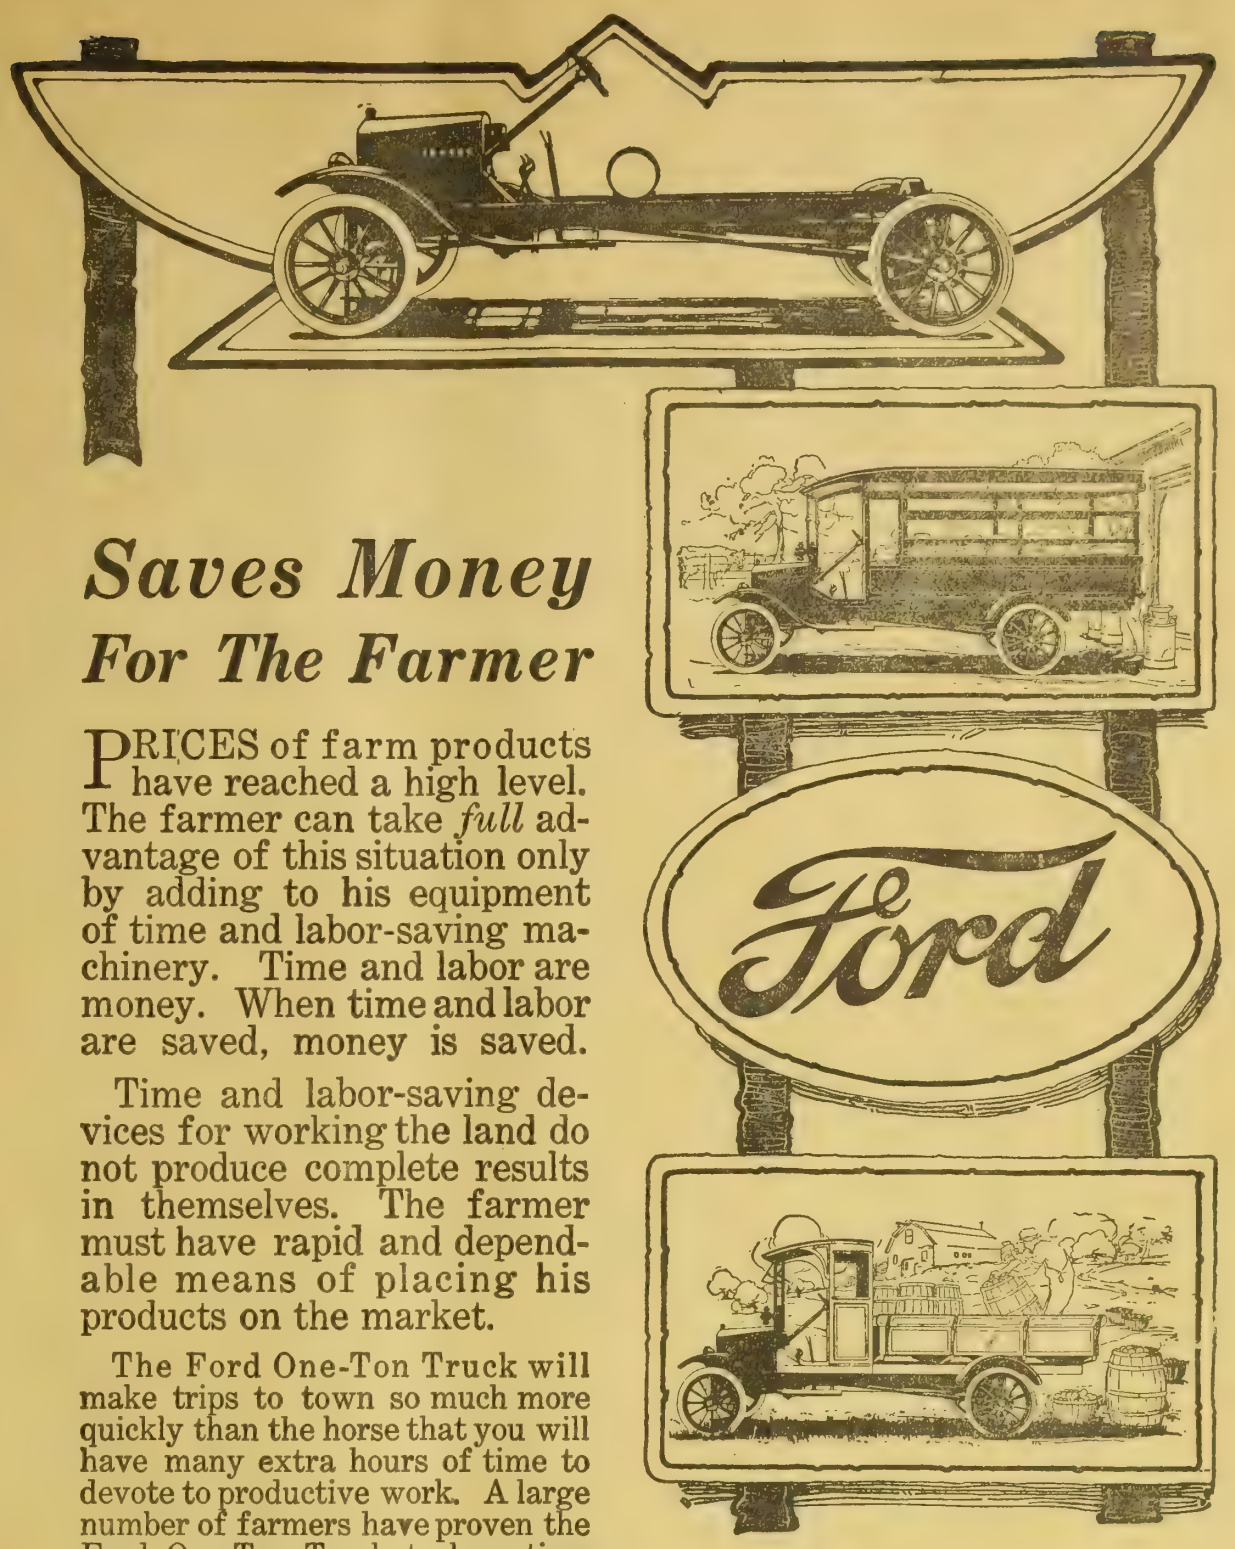
PAINT PROLONGS THE LIFE OF BUILDINGS

It is very important that the buildings on the farm be kept painted, and a good quality of paint should be used, even at this time of high prices. Probably more farmers have postponed jobs of painting this year than ever before because of the high price of paint and labor, yet they are making very serious mistakes in this matter.

Paint is high in price, but since it is so necessary to the preservation of frame buildings, to say nothing of the improvement in appearance, the work should not be neglected. For several years past lumber has been increasing in price and one should be very careful in preserving all the materials now put into farm buildings. There is a temptation now to purchase the cheaper grades of paint when decision to paint has really been made, but this is a very bad practice. The price of labor is such that it does not pay to hire high-priced labor and then put it on a job that must be gone over in a few years.

A good, high-priced paint ought to stand on the ordinary building at least six years; while a cheap paint must be renewed in a much less time, thus making a second cost for labor. In remodeling a house recently, a man repainted a coat that had been put on seven years ago, and he had at that time bought the very best grade of paint. The paint was not then in bad condition but the remodeling called for a new coat. In seven years' time unpainted boards would have shown much decay. A job of painting that will last eleven years is much more economical than a cheap coat that must be replaced in three years, and is far better than to leave a building stand without paint.

In a drive of some 170 miles, through rich farming districts, 60 per cent. of the farm buildings showed a need of paint, and in some cases houses, even, had been allowed to stand without as much as a prime coating of paint. The appearance of these farm homes was greatly marred by this neglect and close observation would have revealed a loss of lumber by decay. Paint has two very strong things to recommend it—it is a beautifier and also a preservative.



Saves Money
For The Farmer

PRICES of farm products have reached a high level. The farmer can take *full* advantage of this situation only by adding to his equipment of time and labor-saving machinery. Time and labor are money. When time and labor are saved, money is saved.

Time and labor-saving devices for working the land do not produce complete results in themselves. The farmer must have rapid and dependable means of placing his products on the market.

The Ford One-Ton Truck will make trips to town so much more quickly than the horse that you will have many extra hours of time to devote to productive work. A large number of farmers have proven the Ford One-Ton Truck to be a time and money-saver—have you?

CRIMINALLY CARELESS SHOULD BE PUNISHED

Canada is careless, criminally careless, in the matter of fire waste. The Monetary Times reports the fire losses for January as $2,688,556, an increase over January of last year of $777,896. Twenty-eight lives were also sacrificed.

It might have been expected that, with the rush of war work, the larger portion of this loss would have been in factories. This was not the case. By far the greater portion was in apartment houses and business blocks, hotels, and in reisdences. It is plain, therefore, that carelessness was the main cause. What this carelessness means may be illustrated by the conditions found by a fire inspector in one Canadian city. He found 68 defective furnaces or pipes too close to woodwork, 157 stoves not protected from woodwork, 140 cases where combustible material should be removed, 122 danegrous and defective chimneys, 46 ash piles too close to partitions, 127 electric wires in contact with nails, 80 defective boiler rooms and 40 cases where gasolene was improperly stored.

In addition to the above, conditions such as endangered life were: 133 obstructed fire escapes, 387 alarm gongs and 188 red exit lights out of odor, 90 fire escapes without direction pointers indicating where they were situated and 17 defective operating rooms in theatres.

All of the first hazards above-mentioned are contrary to law and it is time that the responsibility of maintaining such dangerous conditions should be brought home to those who are guilty of maintaining them. Section 247 of the Criminal Code of Canada makes it a criminal offence to omit taking reasonable precautions and using reasonable care to avoid danger to life. The necessary legislation is provided; it only requires enforcement.

In altogether too many cases fire destroys the evidence pointing to its cause; otherwise, many coroners' inquests would show more effective results than at present. As it is these inquests are very meagre recompense for the many lives which are sacrificed through lack of care.

I am the road
That carries the load
From countryside to town.
If you drag me true
I will pull for you.
And never mire you down.

You can usually tell a farmer by the hay he makes.

Two Cents a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word, each insertion. MARITIME FARMER, Sussex N. B.

FOR SALE—A few Sheep both sex of any popular breeds.—CEPHAS NUNN, Winsloe, P. E. I.

PICKLING ONIONS FOR SALE. H. E. GOLDING, Sussex, N. B.

FOR SALE.—Ayrshire Bull Calves, R. O. P. Ancestors, also pure bred Collie Pups A. A. R. MARGISON, East Centreville, N. B.

FOR SALE—Several litters of Yorkshire pigs for sale. Not registered. Prices moderate.—G. K. COLDWELL, Wallbrook, Kings Co., N. S.

FOR SALE—Two pure bred Lincoln ram lambs; one shearling ram.—C. W. PUGSLEY, Barronsfield, N. S.

FOR SALE—Registered Holstein heifer calves, six months old F W. C. NASE, Nerepis Station, N. B.

FOR SALE—100 dark furred Nova Scotia ranch bred mink I raise them and teach purchasers how.—DAVID A. McRAE, West Middle River, Vic. Co., N. S.

FOR SALE.—One Thoroughbred Reg. Shorthorn Bull 24 mos. old, also one pure bred Shorthorn Bull Calf 5 mos. old. WM. B. HAWKINS, Millville, York Co.

PORTRAIT AGENTS WANTED—Send for catalogue. Prints Solar and Bromide Finished portraits, convex or flat. Frames, glass and other supplies.—MERCHANTS PORTRAIT CO., Toronto.

LADIES WANTED to do plain and light sewing at home, whole or spare time, good pay, work sent any distance, charges paid. Send stamp for particulars. NATIONAL MANUFACTURING COMPANY, Montreal.

A RANCHER'S LIFE in Canada and Guide to Rural Industries, fruit growing, poultry keeping, ducks, geese, turkeys, pigeons, hares, goats, bees, flowers, etc. 25c post paid. By C. H. PROVAN, Langley Fort, British Columbia.

AGENTS WANTED—$1000 - You can make it in your county with our fast selling Combination Cooker. One salesman banks $388 55 the first month. Another agent sells 20 in two hours. Others cleaning up $10 daily. No capital necessary. Goods shipped to reliable men on ime. Territory going fast. Write quick to secure your field—COMBINATION PRODUCTS CO., Foster, Que.

Springbrook Farm Ayrshires !

Holstein Bull For Sale !

The Holstein Bull, Mercena Bill Abbekerk, 34308, will be an outstanding attraction at the big Live Stock display at Fredericton on November 7th. He is about ⅞ white, straight with abundance of constitution and quality.

His Dam, the great Maple Grove Belle 2nd, 6540, with a three year old R.O.P record of 12.594 lbs. milk, containing, 523.77 pounds butter. A wonderful record of 12,000 pounds as a 2 year old, and was purchased by Fred F. Field, the owner of the $35.000 bull for a very large sum. Maple Grove Belle 2nd's Sire was a son of Tidy Abbekerk, one of the greatest producing and reproducing cows of the breed. Maple Grove Belle 2nd is bred along the same lines as Madame Posch Pauline 10291, the great champion Holstein Cow.

Mercena Bill Abbekerk is by Maple Grove Mercena Mercedes, a bull who never sired a tested daughter under 4% and who is one of the best bred bulls in Canada. Mercena Bill Abbekerk has for a full sister, Lady Belle Mercena, with 24 lb. record as a senior 3 year old testing 4%, a wonderfully persistent milker, capable of 20,000 lb. record. His half sister Dewdrop Colantha, has 15.45 lbs. of butter to her credit as a junior 3 year old. Another ¾ sister Abbekerk Queen Countess with over 30 lbs. of butter test 4.6%

His half brother, on his dam's side, heads one of Ontario's largest herds, where he has a long list of R.O.M. daughters.

This is a wonderfully bred young bull, fit to head any herd. Look him up at the sale.

BREMNER FARM,

FOR SALE

Young Berkshire pigs! The large, prolific, easy-feeding kind. Also Jersey Bulls from two months to two years old. All at reasonable prices.

J. R. SEMPLE & SONS,
Truro, N. S.

Record of Performance Ayrshires

Two bulls fit for service. Ask about them. Young cows. Do you want any ? A pair of yearling heifers. A chance for someone to start easy. Write if you are interested,

THOMAS J. HAWKINS
"Lone Pine Farm" - - Stewiacke, Col. Co., N. S.

FOR SALE !

In Shorthorns we have to offer a number of roans, reds and whites in both males and females, from young calves up. It would pay those wishing to purchase to come and see our stock before doing otherwise.

Our spring litters of Berkshires are all sold. Are expecting several summer and fall litters. Parties wishing to purchase please get in touch with us.

L. M. ANDERSON, Sackville, N. B.

QUALITY BRAND
Rabbitry and Poultry Yards

Amherst, Nova Scotia
E. I. PEEL & SON, Proprietors

Breeders of pedigreed Hares, White Rock and White Leghorn Fowl.

Black Siberian Hares, the most profitable fur bearing animal living, price per pair...$25.00
Silver Siberians, price per pair..... 5.00
Belgians, price per pair 3 00
The above prices apply to stock under 3 mos. old
Day-old White Leghorn Chicks, price 25c each
D. W. Young's stock, as good as money can buy.
White Leghorn 260 egg strain for hatching..... $2.00 per 15
White Leghorn, No. 1 exhibition stock for hatching..... $4.00 per 15
We Guarantee Safe Delivery. Terms Cash with Order

AYRSHIRES BULLS !

fit for service, bred from heavy producing stock.

Pure Bred Poultry !

Barred Plymouth Rocks, White Wyandottes, R. I. Reds, Brown Leghorns, and W. C. Black Polands Cockerels and pullets from good laying strain for sale at lowest prices. Satisfaction guaranteed or money refunded. Address,

H. M. McMONAGLE,
Box 652, Fredericton, N. B.

COST OF KEEPING WORK HORSES

Results of investigations on the cost or horse labor on the farm by the University of Missouri College of Agriculture show that, exclusive of depreciation, the average cost of keep per head of 75 farm work horses during 1912-13 was $92.33; of 113 head for 1914, $95.58 and of 132 head for 1915, $86.63, or an average for the whole period of $91.22. It was found that th ecost of feeding, as a rulemade up 72 per cent of the total cost of keeping a farm work horse. Farms on which the feed cost per head ran lowest (average $45.6⁵ per head) fed an average of 10.3 bushels of oats per head of work stock, while farms on which the feed cost per head ran highest (average $93.2⁵ per head) fed an average of 41.6 bushels of oats per head of work stock. The average amount of labor per horse for 1912-13, 1914 and 1915 was found to be 1,164 hours, and 1,127 hours respectively. The heaviest working of horses with the most liberal feeding or the lightest working with approximately a maintenance ration did not in general prove as economical from the viewpoint of horse labor cost as medium work on a moderate ration. From the viewpoint of economy, experience seems to warrant keeping sufficient work stock on a general farm, so that each horse will not have more than an aaverage of 1,400 or 1,500 hours work, but it will not warrant a large enough supply to make the average amount of labor per horse less than 800 hours. Records from the farms indicate that mules do more work on a given cost than either geldings or mares, and likewise geldings do more work than mares.

It is essential in a season like the present, when a good day's work from a horse is more important than it has ever been that the horse be kept in best possible condition. Farm work horses usually carry less flesh in summer than in winter and this is probably a safer condition for the hot weather. But while hard-worked horses are bound to lose flesh in summer time, they should not be allowed to get so thin as to lessen their strength and ability to do hard work. Work horses, like men, need plenty of good wholesome feed given at regular intervals. A mixture of corn and oats, one-half each, and good hay fed in sufficient quantities is as satisfactory under all conditions as any ration.

Work horses enjoy a cool lot or small pasture at night and do better there than in a hot and often dirty stable. The privilege of drinking frequently and in small quantities refreshes horses doing hard work in hot weather. Sore shoulders may be lessened by making certain that the collars fit the horses' necks properly, and by washing both the neck and collar each night.

At the University of Missouri it was found that mares nursing foals lost 77 pounds in weight between April 22 and May 20. They lost 44 pounds between May 20 and August 12, or a total of 171 pounds from April 22 to August 12. By December 30 these mares had gained 269 pounds which was a recovery from the effects of a hard summer. Mares not nursing foals, underwent about the same changes, but ate less feed during the summer.

Volume 24. SUSSEX, NEW BRUNSWICK, OCTOBER 22, 1918. Number 2.

Report of Women's Institutes of New Brunswick in Sixth Annual Convention.

The Sixth Annual Convention of Women's Institutes of the Province of New Brunswick was held Oct. 1, 2, 3, at Fredericton, N. B., in the Provincial Normal School building of that city.

A splendid programme had been prepared by Miss Hazel mcCain, Supervisor of Women's Institutes for New Brunswick, a programme dealing with a wide variety of subjects, each touching some particular aspect of the world war, splendidly prepared addresses which were heard, we are sure, with profit by all who had the good fortune to attend the convention. Right here may we congratulate the Women's Institutes of New Brunswick on their good fortune in having so capable a leader as Miss Hazel McCain. One has only to talk a short time with Miss McCain to know that she is in the work with her whole heart and soul, and we are certain that under her capable direction and with the assistance of the very efficient young women of her staff, who have so ably demonstrated their ability this past summer, that the Institutes of N. B. will benefit and grow as never before.

Congratulations also to the Department on their choice of a lecturer for their W. I.'s, Mrs. J. W. V. Lawlor, a woman particularly gifted in bringing her subject before her audience in a most clear, concise, and intelligent manner, and one fitted by education to address her audience in either the French or English language. You have all heard her and we are confident have listened to her with pleasure and profited by the message she brought to you. We will hope that she will continue with the Department and that we will all have the pleasure of listening to her again.

Tuesday mornings meeting opened with a good attendance of delegates, about 100 ladies being present. After the singing of "O Canada", Hon. J. F. Tweeddale, Minister of Agriculture, gave the address of welcome. He extended a most hearty welcome to the ladies who had come to review the work of the past year, have an interchange of ideas, and organize their work for the future. He assured them that every hospitality, consideration and kindness would be extended by the citizens of Fredericton. He spoke of the noble work, the untiring zeal and indefatigable energy of the Women's Institutes in doing their part since the war began, of the noble part our women have played, the patience, endurance, skill of nurses and the self sacrifice of the women, placing them second only to our brave boys at the front. He spoke also of his pleasure in the growth of the Institute, the membership being now nearly 3,000 strong, and in closing invoked the guidance of a Divine Providence on the deliberations and arrangements for another years work by the Institutes.

Mrs. Frank Baird of Woodstock replied to the address of welcome in a most pleasing manner, thanking the Minister of Agriculture for his warm welcome to the representatives of the Women's Institutes of the Province. She spoke of the good that must come from the women of New Brunswick, who are handed together in order to improve the home and home surroundings. We women shall be known by what we do! What have we done? Have we all been true and steadfast? "Not to think of things remote and subtle, that which before us lies is the prime wisdom." Could the Women's Institutes have a more fitting watchword. She spoke of our duty to uphold the regulations of the Canada Food Board and see that they are carried out. Bonar Law has said "We must live more simple lives" and it is of the utmost importance that we should do so. We should hold the lines at home while our boys hold them across the sea. She said in closing "the purpose of this meeting will be fulfilled if we return to our respective homes with more zeal for the carrying on of the work of our homes and our churches, of the Daughters of the Empire, of our Red Cross and Soldiers Comforts Societies, and the Women's Institutes of our respective communities."

Miss Hazel McCain then gave the report of Supervisor. It showed a most encouraging and healthy growth for the year. Since last year fifteen new branches have been organized, 13 organizing in July and August, making a possible membership of 3,000. Many more centres both English and French are inquiring concerning organization, and the outlook is most hopeful.

Miss McCain reported 12 Institutes organized among our French speaking people, this department opened and conducted by Miss Alice Michaud. The receipts from 76 of the Institutes amounted to $16,288.60 and the expenditures to $13,620.19.

In response to an appeal from the Women's Auxiliary Army Corps, $1,000 were contributed by sixty of the Institutes. Many contributions have been made to the Y. M. C. A. Triangle Fund and Serbian Relief.

1,824 women and girls enrolled in the short course held at Woodstock, Fredericton, Sussex, St. John and Chatham.

The essays entered in the contest of 1917-18 have been judged, the prizes being awarded for "War Time Thrift and Economy" to Mrs. Paul Doyle, Jacquet River, Miss Vella Roy, Hoyt Station, Miss Elsie Brittain, Welsford, respectively; "Systematic House Keeping" to Miss Elizabeth Robinson, Sussex, Mrs. C. H. Spike, Andover, Mrs. M. F. B. Glen, South Tilley, respectively, and for "Advantage to a Community of Having a Womens Institute, to Mrs. Ferguson, Newcastle, Miss Marguerite Flett, Millerton, Mrs. R. C. Thompson, Chance Harbor, respectively.

Miss McCain told of a Wheat Substitute that has been compiled and is now in the press, and in a few days time will be available for all, also of a Milk and Meat Substitute bulletin, which will follow this. She also spoke of a movement now in progress in the West to make the Womens Institutes and similar organizations a National Organization, and expressed the hope that this convention should place on record as being ready and willing to unite with the Western Provinces in bringing about such an organization.

Miss McCain then closed her address with a stirring appeal to the women of New Brunswick to rouse themselves, and rising above all petty differences put their shoulder to the great wheel of progress of civilization and shove.

After the registration of the delegates and appointment of committees of resolutions, the morning session adjourned.

Tuesday, 2 P.M.

Miss McCain presiding in the absence of Mrs. F. O. Erb, Hillsboro, who was to have taken the chair.

Report of Institutes.

A vocal selection was then rendered by Miss Edna Baird of Fredericton, which was much appreciated by all present, followed by an address and demonstration of the "Influence of Music in Home and School" by Professore Frank W. Harrison, Instructor in Music in Public Schools of Fredericton. This paper was dealt with in an able and interesting manner, a very convincing argument in favor of General Instruction in the Rudiments of Music in Public Schools.

Tuesday, 8 P. M.

The evening meeting was presided over by Miss Helen Hutchings of Rothesay, who in a most tactful manner introduced the first speaker of the evening, Dr. W. S. Carter, Supt. of Education for New Brunswick.

Dr. Carter's address dealt with the "Relation of the Home and School" and won hearty applause from the delegates present. He spoke of the serious problems confronting the educational department of the province, and asked for co-operation in the educational work. He referred to the inroads made upon the teaching profession by war's demands, of the loss of competent instructors caused by our province not raising the salaries in keeping with the salaries paid in the West, out best material is going that way, and they are not to be blamed. Banks, offices and industrial plants are employing women at wages more inviting than are offered to the trained teacher, something must be done to make the work more inviting, more money is needed here, and provision must be made to secure it in order to have increased salaries.

He advised the formation of associations that would bring together the parents, and teachers in the country districts, and spoke in glowing terms of the Parent-Teachers Association of the towns of St. Stephen and Milltown in Charlotte County, and also testified to the excellent work of Women Trustees on the school boards. He spoke briefly on School Consolidation and School Sanitation, urging the women to look after the sanitary conditions of the school in their vicinity, and gave an interesting account of his recent visit to the open air and forest schools of Toronto.

Mrs. Frank Good then favored the convention with a solo, "When the boys come home", sung with great feeling, as she could so well do, having two of her own boys at present "over there."

Hon. W. F. Roberts, M.D., of St. John, was then called upon to address the meeting on "Medical Inspection in the Public Schools."

Dr. Roberts is the Minister of the recently established Department of Health by the Provincial Government, and his address was listened to with great interest. This address and also that of Professor Harrison, will be published in full in an early issue of the Maritime Farmer.

Wednesday, 9.30 A. M.

Miss McCain, in the absence of Mrs. James Porter of Andover, conducted this meeting.

Report of Institutes continued.

These reports showed a tremendous amount of work being done by the Women's Institutes of New Brunswick particularly along patriotic lines, although their community work was by no means forgotten. The many calls from the Red Cross, Halifax School for the Blind, Women's Auxiliary Army Corps, etc., had been generously responded to and the majority of Institutes were supporting one or more prisoners of war, and knitting an amazing number of pairs of socks. The account of work done and the interchange of ideas contained in these reports were very inspiring.

Miss Nutter, Demonstrator for the Department, reported 40 demonstrations held in the eastern and southern sections of the province, 36 on Wheat substitutes, 1 sewing, 2 canning, and 2 Home Nursing. A very creditable report.

Miss Michaud, also on the staff of the department and whose work lies particularly with the French members of our province, reported 13 demonstrations held, 9 in Madawaska, 2 in Kent, and 1 in Westmorland.

The remainder of the morning was devoted to work connected with the Red Cross and Daughters of the Empire.

(Continued on page 41)

The Plow, Plowman and Conservation of Power

How Plow Accessories and Their Adjustments are Regulated to Execute Their work in Masterly Style with Conservation of Power in the Team or Gasoline in the Tractor

Plowing is still the most laborious and expensive tillage or cultural operation on the farm. Civilization and the plow has been associated in all times. The earliest records of civilization and agriculture mention the plow. In its primitive form the plow was simply a forked stick from a tree, which was drawn, while plowing, by men or oxen in the earlier stages, and now by horses and tractors. The word agriculture comes from the plowing, and the letter "a" in the alphabet is derived from the forked stick, which has gradually been developed into the modern plow.

There are many different forms of plows and methods of plowing today. It is a part of the operations on a farm on which success to the enterprise largely comes. When to plow—in fall or spring—how deep, how wide for the different crops and soils, become questions of very great importance to agriculture, for on the way that soil is handled in the plowing depends the availability of plant food from the soil to the crop. As soils differe in texture and make-up, from light sand through several degrees of loam to stiff clay, the method of plowing differs. On sandy or light loam soils the plowing should be done when the ground is as full of moisture as possible, following soon after with a soil packer to conserve the moisture. On heavy clay, the plowing and tilling must be done when there is less moisture, or the ground will get into a baked condition, which becomes lumpy in cultivating, and plant food will not be available.

Adjusting the Coulter

The adjusting or "tempering" the plow to meet varying conditions is the chief art in skill in plowing, alike for the workmanship that gains a premier place in competition; for ease on horses or tractor that is doing the pulling; for comfort at work by the man who operates; and all the other qualities that make good for farm crop production or economy in labor while tilling the soil.

One of the chief accessories of the plow is the coulter, and the way the plowman sets it in position for the work, increases or decreases the draft and effects the operation of the plow generally. It should be so placed that its point is located about one and a half inches back of and half an inch above the point of the share, and it should slope back so that when in use it runs under the turning furrow instead of dragging through in a perpendicular position. When it is thus set the share lifts the soil slightly before it is cut by the coulter. If the coulter is set too far back, the share tends to tear the furrow from the landside before it is cut, thus increasing the draft. Its vertical position is also important since both the width of furrow and the running of the plow are thus affected. In general the coulter should cut as nearly as possible a vertical edge at the landside, at a point about a half inch to the landside of the plow point. **If a plow scores poorly and the coulter is set so as to cut about one inch into the land, the added width of furrow by its greater weight may cause the mould board to scour satisfactorily.** If the coulter is set so that it is twisted either towards or away from the land, it tends to act as a rudder and to cause the plow to climb and swing from side to side, regardless of the adjustment of the clevis.

Another form of coulter consists of a flat thin disc set to cut into the sod in the position usually occupied by the upright coulter. It is thinner than the knife coulter, offers slightly less resistance to the soil and, being sharper, cuts with less draft. It rolls over trash instead of catching it, but on stony ground is not a suitable arrangement as it rides over the stone and thus tends to jump the plow from the ground.

In plowing sod land which must be promptly prepared, the use of a jointer, or small plow, on the surface in place of the upright coulter is often used with advantage. It turns a small furrow about two inches deep on the edge of the regular furrow in such a way that when the main furrow is turned the edge is buried without any protruding grass or rubbish shown between furrows. Its use aids very much in the formation of a mellow seed bed.

For the covering up of long grass, surface rubbish or a cover crop, a drag chain is of great value. It consists of a short length of a common chain fastened at one end to the furrow clevis of the evener, and at the other end to the plowbeam just back of the coulter, with slack enough to allow the allow the chain to drag on the ground.

Adjusting the Plow

The ability of making a first-class piece of plowing lies more in adjusting the plow than in holding it to its work. The holding and the adjustment must be in unison, and the plowman must know how to accommodate the two together. In the walking plow it is a noteworthy fact that no two men can plow with freedom with the same adjusting. The points of difference in holding the plow has to be met with a different adjusting of some of the parts. The centre of the draft in the plow varies with the depth and width of furrow, as well as with the nature and condition of the soil, and shape of the plow. The hitch at the clevis can be adjusted either horizontally or vertically; but no matter where the hitch is, the line of draft will tend to straighten, that is to say, to assume a straight line when the horses apply their power. Thus, if the hitch has been made too far to the left side of the clevis on a right-hand plow, the end of the beam will swing to the right in order to straighten the line of draft, and as a result the plow will seek away from the land, and cut a narrow furrow. To offset this tendency, the plowman will have to lean heavily on the right handle, to keep the plow in position. On the other hand again, if the hitch at the clevis is too far to the right the plow will be swung into the land and take a wider furrow than it can turn, while the plowman will be forced to lean most of his pressure on the left handle.

On the vertical adjustment on the clevis if the hitch is placed too low it will raise the end of the beam and the plow will not keep its depth. If too high at the clevis, the plow will "ride on its nose" and tend to plunge too deeply into the soil. When all these adjustments are correct the plow will move straight ahead. Indeed in a mellow soil it will keep its place without attention from the plowman, except when encountering a root, stone or other obstruction. In no way is a plowman's skill more clearly seen than in the manner in which he is able accurately to make these adjustments.

The condition of the point and the cutting edge of the share also affects the service of a plow. A worn or rounded point should be renewed. It often happens that a reforged share though sharp, affects the draft of the plow as unfavorably as before sharpening, for the reason that it is warped out of line. A new ploughshare when set on a straight board should touch at the point, at the wing of the share and at the heel of the landside. At the centre is should be an eighth of an inch above the board. This curvature is called the suction of the plow and tends to keep the point in the ground and it shrould as far as possible be retained if the share is resharpened.

In testing the draft of a plow, it is found that 55 per cent. is due to the work exerted in cutting the furrow slice, 35 per cent. to the friction of the plow against the sole and furrow and only 10 per cent. to the work exerted in lifting and turning the furrow. Since half the power required to draw a plow is used in cutting the bottom and side of the furrow slice, it is highly desirable that coulters and shares should be in prime condition and properly adjusted.

This is necessary both for the conservation of horse power in the team or in saving gasoline in the tractor. **The competitor at the match as well as the everyday plowman at home cannot produce the plowing that is level, straight-furrowed and well turned if he is fighting all the time against his plow's adjustment.** The work that is easy on the plowman and power is

Move Feed Quick or Can't Get 'Em

This is Warning Issued from Railway Circles--- Transportation will be Taxed to the Limit

The feed question is one that keeps changing so rapidly that it is hard to follow it. There was a prospect that Cotton Seed Meal would find its way from the United States to Canada, but this hope, slight as it was, is now dashed to the ground. There will be no Cotton Seed Meal, or that is the way it looks. If this is so, then a very valuable feed has been cut off from the Canadian Market. Oil cake is scarce and the latest quotation is in the vicinity of $75 per ton, delivered at Maritime points.

Concerning Standard feeds, there has been a drop in the molasses grades of three dollars per ton and the new prices will be found as usual below. In connection with the purchase of mixed feeds, the Maritime Farmer would again caution buyers to insist upon getting the analysis of all feeds bought. Don't buy feeds simply because they are cheap from a dollar and cents standpoint. We know of a feed of ten per cent protein, which some dealers have been selling for from $55 to $58 per ton. Take ground special. It sells delivered for from $40.50 per ton f. o. b. St. John to about $42.00 average Nova Scotia points. Yet Ground Special tests 13.7 protein and 4 fat. Do you see the point? When you buy feeds, make the man who sells it to you produce the evidence that he is supplying you with something of value to you and your stock. Feeds are being offered which test as low as six protein and 2 fat. Just as well feed straw.

The Maritime Farmer has opened up new accounts with Agricultural Societies. We will get you feed, if you co-operate. We will send it to you at wholesale prices, that rule on the day you order. We have already sent out $75,000 worth of feeds to agricultural societies. We have saved them thousands of dollars. What is your society doing about it? Is it dead to its possibilities? If it is bring it to life and get in the co-operative game.

The prices of feeds, f. o. b. Fort William, to which must be added exchange and interest, are:

COMPARATIVE ANALYSES

	Ground Special	Ground Standard	Molasses Hog Feed	Molasses Dairy (about)
Moisture	12.80	13.13	10.78	11.00
Crude Protein	13.31	14.38	18.42	17.00
Ether Extract (fat)	4.00	4.92	6.49	4.5
Crude Fibre	18.81	10.32	14.00	15.00
Carbohydrates	64.11	67.96	55.58	62.00

	1918 Bran Average	1918 Midds. Average
Moisture	11.35	11.03
Crude Protein	14.91	17.09
Ether Extract (fat)	3.99	5.33
Crude Fibre	12.43	10.89
Carbohydrates	63.50	62.23

PRICES

Ground Special	$32.00 per ton
Ground Standard	$47.00 " "
Molasses Dairy	$42.00 " "
Molasses Hog Feed	$52.00 " "

These prices are all subject to change without notice. This is not a quotation, but is the last price the mill submitted to us.

Note high protein and fat content of Molasses Dairy feed.

the work that is of the greatest merit to competitor or industry.

A very common fault found in harnessing the team and one that affects the power, is where the straps over the horse's croup, that ar intended to hold up the tugs are too short, and an angle is formed when the horse pulls, giving a downward pull on the straps and a third of the animal's power is used to gall and annoy instead of being applied to the work on hand.

NO COTTON SEED MEAL

Recently the Maritime Farmer applied to the Canada Food Board for fifteen cars of Cotton Seed Meal with the idea of distributing it through Agricultural Societies. A short time ago it looked as if there would be a chance of getting some through, but the following letter from G. M. Morgan of the Export and Import Section of the Food Board, shows that there is little expectation of getting cotton seed this year. The letter is as follows:—

Ottawa, October 11th, 1918.

Dear Sirs:—

Re—COTTONSEED MEAL.

I have your favor of the 8th instant regarding the importation of cottonseed meal.

I would advise in this connection that the United States Administration have placed cottonseed meal on their conservation list and at the present time will allow no exportation. We are endeavoring to secure an allotment for Canadian Trade, if successful publicity will be given through the daily press.

Yours faithfully,
CANADA FOOD BOARD.
Per: G. M. Morgan
Export & Import Section.

James D. McKenna, Esqr.,
Sussex, N. B.

MIDDLINGS AND BRAN SCARCE

Bran and middlings are scarce. Some mills are offering as low as 50 bags of each to the car. Prices quoted wholesale are bran, New Brunswick points, $39.90; Nova Scotia, $41.10; Middlings, New Brunswick, $44.90; Nova Scotia, $46.10. War quality flour is $11.69 per barrel, in bags, New Brunswick and $11.81, Nova Scotia. Ontario wheat flours range 15 cents per barrel lower.

NEXT SUMMER'S HOG-PASTURE

It is not too early to plan for next summer's hog-pasture. Present and probable feed conditions force the swine feeder to consider home-grown foods. Pasture crops are economical at any time,—nowadays doubly so. Dry sows may bc maintained with very little, if any, grain on clover or rape pasture. The same may form the great part of the in-pig sow's summer ration. The latter should, however, be fed once daily with a few pounds of a light meal mixture, bran, shorts, ground oats, elevator screenings (Standard Stock Food), etc. The growing pig, after twelve weeks of age, will consume pasturage economically, and maximum rapidity of gains may eb expected with pasture and either the hand or self-feeding systems. The self-feeder-pasture-plan has proved entirely satisfactory on the Experimental Farms system and upon hundreds of private farms during the past summer. Labour and feed have been saved. Green food has replaced much grain, and hogs finished for market in less time.

For general recommendation, possibly clover comes first. With a self-feeder, thirty-five or forty three-months-old pigs per acre will be required to keep down the growth in a normal year. As the pigs grow they may be removed so that the pasture may not suffer, depending on the season.

Alfalfa, where it may be grown successfully, is equal, if not superior, to clover. It affords very early pasture and is particularly useful for the early litters.

Where no provision has been made for either of the foregoing leguminous crops, fall rye heavily seeded this fall will supply an excellent pasture next spring, available possibly the earliest of all. After it has been pastured off the land is still available for a second crop next year of, say, turnips, or a later seeding of rape.

A heavy seeding of barley, to be pastured when six inches hih, has given excellent satisfaction at Ottawa. Enough pigs should be placed on such pasture to keep it pretty well grazed at first, depending upon the season.

For general utility, rape is to be highly recommended. A crop of rape, ready for pasture after the clover paddock has been fairly well cleaned off, supplies a change of food at a time when the pig can economically use this crop and gives the clover aftermath a chance to grow for later pasture. There is no better commercial hog pasture combination for eastern Canada than clover and rape. Under normal condition it will carry more pigs for a greater period, and prove more palatable than possibly any other.

Many factors influence the hog-carrying powers of various pastures. Where a self-feeder is used and the pigs are from ten to twelve weeks old, do not be afraid of over-pasturing for a while at least, pasturing with rape. More grazing will be obtained from any pasture crop where it is kept down during the first few weeks of pasturing. Later the feeder's own judgment will indicate whether or not pigs should be removed. Hard and fast rules are difficult to frame and unlikely to apply in many cases.

SPECIAL FEEDING OF EWES AT MATING TIME PRODUCES MORE AND BETTER LAMBS

After buying and selecting the sheep for breeding, comes the feeding and treating the flofick so that their progeny will secure the highest attainment of profit. Selection is only a good first step in the business, it is the gentleman part of the work, what follows is the hard, persistent work to reach the ideal end.

The work in the fall which is followed by success in spring and summer is largely along lines of feeding. The first principle of breeding that all farmers either with small or large flocks of sheep or even dairy cows should constantly keep in mind, is that poor animals of any kind should not be set apart to breed if strong, healthy offspring are desired. Special feeding of ewes during fall hastens forward the period of tupping time and strong, early lambs is the result. Put the ewes on stimulating pasture and have a patch of rape ready for them. Before mating time rams and ewes should be well conditioned. It pays to give them extra feed, because they produce larger, stronger, earlier and thriftier lambs.

There are other advantages in having the ewes in strong condition when they are mated. A shorter lambing season is insured, as lambs are dropped more nearly together and there will be a larger number of them than if the ewes were in poor condition.

"Flushing" the Flock

When ewes are all in uniformly good condition they will come to the ram more regularly and be more likely to get in lamb. If the ram service is properly arranged, the majority of the ewes will get in lamb about the same time.

Considerable attention is required for lambing ewes, especially for those producing their first lambs. It is easier for their caretaker to look after them at lambing each day and night for a short time than to have them coming straggling along through several weeks. The lambs are then uniform in size and get well started under the same conditions.

After the lambs have been weaned, the ewes will be better to be kept on short pasture till their milk has stopped. After this, if there is good pasture to place them on, nothing more is ordinarily required; but if that is not available rape, rye or other forage crop should be provided. If none of these are obtainable a light ration of grain, presumably oats for most part, should be given. In commencing to pasture them upon rape or rye, an hour or two the first days will be ample till they become accustomed to the change.

Where flocks are treated by "flushing" or specially treated as described, the percentage of barrenness amongst ewes is less than with those untreated. These facts are well known to farmers who consistently practice the method of liberally treating their sheep during tupping time on their farms.

Producing Twin Bearers

Though a single early lamb has the best chance to get the early market and will command a good price, most farmers like to see twin lambs at birth. Nothing in breeding is more susceptible to the influence of heredity than fertility, and ewes and lambs of the twin bearing characteristic should be annually selected. To choose the females from the farm flock that is to be set apart for breeding is an easy matter where records of their breeding are kept; but very often the system falls down in selecting the ram. A large percentage of the ram lambs at exhibition and sale rings are single born. The strongest lambs are assuredly chosen and invariably the greater percentage of them are single born. They are readily bought for breeding purposes. This practice will nullify the work of the breeder who has chosen the twin bearing females to mate with him.

In order to get strong lambs it is preferable to have a sire one year old or over. For a flock of about 15 ewes a ram lamb is generally chosen, but that is the maximum number a ram lamb should get. A well developed rightly chosen ram lamb will give good results in a small flock and will be a mor eprofitable purchase when selling again. When the number of ewes run up to twenty and over then an older ram should be chosen. A ram that is a yearling or over, when running in the field with the ewes should serve fifty ewes. To do this he should be taken out and fed grain at least once a day.

"Flushing" the Ram

Flushing the ram as well as the ewes is also necessary to the prolificacy and surety of the ram. The best way to practice this is to shut up the ram during the day and feed him well, then let him run with the ewes during the night. It is harmful to the fertility of the ram to be left with the ewes all the time, especially if there is a fairly large flock of ewes. He may be so occupied with ewes in season that he will neglect to feed, and inability to produce progeny will be the result. More ewes are tupped in the night time than in the day. The ram will soon get accustomed to the usage and will seek the barn yard by day for the extra feed. They should be tame and are thus easily handled and caught in the field. Hand feeding is the medium of success in this work.

It is also of great advantage to the ewes to have them tame at this season. Dogs, especially the average mongrey type found around farms are as abomination to the sheep industry, and do more destruction to breeding sheep at tupping time than is generally believed or known. It takes more skill to train a sheep dog and to handle sheep successfully and quietly with him than the farmer with the mixed farm has time for, and the farmer will be acting in his own interest with the flock of ewes if he dispenses with the dog altogether.

Increase in Number of Lambs per Ewe

Many experiments have been tried out in sheep breeding countries proving the influence that treating the ewes at mating time, and the selection of twin bearers as of valuable utility to the sheep breeder in the annual increase of his lambs per ewe. In Scotland, the Highland or native breed of sheep are perhaps the lowest in fertility of any breed, usually not moer than one lamb per ewe. When shepherds began to take their sheep from the mountains in the fall and winter to feed on the more fertile alleys and flat lands by the sea shore, twin bearing became common. Flocks are divided into 400 ewes, the quantity that one shepherd can attend to, and with this size of a flock as a unit many experiments have been tried to test the fertility of flushing at mating time. Flocks that only produced 400 lambs on the average has records up to 640 or 160 lambs per 100 ewes.

From one flock 60 ewes were promiscuously selected and fed specially on rape and grain at mating time, and the result was that 50 of the ewes had twins and 4 of them had triplets. Flocks that had a record of one lamb per ewe were equally divided and treated differently, and the result of better feeding at mating time always raised the number and strength of lambs in spring.

Some flock masters in England carried out extensive tests with Hampshire sheep, and breeding continuously from twin bearers has resulted in flocks returning 200 lambs per 100 ewes. Ewes that are abnormally fat are not good breeders, and the same is true of undernourished ewes. Farmers who wish to have the flock of thrifty ewes must keep the flock in a thrifty uniform condition. When a ewe gets to the stage of over fat, and many breeds show this tendency, they should be dispensed with to the butcher.

Every endeavor should be made by the farmer with the small or large flock to have all ewes in the same condition. They should be as one unit coming into heat all at the same time. It is not at all a difficult matter to get to this stage of perfection in sheep management, it just requires a little close observation and sheep sense. No success will come to the sheep industry around the farm with haphazard attention being meted out to them, and farmers who are encouraged, by this idea, to go in for sheep, better get wise right now and prepare themselves for something different. There is money in sheep, but they only walk the golden hoof when properly handled.

TEN WAYS TO KILL AN ASSOCIATION

1. Don't come to the meetings.
2. But if you do come late.
3. If the weather doesn't suit you, don't think of coming.
4. If you do not attend a meeting, find fault with the work of the officers and other members.
5. Neve raccept an office, as it is easier to criticise than to do things.
6. Nevertheless, get sore if you are not appointed on a committee, but if you are, do not attend the committee meetings.
7. If asked by the chairman to give your opinion regarding some important matter, tell how things ought to be done.
8. Do nothing more than is absolutely necessary, but when other members roll up their sleeves and willingly, unselfishly use their ability to help matters along, howl that the association is run by a clique.
9. Hold back your dues as long as possible, or don't pay at all.
10. Don't bother about getting new members. "Let George do it!"

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written comeplaint must be made to the publish er within one week from the date of any unsatisfactory transact ion, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

December 3-17

PROFITING BY INTERCHANGE OF IDEAS

Delegates from the New Brunswick Women's Institutes met in convention recently at Fredericton. Miss McCain and her capable staff had an interesting program prepared, with ample allowance for discussion. The subjects dealt with by the respective speakers as reported elsewhere in this issue, were replete with ideas that the various delegates will do well to communicate to their home institutes.

Not long ago, a writer in one of our valued exchanges, writing in the personal pronoun said: "Suppose you have a dollar and I have a dollar. If I give you my dollar and you give me your dollarfi we will each have a dollar and neither one of us will be any richer than we were before we made the exchange. If, however, you have one idea and I have one idea, and we exchange these ideas, then you will have two ideas and I will have two ideas. We will both profit by the interchange." Delegates came to the Convention to bring ideas from their respective districts and to glean ideas from delegates from other parts of the province. They have personally benefitted by the interchange and have returned to their homes where they will impart to their co-operators in the "For Home and Country" cause the good things they learned from delegates and institute speakers at Fredericton.

During the Convention it was announced that in future the Maritime Farmer would be the official organ of the New Brunswick Women's Institutes. In assuming this responsibility, the Maritime Farmer is always ready to have its columns serve as a central, where the various institutes may exchange ideas that will be helpful to all.

May we suggest that each institute in the province appoint one or two of its members as Press Committee, whose duty it will be to forward the official organ for publication, items of general interest from their Institutes, as well as interesting papers that members of their institute may prepare from time to time.

Communications of this nature should be addressed to The Maritime Farmer, Sussex, N. B.

May we also suggest that the various Institutes encourage their members to whose homes the Maritime Farmer is not now going, to become subscribers, so that they too may profit by the interchange of ideas twenty-four times a year, which the columns of the Maritime Farmer afford.

Although the Maritime Farmer has been going to many of the best farm homes of Maritime Canada fo rover twenty years, it still maintains its popularity and carries on useful mission. Urban as well as rural homes, are now-a-days interested in the farmers' problems. The campaign for Increased Production necessitated by war conditions, has popularized the farmer's occupation to the extent that the foremost women of our country do not consider it degrading to toil in their war gardens or be able to talk intelligently to any of the questions relative to the production of food commodities. Men or women, who do not care to acquaint themselves with the problems that confronts God's partners, the men who are feeding our soldiers and our Allies, are positively outclassed and not up-to-date.

Members of Women's Institutes who reside in towns and cities, even if they are not directly interested in farming, will find interesting matter in the Home Department of the Maritime Farmer, and may broaden their general knowledge of food production by perusing our other departments.

THE MARITIME SEED FAIR

Growers of seed grain in the Maritime Provinces will have an excellent opportunity to bring the quality of their seed prominently before the public at the big Maritime Seed Fair which will be held in Summerside, P. E. I., early in December. A great deal of excellent grain was damaged by the frequent rainstorms that drenched the Maritime Provinces during the month of September. There will be considerable discolored grain and consequently the farmers who have been fortunate enough to have had their grain harvest completed before the wet season set in, will find it to their advantage to clean and grade their best grain and save ti for seed purposes.

It pays to advertise. The best pleace to advertise seed grain is to make entries at the seed fair and then boost the goods through the columns of the Maritime Farmer. Just because a farmer never exhibited seed grain is no reason why he should not make an exhibit this year. New beginners have frequently carried off the first honour at some of our seed fairs, in competition with some of the best seed selectors of Maritime Canada. It is a good idea to pick out several one hundred grain samples of your grain and get an authentic germination test. If your seed grain looks well, is free from foul seed, and you get a high germination test, let the public know that you have some for sale, and you will experience no difficulty in disposing of any surplus you might have. If you have not received a copy of the Maritime Seed Fair prize list, send for one without delay. Friendly competition at the Seed Fair will tend to create a reputation for good seed, and having created such a reputation, see to it that it is maintained by honest dealing.

A RAINY DAY OBSERVATION

It's raining, has been raining all night. A raw cold wind savoring of the breath of winter is blowing over the fields. Our train is bowling along through fields that are gradually changing from the green of summer to the faded greenish brown that forecasts the approach of winter. Cattle and horses are seen huddled in sheltered nooks, doing their best to protect themselves from the driving rain storm. Here and there a solitary sheep is seen tethered in the open fields with no protection from the stormy blast. Behold, these are the flock headers, seggregated from the ewes until the arrival of the breding season. We have often wondered how any humanely inclined farmer can rest in his bed at night, when conscious of the fact that one of God's creatures is so confined that it cannot protect itself from the elements.

WHO IS WHO SHOULD SHOW REASONS WHY

It is quite often the case that when a man has made a failure at carrying on a business for himself, he seeks an opportunity to try and carry on a business for the public, by wanting to hold public office. But it has often proven a fact, that a man who cannot succeed in his own private enterprises will not make good at carrying on business for the public. Unless a political candidate can point to some success he has made in his private life, he should not expect the public to support him in an effort to hold public office. How can a man be more efficient in handling the public's business than he has been in handling his own?

POTASH IN SASKATCHEWAN

A geyser 30 feet high spurts in the centre of the lake south of Prelate, in which a big deposit of potash was recently found. The scene of the deposit is a large old lake bed among the hills 32 miles due south of Prelate, Sask. There is a crystal formation to a depth of at least 42 feet, this being the extent to which tests have so far been made, and covers an area of nearly 1,000 acres. It is as solid as ice, and requires an axe to cut through the top crust, which is about four feet in thickness. Below that the substance is softer and can be dug with a spade.

The lake bears the appearance of a soft old slough and waders are needed to reach the solid formation in the centre. There ar several smaller deposits of the same mineral near the larger one and claims are being registered every day.

For some years past the settlers in the vicinity have been hauling crystals home for stock, and they say that in the winter a geyser spurts out of the centre of the lake to a height of some 30 feet, and it is so warm that the steam forms a continual fog over the surface of the lake. A visitor put an axe down one of the spring holes and in the space of a minute the axe became very warm, indicating the existence of a hot spring beneath the surface.

Inspector Tait, of the provincial police force, speaking of the recent discovery of potash in the Maple Creek district, stated that people there had practically tented on the ground during the first of the excitement. Hundreds of prospectors were on the land digging to get samples, which are being sent for analysis.

One report the inspector heard was to the effect that over 6,000,000 tons of practically pure potash was to be found in one section of the territory just east of the original discovery.

* * *

A rainy day on the farm is a very good time to sweep the cobwebs and sweeten up the inside of the hen house and the barns with whitewash and some good disinfectants.

* * *

The man who doesn't stop to figure on whether or not his business is paying, very presently doesn't have any business on which to figure.

* * *

The appetite of the animals is a fair guide as to how much and the kinds of feed necessary for best results.

REPORT OF WOMEN'S INSTITUTES OF NEW BRUNSWICK IN SIXTH ANNUAL CONVENTION

(Continued from page 37)

Lady Ashburham gave a most interesting review of the work of the Red Cross in this province, showing the tremendous amount of work accomplished during the year and what the plans were for the future.

Mrs. R. F. Randolph, President of the I. O. D. E., told of the work being done by that great body of workers which she represented.

Miss Edith Staples of Marysville entertained the convention with two very delightful vocal selections.

Wednesday, 2 P. M.

Mrs. A. J. Ferguson, Newcastle, presiding.

Reports of Institutes continued.

An excellent address was given on "Food Value of Milk" by Mr. Frank Hearns of London, Ontario, which was highly instructive.

Miss Van Wart, Demonstrator, then read her report, after which Miss Helen Van Wart rendered a solo which received well merited applause.

Mrs. Lawlor then addressed the meeting on her work with the different Institutes, her tour lasting four months. She spoke particularly on "Reconstruction after the War", and laid great stress on the need of making preparation for that reconstruction which must come.

She spoke of the organization of the French Institutes, and spoke of the Colored Institute being a thing of the near future. We are living in times of big things, our view point should also be broad.

Mrs. Lawlor hoped that in time the kindergarten would be included in our curriculum, and said in closing, our first duty should be to Women's Institutes, it included all other lines of work, its success depending on each member and each individual Institute.

An invitation from Mrs. Randolph to inspect the I. O. D. E. rooms was then extended to the convention.

Miss Jean Peacock then gave a talk on "School Lunches" urging the duty of the parents to see that their children get the proper kind of lunches to establish a good healty body and mind, train the taste or mal-nutrition the result. Make the lunch box attractive, lining it with a paper napkin, with an extra one to put on the desk. Bake bread for variety in round tins, preferably dark breads wtih a few dates or raisins if possible. See that each day there is something hot included in that luncheon. See that each day's luncheon includes one article containing protein, such as meat, fish, nuts, cheese, eggs, beans, milk. One uncooked article, orange, apple, celery, lettuce, radish, etc. Some cereal product, cornmeal, bran, oats, or rye in the form of bread, and of course butter is very essential to the welfare of the growing child. Then some sweet cookies, cake or milk chocolate, always exacting the promise to eat the sweet last, and last the beverage, cocoa, milk or fruit juice. Have a Thermos bottle for this if possible.

This was a very helpful paper to those mothers who have this problem of the school lunch to face five days of each week.

Wednesday, 8 P. M.

Mrs. Lawlor presiding.

Music by Rowan's Orchestra as on the previous evenings, which was greatly enjoyed by all present.

The first on the programme was an address on "Vocational Training" by Capt. Boyd of Fredericton, who gave all present a very clear idea of the splendid work being done for the returned soldier, who now coming home finds his whole life must be reconstructed along hitherto unfamiliar lines, and how they are helped by this department to help these brave unfortunates to help themselves, and of the grateful response given to their efforts by these soldiers.

Miss Margaret Lynds, Instructor of Elecution at the Normal School, then gave a much appreciated reading, one highly amusing and in which she showed exceptional talent in portraying the different characters, but it was her encore that will live with us, the little pathetic piece which she rendered so beautifully, which brought the tears to many eyes and held such a lesson for us all.

Dr. W. C. Kierstead then gave a masterful address on "Food Control". Dr. Kierstead needs no introduction to the readers of the Maritime Farmer or throughout New Brunswick as a whole, enough to say that he brought his message and forced it home in such a manner that there could be no doubt in the minds of his hearers that if they did not co-operate to the letter of the law with the Canada Food Board, that they were no less slackers than he who turns his back on the field of battle.

Thursday, 9.30 A. M.

Miss McCain presiding.

Reports of Institutes finished.

Report of Resolution Committee. The resolutions as follows received and accepted.

Resolved that a committee be sent to petition the Provincial Government that one lady member be placed on the Censor Board for this province.

Resolved that the Medical Inspection of schools as outlined by Hon. Dr. Roberts be given the hearty approval of the meeting and that the policy of having women on the health boards of the province, be carried before the government.

Resolved that petition be carried to the Government that women be placed

on the school boards in rural districts, making it possible for other women as well as ratepayers to take these positions.

Resolved that women be placed on governing boards of hospitals. This to be put before the government.

Resolution passed thanking both Provincial and Dominion Governments for enforcing Prohibition.

A resolution was passed that the women should show appreciation of the Food Board and co-operate with it as much as possible.

Mrs. Martha Harvey of Fredericton then moved a resolution that a Dominion as well as a Provincial organ be authorized.

This caused much discussion among the various delegates.

After the singing of the National Anthem the Convention adjourned for another year, the place of meeting to be announced later.

During the Convention it was announced that the Maritime Farmer was now the Official Organ chosen by the Department for our New Brunswick Women's Institutes.

After the session closed the members were all invited to the Experimental Farm to inspect the building and grounds, and also to go through the new convalescent home, which proved very interesting to all.

The Sixth Annual Convention of Women's Institutes is over but we are confident that each delegate has returned home with fresh inspiration and a more firm determination than ever to live up to Kitchener's last signal message to "Carry On."

LIMING FOR CLOVER

In bulletin No. 213 of the Indiana Experiment Station, the following summary is made concerning the value of lime for growing clover:

Clover will not thrive on acid soils.

Liming is the only practical means of correcting soil acidity.

Three-fourths of the soils are acid and in need of liming.

About one-fourth of our soils is so very acid that clover fails almost every time ti is sown.

Aout one-half of our soils is of slight to medium acidity and clover will fail whenever the weather conditions are at all unfavorable.

Only about one-fourth of the soils is well enough supplied with lime to enable clover to develop properly.

A liberal application of pulverized limestone or some other form of lime is needed to insure a clover crop on any acid soil.

Wherever clover fails to thrive, the soil should be treated for acidity.

If the soil is acid enough to need liming at all, at least two tons per acre of ground limestone or its equivalent in other forms of lime should be applied.

Ground limestone may be applied at any time, but the best plan is to apply it on plowed ground and disk it into the surface soil.

Lime will often produce immediate increases in grain and other crops, but the greatest benefit derived from it comes through increasing clover and other legumes in the rotation.

Following a good clover crop, it is possible to grow good grain or other crops.

The greater the proportion of legumes that can be turned under, either directly or in the form of manure, the easier it will be to maintain the fertility of the soil.

Lime is not a fertilizer. Manure or fertilizer, or both, should be used in addition to lime.

On seven experiment fields in different parts of the state, ground limestone has produced crop increases worth from $10.50 to $67.70 per acre per rotation of corn, wheat, and clover. The average net profit has been $6.78 per acre per year, and $2.68 per dollar invested.

BIG LIVE STOCK CONSIGNMENT SALE

Will be held at Fredericton, Thursday, November 7th. Many Animals will be offered. Poutlry, too.

The New Brunswick Department of Agriculture has arranged for a big Breeders' Consignment Sale of horses, Shorthorns, Ayrshires, Holsteins, sheep, pigs and poultry, to be held at the exhibition grounds at Fredericton, on Thursday, Nov. 7th. The sale will commence at 10 a. m. The idea is a new one, so far as this province is concerned. It will bring together the best animals to be found in the representative pure bred herds of the province. Horses, pigs, sheep and poultry, all stock from the leading dealers of the province, will also be offered. Among the breeders whose herds will be represnted are A. Snowball, Chatham; L. M. Anderson, Sackville; John A. Hughes, Petitcodiac; McIntyre Bros., Sussex; Dr. J. E. Hetherington, Cody's; Walter Allison, St. John; Harding Bros., Welsford; Fowler Bros., Welsford; Alphonso Kelly, Fredericton and H. C. Jewett, Fredericton. Nothing further need be said as to the quality of the stock that will be offered. The breeders ar known in every part of the Maritime Provinces and their animals have won many prizes in Maritime Fairs. The bidding will be genuine and the sale will be conducted by two competent auctioneers and will be managed by a ring committee of three, who will have absolute charge. There will be no by-bidding allowed. Already ninety animals have been entered for sale and this number will be increased before the date of sale. The stock will be open for inspection the day previous to the sale.

Inorder to reduce the cost of attending the sale, the department has arranged for one and one-third fares from all stations from which ten or more wish to attend the sale. Every effort should be made to arrange for parties of ten.

If the sale of 1918 is a success, it will be made an annual affair. The adoption of such sales should serve to encourage breeders and at the same time give the public an excellent opportunity to get good stock.

Don't forget the date, Thursday. November 7th.

FERTILIZER FUTURITIES

The crop fertilized never consumes all the plant food given. The soil always and invariably holds part back for future crops, as every observing farmer knows who has seen the spots of larger growth in the small grains or grasses which have followed a hill-fertilized crop of corn.

Fertility tests conducted at the Ohio Experiment Station illustrate this point. For instance, in the five-year rotation on the home farm at Wooster, one plot is fertilized only on the wheat crop, and the wheat has given a 20-year average increase for the treatment of 13.72 bushels per acre. The clover following the wheat has been increased by 588 pounds, the timothy following the clover by 210 pounds, the corn following the timothy by 7.44 bushels, and the oats following the corn by 3.64 bushels. In other words, 60 per cent of the value of the total increase has been found in the crop receiving the fertilizer, and 40 per cent in the four crops which ate at the second ,third, fourth and fifth tables.

MENDING WITH WIRE

In mending with wire it is important that the last round be not twisted too tight or it will bear most of the strain and break under service. A better plan is, if mending a chain for instance, to run the ends around the side of a link in opposite directions and twist down against it.

In lacing a belt you usually tuck the ends away until they bear no strain. Yet belt lacing will adjust itself much better than fence or baling wire. But if it is wire lacing you must still eb careful not to get too much strain on the last strand. Twisting wire is always a tightening action such as you desire when you make a hose clamp of it.

HOUSING BINDER AFTER HARVEST

Now that you are through with the binders fo rthe season, be sure that they are not left in the field, but are put away in proper shape. The binder canvases should be cleaned, broken slats and straps noted, and spread out in the sun so as to eb sure they are thoroughly dry, then rolled into compact bundle and hung from the roof or a joist by wire, so that mice and rats cannot get to them. The sicklebar, after having been removed, should be placed in the wooden guard in which it was shipped and hung on the wall out of the reach of children and livestock. All bearings should be oiled with a heavy oil, and the broken part or parts needing attention before next season's use should be noted on a card, which should either be fastened to the binder seat or hung in a particular place in the repair shed. The binder should then be placed in a good dry shed where it will not be exposed to rain or sun or drifting snow, nor where it will serve as a chicken roost.

FRANK F. JOSLIN APPRECIATES THE MARITIME FARMER

Writes under date of October 5th, 1918. "Your paper is getting better all the time. I might add that I have purchased several head of pure bred stock from your advertisers."

Mr. Joslin also includes the name of a new subscriber to "The Maritime Farmer" which expresses in a very tangible way his appreciation of this paper. His letter should furnish a hint to live stock men who do not advertise in "The Maritime Farmer".

HORTICULTURE

SELECTION AND WINTERING OF BIENNIAL VEGETABLES FOR SEED

By the term "biennial" vegetable is meant one which takes two seasons to produce seed. The vegetable must be stored over the first winter and replanted, for seed production, the following spring. Some well-known vegetables of this class are beets, cabbage, carrots, celery, parsnips, salsify and turnips. Seed from these can easily be grown in Canada if the vegetables to be so used aer kept in good condition over the winter. Some information on the seelction and storing of roots and plants intended for seed production is herewith given.

Unless a rigid selection is made, each year, of specimens which are true to type it will not be long before a large proportion of the crop will be not true to type; hence great care should be taken to select well-shaped, medium-sized roots, typical of the variety of beets, carrots, parsnips, salsify and turnips, firm-headed cabbage true to type, firm stalked ad disease-resistant plants of celery, and firm, shapely onion bulbs. If this is done and varieties are kept far enough from others so that they will not cross the crop from Canadian grown seed should compare favourably with imported seed in regard to purity, as it does in other characteristics.

The methods of wintering vegetables for seed will vary in different parts of Canada but in most places it will be necessary to give them some protection. When possible, it is best to store them in a frost-proof cellar. But, if necessary, the vegetables mal be stored outside, both in small and in large quantities, except in the case of onions, which must be kept dry, and stored in a cool place where there is little or no frost.

Cabbage.—One of the simplest and successful methods of wintering cabbage at Ottawa has been to place the plants side by side, heads up, in a trench or pit, the heads aout six inches below the level of the ground, the trench being refilled with soil to the bottom of the heads. About a foot of straw is placed over the heads and, when cold weather sets in, from six to eight inches of soil is put over the straw. Foerst leaves, no doubt, would prove as satisfactory as straw. When winters are not very severe or where a heavy covering of snow is fairly sure, the cabbage may be simply heeled in with heads above ground and the latter covered with leaves or straw just before severe frosts. There should be only a light covering at first to help prevent heating and rotting, and later a heavier application when the weather becomes cold.

Celery.—Good results have been obtained at Ottawa by wintering celery for seed purposes as follows: The plants are set in a trench deep enough so that the tops of the celery come even with the surface of the ground. The plants are set close together in the row, but each row is separated by soil. Before severe frosts, the plants are covered with a heavy layer of straw and when cold weather sets in with about fifteen inches of soil. In 1917 nearly every plant came through the winter with the heart in good condition, which is all that is necessary to ensure good crops of seed.

Beets, Carrots, Parsnips, Salsify and Turnips.—When harvesting, the tops are cut to within two inches of the end of the specimen, thus leaving the central shoot. This is better than cutting off the leaves close to the root. The pit in which good success has been obtained in wintering roots at Ottawa is made as follows: A hole is dug of the necessary dimensions, six inches deep, in a well-drained place. Poles are laid on the ground and covered with boards, leaving about five inches of air space under the flooring. A sink hole three feet deep is dug six feet away from the pit. An inverted trough-shaped pipe connecting this hole with the air space under the pit gives a chance for air circulation and drainage of any water that might soak in. The roots are put in bags to seperate them better, though his is not always necessary, and piled three tiers high, running to a peak. A peaked roof of boards is put over the pit, high enough above the bags to allow about fifteen inches of straw to be packed in between; over the roof is put a light coat of straw and the fifteen inches of soil. A vent hole nine inches square is left in the centre of the roof. Before hard frost the sink hole is filled with straw and covered with boards and twelve inches of soil. The covering with soil should be deferred until cold weather sets in to avoid danger of heating, and during the winter the temperature inside the pits should be taken if the pits are large. In many places parsnips may be left in the ground over winter and transplanted in the spring when better results will be obtained than if pitted, as they are very hardy.

THE STORAGE OF POTATOES

The losses from improper storage of potatoes are of far greater economic importance than is generally realized. These losses are brought about by a variety of factors which may be grouped in three divisions, e. g. Physical, Mechanical and Pathological.

The chief loss from physical factors is brought about by the storage of immature stock. Potatoes that are to be stored should be thoroughly ripe, that is, the stalks should be dead, and the tubers should adhere firmly to the stems. Potatoes may have their stalks prematurely killed so as to resemble a natural death by being attacked by late or early blight, rhizoctonia, the flea beetle or potato bug, but upon examination the tubers under such plants will be found immature and unfit for best storage results. Frost bitten and sunburned to also come in this division.

The mechanical factors that bring about loss in storage are chiefly brought aout by careless handling of the crop at harvest time, such as broken, cracked or chipped tubers due to improper digging and rough usage in gathering the crop. The slightest injury to the skin of the potato lays it open to invasion of myriads of decay producing spores, which, when given the proper conditions will rapidly spread decay through the entire lot.

Under the pathological factors come the tubers affected by disease. Undoubtedly the late blight (Phytophthora infestans) is the most common, as well as the most destructive. Tubers affected by this disease are almost certain to decay in storage; nor is this decay confined to the diseased tubers, but spreads rapidly to the healthy ones, unless preventive measures are employed, and perfect storage provided.

The decay of potatoes in storage may be caused by a number of organisms, while each organism may have its own particular form of attack; still it is gratifying to know that the remedial measures are the same in each case.

The following suggestions regarding the storage of potatoes, if followed carefully, will practically eliminate the losses from decay of potatoes in storage.

1. Spray your potatoes frequently and carefully during the summer with Bordeaux mixture.

2. Delay digging your potatoes, if possible, until the tops are dead and dry.

3. Avoid covering potatoes, after they are dug, wtih the tops, to protect them from sun or frost.

4. Carefully examine all potatoes to be stored, and remove immature, broken, cracked, chipped, sun-bitten, frost-bitten or diseased tubers.

5. Never store your potatoes while wet.

6. Have the tubers free from dirt. If dirty, the soil fills up the spaces between the tubers and prevents the circulation of air.

7. Provide a dry cellar with abundant ventilation, where the temperature can be between 34° and 40° F.

8. Keep the storage room as cool as possible directly after the product is stored.

9. Fill your bins gradually; by so doing, the potatoes that are put in first have lost their heat before they are covered by another layer.

10. Carefully sort your stored potatoes at intervals during storage, and remove all tubers showing signs of disease or decay.

PREPARE YOUR BEES FOR WINTER NOW

Upon every owner of bees develops at present a national duty:—to do his best to keep them alive until they can again add to our depleted supply of sweets. More than half the battle is to provide them with good protection during cold weather. If you have not a dry, deep, cool cellar, try to get a friend who has one to let you put your bees in a dark corner there. Do not put weak colonies away for the winter; they consume more stores, so valuable now, than strong ones, and even then are more likely to die. Unite them now while the weather is still mild, and see that each colony has aout 30 pounds of wholesome stores to tide it over until well on in spring. Do not delay. Uniting and feeding cannot be satisfactorily done when cold weather is upon us. If your apiary is sheltered from wind, another good way to winter strong colonies of bees, suitable for southern Canada, is to pack the ihves in shavings or dried leaves in a large case. Do not forget to provide a small flight hole in the case.

Honey has doubled in value since twelve months ago, and so have every hive of bees. There was a heavy loss of bees last winter, mostly through neglect to prepare them wtih care and in good time, and it has been impossible to meet the great demand for bees during the summer.

POTATO SEED SELECTION

Like begets like in the potato field as elsewhere, but judging by the quantities of inferior tubers used for seed purposes, the importance of this law is not appreciated by many. The use of small potatoes taken from the bulk of the crop, year after year, and used for seed will eventually lead to yields of inferior potatoes.

At potato digging time the great opportunity for seed selection is offered. With the product of each plant spread on the soil it is an easy matter to select out those plants that have given the largest yield of the most desirable type of potato and are free from disease. The potatoes from such plants only should be gathered and saved for use as seed the following year. This saving of seed at digging time may seem to many as an extra burden during a rush of work, but it is not.

There is less actual labour attached to seed selection at the time of the potato harvest than there is by practising any other method of seed selection. Furthermore, the results from hill selection are reasonably certain while with other methods there is some speculation. Potato growers would do well to watch closely for exceptionally good plants. These, harvested and saved apart from the main crop, may become the grand-dads of fine potato fields in the future.

APPLELESS TREES MUST BE PRUNED

W. K.—(1) Apple trees have plenty blossoms every year, but never any apples form. Will spraying make the apples form.

(2) Could you also tell me what to do for rose bushes that are alive with green fly insects?

(1) Apple trees that annually show lots of bloom and no fruit, are not readily cured by spraying. What they want more is a severe pruning of branches and roots, the latter so that they keep well towards the surface. Deep rooting and luxuriant growth of branches is against fruiting.

(2) Strong solution of whale oil soap or solutions of tobacco are the best materials to kill insects, but it must be applied with sufficient force to penetrate the waxy covering of their bodies. Kerosene emulsion is also a sure cure, but you must make it so weak that it will not damage the plant. Try it on other plants to test the strength. In spraying the whale oil soap solution, have the solution hot. When applying it with force pump lay plants on the ground.

FERTILIZERS FOR 1919

Now is the time for the farmer to plan his croppings for 1919, and in doing so to decide upon what fertilizers, if any, he purposes to use. Last spring there was considerable disappointment among farmers, especially among those who had delayed placing their orders till a few weeks before the season opened, as there was not only a shortage of material but transportation facilities were such that quick deliveries could not be made. There is no prospect that conditions will be better next spring and it therefore behooves the farmer this fall to carefully consider his needs, scan the prices and having made his selection to place his orders, stipulating an early delivery. Co-operation in ordering may effect the saving of a considerable amount in purchasing and freight rates.

During the last ten years there has been considerable increase in the number of farmers in British Columbia, Quebec, Ontario and the Maritime Provinces using fertilizers, but unfortunately but a small percentage of them have any definite knowledge of the profit that may have resulted from their application. There will always be a degree of uncertainty as regards results from fertilizers, chiefly owing to the fact that seasonal conditions can not be predicted, but with close observation from carefully planned work, a very great knowledge may be gained as to the kind and amount of fertilizer which will prove profitable. A series of adjacent plots on fairly uniform soil, each with a different amount or combination of fertilizer and sown to the same crop, furnishes the most reliable means of learning the most profitable application, but if time and labour do not permit of the adoption of this plan, a strip of the field, well staked, should be left unfertilized, and its yield weighed against that of a similar sized strip on the fertilized area. From the results so obtained the profit or loss from the application of the fertilizer may be readily obtained.

A considerable saving may be usually effected by buying fertilizer ingredients—nitrate of soda, sulphate of ammonia, superphosphate, basic slag, etc., and this course also furnishes valuable information for future guidance obtainable in no other way.

Information and advice regarding the use of fertilizers will be gladly given as far as may be practicable, by the Division of Chemistry, Central Experimental Farm, Ottawa.

ATTENTION TO PLANT DISEASES AFTER HARVEST

The plant pathologists of the Experimental Farms inform us that of the many destructive plant diseases, none are more difficult to control than those living over in the soil. Year after year, notwithstanding the practice of crop rotation, the effects of soil infection often became so pronounced as to cause what is popularly known as "soil sickness." One of the most notorious

IN BUYING WESTERN LAND you can be sure of fair dealing and reliable information if you make your enquiries through

WINNIPEG, REGINA, CALGARY.

of these diseases is clover and alfalfa wilt (Sclerotinio) which has given rise to the belief that land may become clover sick. This disease has just begun to show up on the Continent of America, and unless prompt precautionary measures are taken there is a possibility of the disease causing similar losses here to what it does in Europe.

A disease similar in nature attacks beans, and there are other instances which call for a word of general advice on matters of prevention.

As soon as crops are harvested, whether gathered in tne field, garden or orchard, there is manifested a universay indifference and neglect on the part of some growers towards the condition in which the ground, trees or bushes are left. Were it but known to them that with the refuse letf on the ground from crops there exist myriads of germs of serious plant diseases (and also insect pests) ready for hibernation!

Mummied fruits in orchards left undisturbed, either on the trees or on the ground, give rise to a new outbreak of brown rot in spring. Plowing under affords only limited protection, since it safely buries all fungus material which spring plowing will bring to the surface of the soil once more after successful hibernation. Prevention, as usual, is decidedly better than cure, and sanitary measures are just as important in field, garden or orchard as in stables and dwellings. As soon as possible after the harvest of each crop—or better, after the growing season is over—a general clean-up is most essential. Where possible, all refuse should be collected; diseased or rotten fruits, leaves, stalks, haulms, etc., should be gathered and the whole destroyed by fire. Material that will not burn readily, such as is common on the fields after harvesting—roots, potatoes, etc.—should be buried in a pit. In orchards, where such measures are followed by the usual dormant sprays, the results will be most beneficial, and field and garden crops will also greatly benefit.

French Canadian Colts for Sale

French Canadian Colts are for sale at very reasonable prices by the Experimental Station, Cape Rouge, Que., from the largest stud in existence today. If you require a wiry, sturdy, tough breed of horses, write

CAPE ROUGE - - QUE.

WHAT THE VICTORY LOAN MEANS TO CANADA

What the 1918 Victory Loan means to Canada can best be realized by a knowledge of what the 1917 Loan made possible. The subscribing of over $400,000,000 by the people of Canada last year enabled the Dominion Government not only to take care of the needs of the Army, but also to make substantial advances to various industries which has resulted in unprecendented prosperity.

Since the beginning of the present year Canada's war expenditure has been averaging over $30,000,000. a month. It has grown heavier as the army overseas has increased in number, and especially since the beginning of the great Allied offensive early in August. To date about 590,000 men have been enrolled in the Expeditionary Force, the number that has gone overseas being fully 415.000. Today there are 60,000 more Canadians overseas than there were at the end of 1917. All this means heavier war bills and the greater need for the next Victory Loan.

Canadians hardly realize what a strong impetus the large subscription to the last Vcitory Loan imparted to business. It enabled the Government to make advances to industries which, without the $400,000,000 subscribed, would have been impossible. Great Britain wanted our beef, bacon, cheese, wheat, hay, oats and munitions, but she could not pay cash for them. Canada could not borrow abroad the money she wanted, so if she were to sell he rsurplus products she had to give credits to Britain and advance the money for the purhcases.

During the present year the Imperial Munitions Board has received from tne Dominion Government advances amounting to $25,000,000 a month. By an advance of $10,000.000 made by the Government the Board was able to give orders for the building of 44 wooden ships. Another advance of $1,000,000 enabled the Board to begin the manufacture of aeroplanes, of which 3,000 have been produced in one of the Board's great plants.

The 1917 Victory Loan made possible the advancing of $100,000,000 to finance the 1917 wheat crop. Another $100,000,000 was similarly advanced to finance the sale of our exportable surplus of beef and pork products to Great Britain. In addition, large sales of hay and oats were also provided for.

A larger war loan is needed this year than last, because the 1918 war expenditure will probably be from $50,000,000 to $75,000,000 larger than in 1918. The Imperial Munitions Board will, if anything, require larger advances during the coming year than it has had, for its operations have been greatly extended.

The Dominion Government has also announced a $50,000,000 shipbuilding programme.

The Government must finance the sale of the Western wheat crop to Great Britain, which will probably require over $100,000,000. The advances for the sale of beef and pork products wil ltake another $100,000,000; cheese, butter, eggs and hay over $50,000,000 and the sale of the surplus B. C. Salmon pack $10,000,000.

CABBAGE BURSTING EASILY PREVENTED

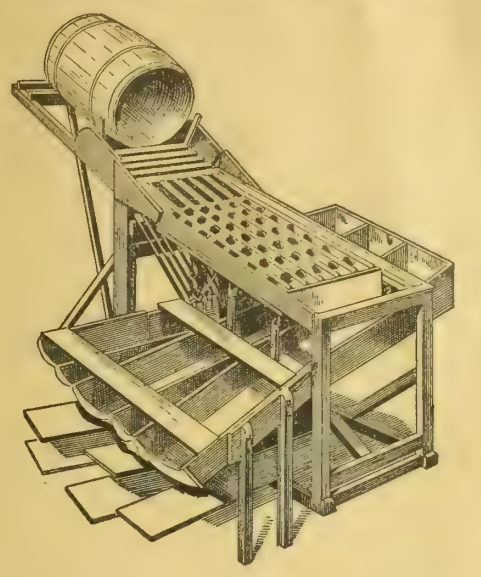
Is there anything can be done to keep cabbage from bursting.—J. B.

If the autumn is damp and the late cabbage is inclined to burst, you may do much good by going through the patch and carefully selecting those heads most apt to burst and pulling the roots partly out of the soil, so the heads lean somewhat to one side.

This breaks off some roots, but leaves enough to sustain life. There will not be so much growth, however, and not so much moisture will come up from the roots to the centre of the head, which is the cause of bursting.

In large fields of cabbage, hundreds of dollars can be saved by doing this.

The Elderkin Fruit Sizer and Grader



To grade your apples quickly, cheaply and in the best possible manner, you require an ELDERKING GRADER, the best on the market, with help so scarce, why not buy a grader at once and get the biggest price going for ycur fruit.

For Prices and full information write the

Hantsport Fruit Basket Co., Ltd.,
Hantsport, N. S.

A small garden can be watched very easily and much loss prevented.

PREPARE TO PLANT TREES

Spring is the season when tree planting is best done and when one is prompted to think about the advantages of having a few trees around the front door yard. But now is the time to begin. The soil should be plowed in the fall, if not earlier, for tree planting. Prepare the soil for storing as much of the fall and winter moisture as possible. Arrange to give the trees considerable room, possibly a rod between trees, and give your order for trees early. Nurserymen will be glad to receive your order now for spring shipment. You will be sure, if this is done, to receive the species you desire and to receive them in season.

AUTUMN CULTIVATION FOR THE CONTROL OF WEEDS

The ploughing of the land in the fall is desirable as a part of the regular work of the farm, since it enables the ground to be got into proper condition for sowing the seed in spring considerably earlier than would otherwise be the case. But it is perhaps of even greater importance as a means of keeping weeds in check. In the case of perennial weeds the mere turning up and exposing of the root stocks to the action of the frost will serve as a considerable check to the weeds in cases where they are not killed outright. Where it is desirable to collect and burn creeping root stocks this can be more readily accomplished where the ground has been pulverized by the frost and snow in winter.

In the case of annual weeds these are of two classes from the point of view of their life-history. One group requires a resting period before the seeds will germinate and this holds good even if the conditions with regards to moisture and temperature are suitable. These normally germinate in the spring of the following year after they are shed, but in many species the germination can be delayed for several years if the seeds are buried to a considerable depth in the soil. This is true of such species as wild oats and wild mustard. Each time the surface of the ground is disturbed some of these buried seeds will germinate and if no other seeds are allowed to fall into the soil in the meantime, the ground will eventually become clear of them.

In another group o fannual spesies known as winter annuals, the seeds germinate immediately after they are scattered and pass the winter in the form of a small seedling plant which survives under the snow and resumes growth in the following spring. Belonging to this group are the following weeds:—Chess, purple cockle, nightflowering catchfly, stinkweed, shepherd's purse, false flax, ball mustard, wild mustard, hare's ear mustard, tumbling mustard, peppergrass, wormseed mustard, corn gromwell, blue bur or stickweed, and stinking mayweed. It is in the case of these weeds that autumn cultivation is specially desirable as if they are turned under with the plow and covered sufficiently deeply, very few of them will be able to continue their growth after the snow melts.

INCREASE MILK PRODUCTION BY PROVIDING YOUR HERD WITH PROPER FEED AND CARE

Right now wonderful lessons about feeding and caring for cows for large and economic production are to be learned. Even the most unobserving one realizes that his cows are milking more largely today than they did a couple of months ago. Those who weigh their milk know how great the increase is. Those who test the milk from each cow every month know also that the milk is not only more yellow, but in most instances it is richer. Moreover it is very evident that cows are gaining rapidly in condition and that they are enjoying real cow comforts.

It is a busy time of the year and labor is scarce, we grant, but in spite of this we do not hesitate to say that the best possible manner in which any man who milks cows can spend a few hours is to go to his pasture, sit down under the shade of a tree and study out the reason why his cows are giving more and richer milk, lactation period considered, than they do at any other season of the year. If he will but see and think he will learn the greatest lessons that are to be known about feeding and caring for cows. He will become impressed with the fact that of all teachers, including Experience, Nature is the greatest. In most climes she teaches her best lessons during the month of June. In the words of James Russell Lowell, it is then that she "tries earth if it be in tune and o'er it softly her warm ear lays."

Five great fundamental principles of feed, care and management Nature employs in June to perform her miracles, says Prof. Hugh G. Van Pelt, in Kimball's Dairy Farmer. These are not secrets. They will be clearly apparent to anyone who will comfortably seat himself and watch the cows graze in the valleys and along the hillsides.

Comfort—that is the first fundamental. The air is balmy, neither too warm nor too cold. The sunshine, not yet extreme, is invigorating. Flies and insects have not yet become numerous enough to torment. Unannoyed by depressing heat excessive cold or pests, each cow works persistently with great enjoyment.

Fresh air—that is the second essential. Each cow is thoroughly surrounded with all the fresh, pure, oxygen-laden air she can possibly breathe. With nostrils distended she takes into her lungs the elements so necessary for purifying her blood and for insuring the best of health and the most thorough digestio nand assimilation of her food.

Sunshine—that is the third essential. There is vitality in the rays of the sun and, of all germ destroyers, direct sunshine is the greatest. Without sunshine, animal life would not last long; and after cows have been all too often housed in dark, gloomy barns all winter, it is doubtful if any one phase of Nature's aids is more helpful than the glorious sunshine in June.

Water—that is the fourth fundamental. Very often during the day each cow may be seen leaving the herd to go to the brook and drink of the clean, clear, sparkling water from which the rays of the sun have removed the icy chill that made her shiver every time she took a drink last winter. She loves this pure water that is neither too warm nor too cold and she drinks abundantly of it.

Feed—that is the fifth great essential, and the final one. Each cow is veritably surrounded with an abundance of feed that is green, fresh, succulent, palatable, well balanced and easily digested. In all her comfort and glory, enjoying the pleasant air and sunshine and pure water, the cow eats all she can, digesting it quickly, putting it largely in her udder in the shape of milk-making nutrients—and then she eats some more. All day long during the entire 24 hours she works unhindered, unmolested, for her master and for the great principle of making the wonder food which has made Canada famous.

Soon July will be here and then August, and with these months will come flies, mosquitoes and insects, the sun will be unbearabl yhot, the water in the brook will be unpalatably warm and the pasture grasses, eaten close, will become dry, dusty and unpalatable. Quite naturally milk production will decerase and the richness of it will wane. What a great contrast of conditions will prevail. Not again until next May and June will Nature seemingly try to do otherwise than to place obstacles in the pathway of both man and cow. In her own way she makes impressive the fact that during June, day after day, she held open school and taught every man who would see and think how best to care for his cows. She even went so far as to demonstrate all of the great fundamental principles of how to care for and feed and manage cows. As far as she is concerned, it is for man to look out for himself, and for the artificial cows he has made, during the remainder of the year.

If he would have green, succulent, palatable, easily digested, nutritious feeds, he should raise soiling crops. If his cows are not to be pestered with flies and mosquitoes he must kill the pests or spray his cows with materials that will protect them. If the milk flow is not to be impaired by the excessive heat from the sun, shade in the form of darkened, vell ventilated sheds or barns can be provided. Nature has shown what to do but, except in May and June, man must do it.

For a short time during the fall months Nature is lenient and then, as winter comes on, she sets about to do her best to compel man to do that which she has taught him to do during the balmy days of June.

She insists that he build barns and store up feed for the winter months. She insists that, if he is to keep his cows in good health and condition, he must furnish the same fundamentals that she furnished in June. This is not difficult to do for the one who sees and thinks. He can easily equip his barn, so it is convenient and comfortable, neither too warm nor too cold. He can ventilate it so as to permit the fresh air to gain access without drafts and compel the foul air to leave. He can have windows in his barn that admit the sunshine. He can have a water basin in front of every cow, provided his barn is as warm as it should be, and to these basins the water will come as fresh and clean and pure and always be as available as are the brooks in June-time. These things cost very little. They are more the result of intelligent thinking and well planned action than they are results of expense, and what little they do cost is chargeable to permanent improvements and paid for many times by additional production.

Expensive as feeds now are, it will cost less—by building and filling silos and growing legumes like clover and alfalfa—to provide for the cow the same sort of succulent, palatable, easily digested, nutritious food in abundance than to fail through procrastination to do so.

Wise indeed is the man that milks cows, who will take a few hours from his work, go to his pastures where the cows graze, visit with Nature, learn the valuable lessons she teaches, and provide at once for applying the great fundamental principles of large, economical, profitable milk production.

TREATING AFFECTED TEATS

When a cow doesn't yield her milk in a proper manner, gives bloody milk, etc., the trouble can often be found in some disorder of the teats. In fact, it would be hard to find a dairy herd in which at least one member of the herd is not more or less affected with either leaky teats, blocked teats, sore teats or warts on the teats.

Milk leaking from the teats may occur when a cow is milking heavily and the periods between milkings are not evenly divided, or it may be because the sphinter muscle is not properly performing its duties. As there is no remedy for this trouble about the only thing that can be done in case conditions warrant is to place a rubber band around the lower part of the teat.

Warts on the teats do not as a general thing cause much trouble at first but after they are well developed they tend to make the teat tender to handle, besides adding to the danger of increasing the possibility of contaminating the milk through infectious material which may be found upon them. The best way I know of to get rid of warts is to tie a piece of waxed silk tightly around the wart as close to the teat as possible. After a few days the wart will drop off and cause no more trouble. For the warts that are too small to tie around with silk, an easy way of removing them is to touch them with a feather dipped in butter of antimony. This is very strong and care should be taken not to touch the teat at all with it. Olive oil is also good in removing warts. They are smeared thickly with the pure olive oil, several applications usually being necessary.

Sore teats are a difficult proposition as the process of milking opens the sores and we can't allow a cow in full milk flow to lay off for a week or so to enable he rteats to heal up. Sore teats are often caused by milking with wet hands, the teats being left wet after milking and when the cows are turned out into the lot or pasture the wind chaps and cuts the teats. Those who practice wet-hand milking, which practice I do not support, should be sure to thoroughly dry the teats with a soft cloth after milking is completed.

Here is a way of treating sore teats that I have tried and found very successful. To one ounce of glycerine add one dram of boracic acid. Mix this in one-half pint of water and put in a narrow jam jar. After milking is completed put the teat in this mixture, holding the jar close up to the cow's udder, and let the affected teat soak therein for a few minutes. This mixture may be kept and used again and again. A little touch with a crystal of alum after this bath will help the more obstinate sores to heal more quickly but care must be exercised not to apply anything that will cause the skin of the teat to wrinkle and pucker up when the sores heal. Oxide of zinc ointment applied after each milking is also good remedy for sore teats.

Blocked teats are always a bother as they interfere with the flow of milk and moreover make is very hard to strip the quarter clean. They are caused by a little ball of flesh inside. In nature these growths are very like the warts on the outside of the teats. Some are only attached to the lining of the skin by a little string, and can be pushed out of the way by the insertion of a teat syphon. Sometimes they break off and come away of their own accord. I have seen the more obstinate ones removed by the use of a large sized milk syphon, with one side filed to a sharp edge, in exactly the same manner as an apple is cored with a patent corer.

The syphon is held in the right hand and the teat held in the left. After the syphon is introduced into the teat it is slowly turned around with the sharp edge against the lump. It is a simple little operation and yet it is easy to lose the quarter in performing it. The syphon must be sterilized in boiling water before being inserted and every precaution should be taken to insure absolute cleanliness. There will be a little blood come from the teat and this should be milked out and the teat syringed out with a seven per cent. mixture of boracic acid and warm water. The lining of the teat will soon heal, so long as it is kept free from germs. This can only be done by keeping everything perfectly clean. No one but a competent operator should attempt to cut away these lumps in teats, otherwise more harm is apt to result than good accomplished.W. H.

BISHOPRIC AND THE FARMER

BISHOPRIC products mean more than sound, substantial, durable buildings. They mean building material that you can handle yourself at a saving of from 25% to 50% over sheathing, lumber, metal lath, and lath and plaster—and give you a warmer, drier and better building.

BISHOPRIC STUCCO BOARD

is the cheapest and best background for stucco for outside walls, and for plaster for inside walls.
The thick layer of asphalt mastic prevents dampness; the stucco or plaster is held by the dove-tailed lath, while the sized sulphide fibre board holds the material firmly together, and is a non-conductor of heat and cold.
For interior work, when plaster is not desired

BISHOPRIC STUCCO BOARD

should be used, applied with the lath to the studding and the sized fibre board ready for any class of decoration, exposed.
It is easily and quickly applied without creating muss and dirt, saving lath and plaster, and about 50% of the labor cost.
If you are building or intend to remodel the house or barn, write us for descriptive and illustrated booklets, telling in detail the facts about Bishopric products. 87

SOME COWS SPENDING MONEY EVERY DAY INSTEAD OF MAKING SOME FOR OWNER

To the writer the future of the dairy industry seems more hopeful than to some others with whom he has talked. I am satisfied that in the first place, we must cull out our poor cows and send them to the block, because if there to to be any profits in dairying they will be small for some time and the poor cow will spend our money every day instead of making money for us.

With an effort all along the line to get rid of the poor cows the demand for feed stuffs will lessen and prices will be held in check to some extent. With the poor cows slaughtered, the supply of milk and butter will fall off and prices will gradually improve.

But, says the man in the city, what is to become of the consumer? Milk is the cheapest food on the market today. It is strange that the people in the cities do not comprehend the truth. Oleomargarine may be used by grown-ups as a substitute for butter, but it is not a substitute for butter in the ration of the child and never can be. Prices of dairy products seem high to the consumer, but they must go higher or these products cannot be furnished.

Gradually to a considerable extent, dairy products must take the place of

meat. I am convinced that as a people we shall have to eat less and less meat until the close of the war. This will be necessary for two reasons. First, the production of meats must gradually fall off unless prices are considerably advanced, and second, large quantities of the grains essential in their production will have to be used directly as human food. The falling off in production and the consequent rise in prices will enable the farmer to produce both meat and dairy products at a small profit though in less quantity than before.

Keeping less live stock on the farm and devoting a larger acreage to the growing of grains, he will answer the nation's call for increased food production, in which capacity he is just as important a factor in winning the war as the manufacturer of munitions. By seeding liberally to clover, by making the best use of the manure resulting from even the smaller amount of live stock kept on the farm, by mowing the clover but one year and then plowing it under, he should reap a profit from the growing of grains sufficient to compensate him for the somewhat smaller returns from the live stock.

So in conclusion, I would get rid of every poor cow as soon as I could find her. I would breed the good ones to the best sire possible even though I had to drive for miles and pay a liberal service fee. I would feed thoughtfully, intelligently and carefully. If I knew of another man anywhere whose success in feeding was better than my own I would see him at once and learn why. It is more important that we dairyman should succeed now than in the past, for we are a part of our great national army. We are not in uniform but we are soldiers of agriculture, and upon the way in which we "do our bit" will depend in some degree the outcome of this great world's struggle.

MANGE IN COW

Dairyman:—I have a cow four years old. There was a yellow dandruff started at the tail and is running down t othe udder and along one side of the hip bone. It ets dry and come off in big scales and brings the hair with it.

Ans: This is a species of mange but not as bad or difficult to treat as some other kinds.

Give 1½ or 2 pounds of Epsom salts and afterwards the following:

Nitrate of Potash.....¼ lb.
Sulphur .....¼ lb.
Ground Gentian Root.....¼ lb.

Mix thoroughly and give a teaspoonful every night and morning in the feed.

In addition to the above pour one quart of rain water on two ounces of creolin previously placed in a small pail. Keep the creolin at one side of the vessel and pour the water on quickly so that it will mix thoroughly. With this mixture wash the animal thoroughly all over the body and around stall, etc., and keep her away from other cattle. Zenoleum may be used instead of creolin if desired. It is put up in tins with directions on outside.

SELECTING THE WELL-BALANCED RATION FOR COW

In determining the concentrates to use in a grain mixture for dairy cows, several things should be kept in mind. The following factors are especially worthy of being considered:

Palataiblity

A feed is said to be palatable when its flavor is pleasing. Certain feeds, like corn, are palatable, while certain feeds, like cottonseed meal, are unpalatable until the cow has been taught to eat them. Unpalatable feeds should be mixed with palatable feeds. There is some proof that the amount of digestive juices excreted depends upon the palatability of the feed.

Bulk

A grain mixture is said to have bulk when a definite weight takes up a relatively large space. To illustrate, 100 pounds of wheat bran will occupy much more space than 100 pounds of corn meal, hence is said to be bulky or light. It is believed by dairymen that this bulk in itself enables the digestive juices to more completely penetrate the mass, and hence may facilitate digestion. At any rate, it is known that a dairy cow, to do well, must have the digestive tract well extended, and where heavy grain feeding is practised some of the benefit of bulk ordinarily secured in the roughage can probably well come in the grain mixture. Unless the grain mixture is fed on the silage, or other roughage, it is well that it have bulk in itself.

Variety.

In compounding a grain mixture so that it will have palatability and bulk and be properly balanced, generally three or four grains are used in the mixture. This is commonly spoken of as variety in the grain mixture. From recent investigations it would seem well that care should be taken to see that grains of distinctly different species of plants should be used. This will help furnish the animal with needed ash ingredients and special forms of protein required by a cow in milk. It is not variety simply to feed several different named feeds all coming from the same plant, such as corn stover, corn and cob meal, corn bran, gluten, corn distillers' grains, etc.

Effect on Health

Each feed has its own specific effect upon the animal body. We do not yet have the specific effect of all feeds, but certain effects of particular feeds are well understood. To illustrate, cotton-seed meal is known to be constipating in its effect, while linseed meal is known to have a laxative effect. Some of the roughages are laxative, such as silage, clover hay and alfalfa hay; some are constipating, such as timothy hay, oat straw and corn stover. When the roughages are constipating in their effect, a grain mixture of a laxative nature must be fed, if the dairy cow is to do her best. The bowels of a dairy cow should be in a laxative condition, if the cow is making her best production.

Cost

In successful farming, the business side is at least three-fifths. From the point of view of computing rations for dairy cows in order to produce milk, cost would not come in, but in actual farming it is more than half. Dairymen often believe that the cost price per ton is the most important consideration. It is important, but more important is the relative cost of net energy and digestible true protein in feeds. The farmer should calculate the cost of 100 therms of energy in all the feeds available, and then make the cheapest mixture that satisfies all his requirements.

Roughages Used

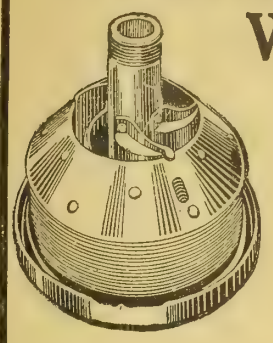
Concentrates are used to balance the roughages fed, and hence the nature of the concentrates will depend upon the roughages fed. It is easy to divide the roughages into three general groups.

Group 1 includes timothy hay, corn stover and corn silage. Any one, or any combination, of these will need a great deal of protein in the grain mixture.

Group 2 includes mixed clover and timothy hay, or any combination half leguminous and half non-leguminous. This group will require a grain mixture with a medium amount of protein.

Group 3 includes the legumes as the entire roughage. This group needs the smallest amount of protein in the grain mixture.—Pa. Ex. Sta. Bulletin.

The Exclusive Curved Wing Center-Piece



A FEW years ago the farmer bought a separator because it made a tremendous saving of butter fat over the old-fashioned pan skimming method.

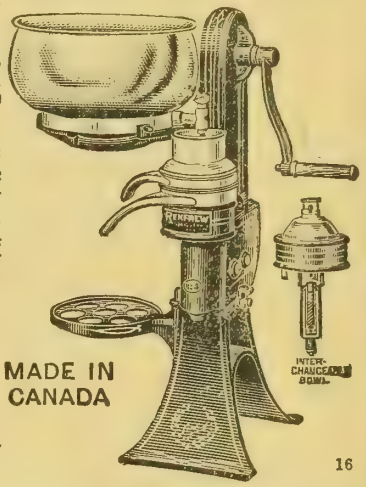
Nowadays farmers all over America are throwing out the old separators and getting the Renfrew because this up-to-date machine is almost as great an advance beyond the old separator as the early machines were ahead of pan skimming. The

Renfrew

is the only separator made that can give you the easy-to-clean, close-skimming advantages of the wide open bowl with curved wings.

The discs in the Renfrew are different in both size and shape. In the wide space between discs and the tubular shaft half the skimming is already done. The curved wings, providing a longer space for the milk to travel, increase the skimming force many times, and insure perfect and even distribution, and prevent clogging of the discs with cream. It is the easiest of chores to clean the Renfrew discs.

And remember this—there is no whipping of cream as with straight wings. Globules of fat are not broken. Thus you get *Quality* butter fat and a better cheque when you sell your cream.



Besides, you get *more* butter fat, more profits. The Renfrew gets all but 1/10 pound of butter fat in 1,000 lbs. of milk skimmed.

The Renfrew not only outskims others, it gets cream that makes the firmest and best of butter quality that other machines cannot produce.

The Renfrew catalogue describes the Renfrew's exclusive interchangeable capacity feature, automatic oiling system, enclosed gear and other advantages. Write for literature to-day.

LIVE STOCK.

KNOW THE STATE OF THY FLOCK

"Be thou diligent to know the state of thy flocks, and look well to thy herds" is a scriptural admonition, the observance of which crowns the stock breeder with success and the non-observance of which marks the operations of the negligent, to a greater or lesser degree, with failure, commensurate with the degree of carelessness exercised by the breeder.

Under present conditions there is no branch of the live stock industry that shows the profit on investment that is shown by sheep raising. It pays a farmer handsomely to be diligent to know the state of his flock. Every item of care given to the flock at this season is responded to in increased dividends by the arrival of the golden hoof.

The profit from the sheep flock comes from two sources, the wool crop and the lamb crop, to say nothing of the benefits accruing to the farm from their weed scaranging habits and the fertility added to soil where sheep are pastured.

The amount of dividends realized from the wool crop depends upon the care that is exercised in keeping the sheep during the winter, under conditions that will keep the fleece as free as possible of foreign matter, the proper feeding and attention to the general good health of the flock.

It is, however, to the lamb crop that the farmer looks for his biggest returns. The flock should average one lamb per ewe. Not a few farmers get a higher average by paying particular attention to some of the essential details recognized by successful sheep breeders the world over.

In order to get high percent lamb crops, it is necessary that the ewes be in prime condition and gaining weight at the breeding season. This desirable effect is procured by seeing to it that the ewes have access to an abundant supply of palatable food and water, and adequate shelter from the driving cold rainstorms, so often experienced in the Maritime Provinces during the late fall and early winter seasons, and that they be not harrassed by vermin or worried by dogs or other predatory animals.

So much for the ewe flock, but what of the ram, which is more than half the flock. What particular care does he receive? Our observations, as we travel through the various sections of the Maritime Provinces during the fall season, is that there is no animal on the farm that is so inhumanely treated as is the ram.

In order that the time of arrival of the little lambs may be controlled, it is necessary that the ram be seggregated from the ewes, or if left running with the flock, that he be banded to prevent copulation until the time when the farmer wishes to breed his ewes. While the banding system entails less labor, it is one that is not conducive to big returns, as the ram's vitality will be decreased by chasing and worrying after the ewes that come in heat, although, owing to the band he finds it impossible to couple with them. The vitality that should be conserved until the heavy breeding season arrived is thus sapped and a poor lamb crop is the result. Successful shepherds, particularly where the flocks are of fairly large proportions, disapprove of the plan of letting the ram run with the flock.

Referring to the inhuman treatment of the ram where seggregation is practiced, too frequently, usually early in September, the ram is taken from the flock and is chained in the open field where he is left unchanged to a fresh feeding ground and without water for several days, and subjected to the blazing rays of the sun and the cold, wet, fall rain storms without a shelter of any kind. What a change for the ram that roamed at will on the green, succulent pastures during the summer season, storing up strength and vitality! Starved to a certain extent, and subjected to all weather conditions, his vitality begins to ebb and the breeding season finds him emaciated and unfit to properly head the flock. The result, a lot of lambless ewes brought about by inefficient mating or by a high death rate among newly born lambs, due to low vitality, a heritage transmitted by the sire.

The way rams are frequently treated during the period they are seggregated from the flock is nothing short of criminal and short sighted indeed is the owner who follows such a practice. By all means feed and care for the ram prior to and durnig the breeding season, so that his vitality may be increased and manitained. If the ram is in prime condition and the ewe flock is well flushed before breeding, a bumper crop of lambs will dot our hillsides during the following summer and the returns fro mthe flock will be highly satisfactory.

To maintain the vitality of the rams during the breeding season, our best shepherds separate the ram from the flock during the day and feed him well, turning him out with the flock at night, for the reason that during the heavy breeding season the ram will not take enough time to graze sufficient food to maintain his vitality.

Then there is the matter of clipping locks and tags off the ewes that might interfert with proper copulation. This is a simple matter but it pays. A few minutes' attention to the ewes along this line efore the ram is turned out with them in the fall may mean a big percent of increase in your dividends from the flock.

Keeping records of the ewes that have been bred and those that have returned for service, should not be neglected. The ram will mark the ewes that have been bred if his breast and between his fore legs is smeared with red chalk or red ochre. After the ewes are all bred the red may be substituted with charcoal, so that ewes returning for service will bear a black mark. Ewes that fail to breed or that return too frequently for service, will give better returns by fitting them for the block.

The foregoing ideas are not new to many of our readers. They are ideas that are founded on facts, and he who would get the maximum returns from his flock will do well to follow the lead of our best shepherds, who are ever diligent to know the tsate of their flocks.

PIGS HAVE MANGE

A. T.—I have 3 pigs, two of which are brood sows. They are about 8 months old. They grew all right until about three months old and then they began to rub themselves against the walls. Their skin is dark grey. They have no lice. The hog shakes his head as though he had something tickling in his ears. They never refuse feed. One of the sows has a litter of little ones. They also rub themselves. Kindly advise treatment and oblige.

Ans: Your pigs seem to be troubled with scab or mange. This is a very troublesome disease caused by an itch insect. You can tell by examining them under a glass. It is difficult to get rid of when the place is once badly infected.

Give the animals the following dose, once a day for two weeks: ½ ounce flowers of sulphur and 1 drachm nitrate of potash. Mix and give in the food. Rub the animal with soft soap and at the end of an hour clean well with warm rain water. When dry prepare the following:

1 pint train oil.
2 drams oil of tar.
1 dram petroleum and flowers of sulphur to make a thick paste.

Rub this in thoroughly and let it remain three days, then wash with strong soap suds and if the difficulty is not removed repeat the application of the ointment. The animals must be changed to perfectly clean quarters, with clean bedding. Burn all old bedding and paint the floor cracks, and every surface outside and in, with quicklime slaked with carbolic acid, one part to -00 of water; or get the carbolic liquor from the nearest gasworks and slake with that.

COW WITH LUMP JAW

R. J. W.—I have a yearling heifer with a very hard lump on her jaw. Six weeks ago it was about the size of a hen's egg, but now it is many times that size. It seems very hard and solid to jaw one. What treatment would you advise to remove it? Is it lump jaw and do you consider it contagious?

Hard swellings such as you describe are sometimes caused by bad teeth, such as split, broken or ulcerated ones. We would advise you to examine the mouth very carefully before giving any treatment and notice particularly if the animal seems very tender when chewing. In case a bad tooth is found you will have to get it drawn before the cow will get better.

If no sore tooth is found in all probability the trouble is lump jaw. This disease is considered contagious, but is curable if taken in the early stages. Therefore action should be prompt. The medicinal treatment consists in giving an affected animal one drachm of iodide of potassium, three times a day in a solution of soft feed till the effects of the drug are visible in the production of slavering at the mouth, tears in the eyes, loss of appetite and scurfiness of the skin; then stop it for a week or ten days and repeat. This condition will develop so as to be seen usually in ten to twenty days. A couple o fmonths of this treatment will generally cure all cases affected in the sofe tissues. The above doses are right for a three-year-old steer weighing 1,400 pounds; smaller and younger ones should get proportionate doses. As soon as an animal shows signs of having the disease it should be isolated and kept there until cured or destroyed.

The meat or milk of an animal affected with this disease should not be used as food for man or beast.

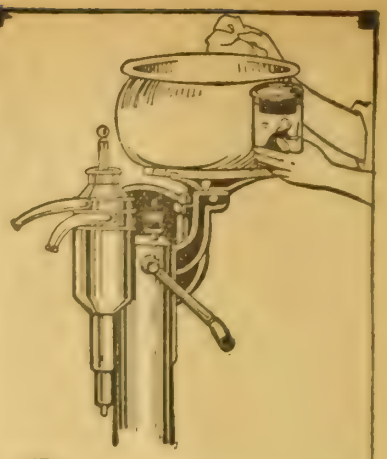
TAKING CHANCES WITH DEAD ANIMALS

Feeding dead animals to hogs should be a criminal offense. Hogs may contract many contagious diseases from eating carcasses. For instance, a cow died suddenly and was dragged out for the hogs to eat. In a few days they swelled in their throats, and as the farmer said, "all died of the quinsy." The fact was, the cow died of anthrax, and of course the hogs died of the same disease. Frequently the question is asked, "Why is it not safe to feed dead animals that are not diseased?" The proper reply is, "How do you know the dead animals were not diseased?" Don't take chances.

"FOUL IN THE FOOT"

G. R.—I have a cow that has become lame in one hind foot. The claws are somewhat spread apart and the foot is badly swollen. I can see no injury that has caused the trouble, but the skin has become cracked between the claws. Can you indicate treatment? I bought her about a week before the trouble began. Was the foot likely to have been infected before I bought her? She eats well.

Ans.: The cow had een liable to this foot trouble or she had partially recovered from an attack at the time you bought her. The ailment is commonly termed "foul in the foot," and is caused by wading in wet, mud, manure, grit or filth, and lodging foreign objects, such as pieces of cornstalks, between the toes. Light scratches or wounds of the hoof-head and fine skin between the toes readily become invaded by the filth germ, bacillus necrophorus, which then causes ulcers or canker (eating-sores). So far as possible do away with the causes which induce the disease. Keep the cow in a clean box stall. Treat by perfectly cleaning the foot; if need be, apply a poultice of hot flaxseed meal, and when clean cut away every bit of loose or rotten horn of the hoof and scrape each sore clean. Then immerse the foot for a few moments in a solution of



For
Dairy Utensils
use
Old
Dutch
Cleanser

It cleans quickly and thoroughly. It is better and more economical than soap or any other cleansing material. Use Old Dutch for cleaning everything throughout the house—it lightens labor.

"The essential characteristic of Shorthorns is beef, but a beef breed that can show a herd with more than 40 cows with milk records ranging from 10,000 to 13,232 lbs. is worthy of careful consideration."—B. O. Cowan.

SHORTHORN CATTLE

two ounces of sulphate of copper (bluestone) in hot water and then cover the affected parts with oakum or cotton soaked in a five per cent. solution of coal tar disinfectant and kept in place by means of a narrow bandage passed between the toes, criss-crossed about them several times and then tied around the pastern above the hoof. Renew the dressing daily until well.

OBSTRUCTION IN A COW'S GULLET

F. C.—Kindly let me know what is the matter with my cow. She runs water from the mouth. She eats very little and does not chew her cud. The last couple of days she throws up big chunks of chewed matter. She has been fed hay and was doing fine before this happened. Do you think she has lost her cud?

Ans.: The cause of this trouble may be from a broken or sore tooth or it may be from some foreign substance lodged in her throat. The cud of an animal is nothing nore or less than the food that has been eaten and passed into the paunch when it is softened and returned to the mouth for further mastication; hence if food is not passing up or down she will have no cud and will soon starve to death.

In the first place examine her mouth and teeth. If they are normal feel along the gullet and see if you can find any enlargement caused by something having been swallowed that has lodged there. Try and see if you can see it from the mouth. If you can, put a plow clevise crosswise, get someone to hold it and the cow, and put your hand through and try to remove it. If this does not succeed give the following: Epsom Salts, 1½ pounds, brown sugar, ½ pound and salt, 1 tablespoonful; mix and give as a drench. If this does not give relief give: Raw linseed oil 1 pint, sweet spirits of nitre 1 ounce, and common soda 1 tablespoonful. Mix and give as a drench every second day. If this does not soon give relief you had better get a Vet. to examine her with a probang or perform the operation of rumenotomy, but the trouble is likely in her gullet.

NON-PROLIFIC RAM IN POOR CONDITION

T. C.—I have a ram two-years-old, in winter he gets very thin, fed hay all winter last year and from 13 ewes there was only 4 lambs. What is the cause of not having more lambs.

Ans.: A ram that is only fed hay all winter and that is in thin condition all the time is no use as a breeder. Flushing of rams is as necessary as flushing of ewes, in order to get the profitable flock of hardy lambs. A tup lamb that was thin when weaned, if kept for a breeder, must get lots of nourishinf food before he can be in trim for breeding. This is probably what is the matter with your sheep. The teeth of sheep do not bother them much at the two-year-old stage. When he proved so useless a breeder last year it is bad policy to use him again, feed him and get rid of him. Hay alone, and if it is timothy, is starvation ration for a ram that is expected to become the parent of a healthy and large percentage of lambs per ewe.

GIVE THE BULL HIS PROPER TREATMENT

It is a big mistake, in my judgment, to allow any bull to run in the farm herd, no matter what the breed. The fact that so many bulls at full age become dangerous and grow unruly, go where they please, breaking down fences as they go, and doin genough damage more than to pay for their keep if kept tied up and fed the year 'round, is due to this practice.

In a large herd of pure-bred dairy cattle like we keep, we are compelled to keep two bulls to prevent in-breeding. Soon after starting my herd I built a bull stable sixteen feet square with a partition through the centre. My outside pens are sixteen by twenty feet in size with a breeding pen of the sam size that connects with both outside bull pens. This I find very convenient and would not do without it. The stable is floored with old railroad ties, which I find are much better than a plank floor, as they allow all the water to run down between them, and the floor is always dry and rough enough to prevent the bulls slipping as they go in and out.

It is a good plan to swing a block of wood on a cable just high enough so the bulls can bump against it, so they can play with it and in that way get exercise. I would never keep an animal of this kind tied up, for that prevents it getting any exercise. Our bulls never know what grass tastes like; they live on alfalfa hay and a little silage in winter. You would be surprised, until you try it, how little feed it takes to keep them growing and in good condition. We do not try to keep them fat, but only in good condition. We always know where to find them when wanted, they never get cross, and never bother our neighbors, which saves swear words on both sides.

We breed our cows when we want to. We can keep an exact record of the time when the cows will fershen, and all of these things are important on a well regulated farm. I am sure if one would consider his time in running after the animal and keeping in repair the damage by a bull running at large, he would find that keeping him up, and feeding him the year 'round, is by far the best and cheapest way. A. M. TEMPLIN.

PICKING A DAIRY SIRE

The age of the bull so far as known has nothing to do with the characteristics he transmits. The advantage of the mature bull is that generally it is possible to see some of his daughters and in this way judge as to the character of his offspring. In buying a young bull the pedigree with records o fhis ancestors are the chief things to take into account. The mother of the sire selected should have the characteristics wanted by the breeder. As a rule those who buy bulls now require that the dam have an advanced register test which gives exact information as to her dairy quality. If the mother of the bull is one of a large group of high producing sisters, the chances are especially good that the characteristics will be transmitted. This would indicate that the animal in question belongs to a high producing family.

It is not wise to select a bull from a cow even with a wonderful record if she is the only good animal in her family. In this case she is a freak in her family, and will probably transmit not her own high milk production butthe average of the family to which she belongs.

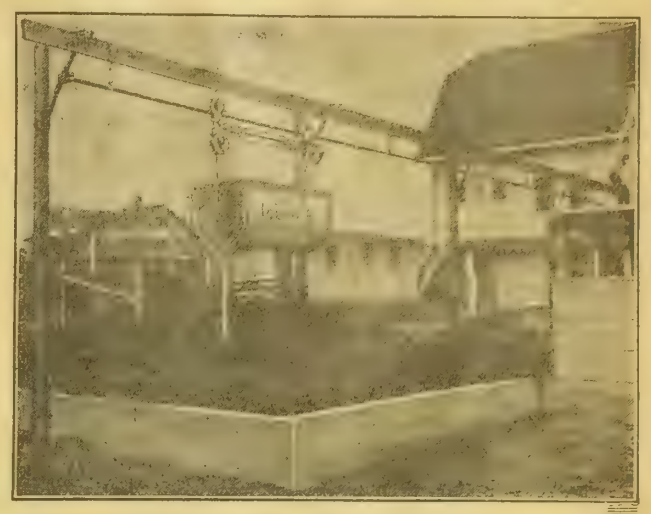
For a high-producing, purebred herd the safest way is, so far as possible, to select a bull old enough to have daughters in milk. It is then possible to judge fairly accurately as to the character of his offspring.

GIVE COW A CHANCE

Cows are made with capacity for consuming large quantities of rough feeds but this should not be taken to mean that they can reach their highest production of milk on such feeds as corn fodder, wheat straw, and refuse hay. They require nutritious feeds, too, such as clover and alfalfa hay, corn meal, bran, oilmeal, etc. Give the cow a chance to show what she can do by feeding her properly. If she does not come up to the mark, sell her and get another one that will. But don't condemn your milk factory until you have furnished the raw material with which it can work.

LOUDEN

LITTER CARRIERS SAVE ONE-HALF THE BARN WORK



Meet your present labor shortage by installing a Louden Litter Carrier. With it you can actually save one-half your barn work—every day in the year—for years to come for it will last as long as the barn stands. Think what that means to you, not only in the saving of hired help, but in the satisfaction of knowing that the Louden Carrier will always be on the job doing its work satisfactorily.

LOUDEN LITTER CARRIERS are built for ease of operation, convenience and long service. The gear is hung on Swivel Jointed Trucks, making it just as easy to run on curved track as on straight. The track wheels are set as far apart as possible to prevent jumping and jerking, and are roller bearing with ⅞" Tempered Steel Axles.

You can't overload a Louden Litter Carrier box. It is constructed of heavy Galvanized Steel, reinforced with angle iron—has few parts, and is made for heavy work.

Perfectly balanced—it dumps easily and a slight touch with the fork or shovel, swings it back into latched position.

BUILT TO FIT ANY BARN OR PURSE

We have the outfit that exactly suits your barn, and that will pay for itself over and over many times. Write us what size and style of barn you have, the number and kind of stock, etc. We will be pleased to advise you as to your needs and exact costs of same.

Have you seen OUR NEW ILLUSTRATED CATALOGUE?

It shows the complete line of Louden Barn Equipment, including Litter and Feed Carriers, Stalls and Stanchions, Hay Tools, Horse Stable Equipment, Cupolas, Water Bowls, Animal Pens of all kinds—"Everything for the Barn." Sent free on request.

THE HORSE

POINTS IN THE STALLION THAT INDICATE UTILITY, HEALTH AND CONSTITUTION

Draft stallions are apt to come out at the commencement of the season in a very fat condition and thus are able to hide many defects which would perhaps be apparent if seen in working condition. The best way to ascertain if the horse is heavily fleshed and has a covering of muscles and not fat, is to examine the fore arm. This part of the horse is never padded with fat, and if it is heavily muscled it is a sure indication that the rest of the body is the same. To know the difference in the forearm as between the light horse type and the heavy type is a point of importance in choosing the stallion. The long fore arm belongs to the light type and running horse, and is in no way fitted to do the work of heavy pulling. For speed the long fore arm is indispensable and for pulling, the short fore arm and short cannon bone is required.

Some horse judges place too much distinction between the slope of the shoulder of the light horse and the heavy horse, preferring the upright shoulder for the heavy horse and the sloping shoulder for the light horse. The horse with the upright shoulder should be avoided, as such a formation increases the concussion of the bones when the foot strikes the ground and unsound limbs are the result. It increases the length of the back and gives the horse a stilted action. Also all the horses that have upright shoulders have upright pasterns, and this gives rise to the many diseases that affect the joints of the feet and legs due to the lack of cushioned springiness that slanted pasterns always secure.

The slope of the shoulder may not give the heavy type any advantage in pulling power but it indicates the quality that endures and the class of horse that is speedy and serviceable at work. Speed in a heavy draft is one of the features that has only been lately advocated in heavy horse breeding, and the draft sire to choose is the one that shows a combination of speed with weight.

Speed at Heavy Work

The draft horse of the future and the one that is at present in greatest demand, is the one that can develop speed at heavy work. As in all breeding of dual purpose animals there is apt to be an inclination to favor one characteristic and the balance is then lost. For instance, the cannon bones or ankles of the light horse are described as being flat, wide, and looking fine and thin from the front view. This description would fit the heavy horse as well, only the bones must be stronger. Coarse and porous bones are not to be chosen, and these are indicated, to a certain extent, by the fineness or coarseness of the hair and skin.

Do not choose a horse simply because he has a high flowing pedigree unless he is a high class horse himself. Use your eye and hand alike in the choice. Run the hand down the leg over the knee and cannon bone. The hair and skin should feel soft and pliable to the touch, and the bone smooth and firm. The tendons should be flat and thin, round and coarse tendons are associated with round and porous bones. A coarse thick skin is also a sign of soft spongy bones that cannot endure under strain or hard work.

The knees and hocks of the draft sire should be large. There is a decided tendency on the part of some judges in exhibition rings to give decisions favorable to fineness in knee and hock joints. Provided the largeness is due entirely to size of bone and not to fleshy puffiness, the hock should be as large as the symmetry of the horse will admit of. The hock has a wonderful and complicated duty to perform, and if at all faulty in formation, or small and weak in bone, it will give way to some of the many diseases that fall to the lot of weak hocks. The hock of the running horse is carried low down in the leg as in the greyhound, but in the draft horse it should be more equally placed between the hip and the foot.

The quality of the rest of the horse is generally carried to the feet, but they deserve special attention as sound feet are rather rare in the domesticated horse. This is due to the changed use that horses' hoofs are put to in the pulling of heavy loads over hard ground, instead of galloping over the soft prairie in nature. The common defects of the feet of the heavy horse are: Soft hoof, dry and broken hoof, flat hoof, low or sloping heels, and too large a hoof. The best feet are round, of equal size and shape and perfectly sound. The best quality of hoof is dark in color and has an oily coat of natural wax. Lift the foot and see that the quarters are well united to the frog, and that the sole is well arched.

Color of Eye and Coat

In buying a horse or choosing a breeding animal, color should not be overlooked. Color is an indicator of health and general temperament. In the color of the eyes, for instance, hazel brown is an indicator of spirit, robust health and constitution, while very light colored eyes are not strong in themselves as objects of vision, and often accompany weak constitutions. And a horse that shows too much white of the eye is apt to be tricky and unreliable. There are more hereditary defects in the eyesight of horses than many farmers conceive, and many of the so-called vices of horses are due more to partial blindness than to any other cause. Most of the careful judges of horses make the eyes their first point of examination, whether it is to buy or place in the prize list. Bad eyesight in a horse is a serious fault, and a dull eye shows a dull horse with a weak vitality. Look for the keen, bright, hazel eye and there will be found some fire and hardihood in the animal.

If the horse's coat is naturally glossy and pile short, it is evidence also of good health and temperament. Dark bay, brown, black, steel grey, and dark chestnut are the best and hardiest colors.

Breeding to color can only be recommended in as far as it seeks to eliminate all those colors that generally show inherent weakness of constitution.

The light sorrels and very light bays and similar colors are as a rule bad doers. They are generally hard to keep and have not the endurance that generally follows the hardier colors. Attention to color is not without its value and should be included with all other points. Extreme climatic conditions affect light sorrels, sandy and similar colored horses found in heavy draft classes. They do not stand the extreme cold and are not naturally well protected from any extreme temperatures. They have not hardihood and generally include all those horses that are hard keepers, and do not make a good use of their food.

RULES FOR THE CARE OF SHOES AND HARNESS

Old friend leather is in bigger demand today than ever before. As one of importance he is in a position to distate how he shall be treated. He has a right to say: "Never put straight neat's-foot oil on shoes or harness. If you wish to waterproof your boots or shoes, brush them and then rub them well with a lukewarm mixture made by melting one part mutton tallow, one part beeswax, to which is added one part of pure neat's-foot oil.

"Neat's-foot oil is a great penetrator, and goes all through the leather. If used straight it makes the leather soft and flabby and does not waterproof. But if tallow and beeswax are added the neat's-foot oil carries them in and they stiffen and waterproof the leather. To dry boots or shoes, place them in a warm, dry room; never near a fire, register or radiator. When almost dry, yet still slightly moist, rub the shoes or boots well with the mixture of oil, tallow and wax. Not only does the mixture waterproof the shoes, but it adds to the life and the wearing quality of the leather. Often it is well to scrub shoes or boots with lukewarm soft water, pure soap and a brush, then dry and oil."

Old friend leather is a clever old codger and likes to hang round a lot. He'd hang on the harness pegs in the barn longer stretches at a time without renewals if only his bath suited him better. Says he as to his bath and "oiling" harness with water:

"Harness should be taken apart to be oiled. That is necessary that the wearing parts may get sufficient oil. Put a little soda in a bucket or tub of lukewarm rain water or other soft water and soak the harness two or three hours, except collars and padded parts, which should not be immersed. After the soaking, scrub each piece of the harness wit hpure soap and a stiff brush and hang up in a warm, dry roo movernight. The harness should be slightly moist from the bath when the oil is applied. It should be warm, not cold, and the oil, consisting of one part pure neat's-foot oil and one part any good, standard harness oil, should be lukewarm.

"If only a few sets of harness are to be oiled, the oil mixture may be rubbed in. But if there is a good-sized job on hand the harness, except collars and padded parts, may be soaked an hour in the oil mixture, then drained and rubbed dry. After the harness has dried from the oiling, wash lightly with lukewarm water and a good harness soap. The oil will not injure patent-leather parts.

"Harness and saddles should be kept hung up in a protected place. Water should not touch them oftener than is unavoidable, except at the periodic washing time just preceding oiling. In the working time sweat and dirt form a film on the harness. This hardens and prevents the oil from penetrating well. Neglecting to wash harness is wearing out the leather before its time, just as drying shoes near a stove, where they dry out quickly, wears out the leather more quickly than if the shoes were in real service.

"Every few years saddles need oiling. They, too, should be washed with water, soap and brush, then dried, and pure, white, transparent neat's-foot oil applied to the under side of the leather. If applied to the upper side it must be put on very lightly and carefully, or it will soil clothing for weeks."

Old friend leather dislikes fish oil because it attracts rats.—S. ORRICK.

HURRYING HOT HORSES

Hurrying hot horses is the very thing that should not be done. If that fact were always remembered there would be few horses killed by heat, even in so hot a summer as we have had this year. Hurrying requires extra energy and develops heat in an animal in even greater proportion than the extra speed secured. What is the use hurrying, if a stop must be made after awhile to cool off?

The contrast was well illustrated one hot day at oats-cussing time. A man with a slow, plodding team of heavy horses went to help his neighbor finish a field. The neighbor led off around the field with an occasional crack of the whip. His horses were less drafty and would be popularly considered a good type to endure the heat. By the time they hurried around the field they were panting hard. He stopped to rest them and tinker up the binder until the visiting team caught up. The visitors took their own time to it and finally came into sight with a slow, easy mechanical step. They were cool enough to start right on with the next round. They continued thus all afternoon. Each team went the same number of rounds, but the hurried horsese were as hot all the time as the driver dared to have them, while the team that went slowly and steadily was comparatively comfortable.

The impatient driver gained nothing by his attempt to hurry. If he had possessed a little less judgment he probably would have overheated and perhaps killed at least one horse. As it was, he ot his horses into a weakened condition because of distress from heat. They ate poorly at night and were also low in vitality the next day. Even for one day's work the hurrying was a mistake; for a season's practice it would not do at all. The horses that had vitality and energy to go on day after day were those those powers were preserved by patient driving.

CARE OF COLT AFTER CASTRATION

G. O. P.—I have a one-year-old colt, that was castrated 3 weeks ago. Some time after the operation he goes weak on his legs. He is now lying down and is unable to get up. Does it arise from the operation and if colt dies is the operator responsible?

Ans.: Evil results of castration are very rare when proper precaution have been taken. These precautions, however, included those of the caretaker after the operator has done his part. The weather during the past three weeks has not been at all favorable to castration if the colt has

been exposed night and day to cold ains. If he has been kept in at nights here is equal danger in a dirty man- er or box stall. Seeing that both oper- tor and caretaker are dually respon- ible for the health of the colt it is mpossible from your statement to say n which the blame can be laid.

VORK THE STALLION AND AID FERTILITY

The theory that the stallion should pend his time in idleness cannot be oo strongly condemned. The idle tallion spends his time in useless lay or frequently in the cultivation f bad habits. The stallion worked very day has his energies diverted long useful channels, which adds to is breeding ability and tractability. The stallion driver and handler hould be a horseman of ability and hould possess an unusual amount of atience. Conditions may arise in the rst few lessons that will require a lear head and good judgment. If the tallion is to be worked in a team, the eam mate should, if possible, be a nare. The stallion will be more quiet nd docile in the company of the op- osite sex than with a gelding or an- ther stallion. The stallion as a rule s strong and willing but frequently oft from lack of work and usually fat. 'he work should be placed upon him radually until he is doing his share. rdinarily half a day is enough for he stallion's exercise, but many of hem are working a full day and get- ing a large percentage of colts.

OLIC ATTACK IN BREEDING MARE

R. E.—I have a mare that has had wo colts and is in foal again. She as bred when nine years old and had ever been sick in her life, but now has sick spells quite often, acts like colic. She eats all right, looks well and is in the harness every day. Her feed is 12 quarts grain, hay. Can you give any cause and help for it? Does it come from feeding?

Ans: It is not uncommon for a mare in foal to have slight attacks of colic. They will be less likely to occur if you allow the mare to occupy a roomy box-stall when in the stable, but have her work or take active exercise out of doors every day while in foal. She must not be allowed to stand idle for a single day. Give the drinking water before feeding. Add one-ninth part of wheat bran to the whole oats, dampen it at feeding time and feed it from a large box to prevent bolting. If she still bolts her feed add cut (chopped) hay or straw. If she eats her bedding use planing mill shavings or sawdust instead of straw. Allow free access to rock salt. See that the bowels are kept active. If there is a tendency to constipation feed a few carrots and increase the amount gradually as required as soon as she has become accustomed to this feed.

MARE WITH EYES BADLY INFLAMED

G. W. H.—What ails my 13-year-old mare? She has periodical attacks of inflammation in her eyes, they seem to be as clear as ever, but give her pain and much trouble when the attack is on. I have tried several remedies but none of them seem to make any difference.

Ans.: Your mare is affected with that form of inflammation in her eyes which has the peculiar character of remitting or disappearing for a time. The eye, after an attack of inflammation, regains so nearly its former natural brilliancy, that one could not detect that anything was the matter with them. Bathe the eye with warm water having a small quantity of salt in it—a teaspoonful of salt to a pint of water. Foment the eye half an hour at a time, three or four times a day. Smear across and into the eye the white of an egg. Apply lotion, six to eight times a day, made as follows: Atrophin sulphate 2 grains, water, one ounce, mix and use camel hair brush, and let the lotion under the eyelids as well as over them. If the eye begins to get cloudy, apply the following lotion with camel's hair brush: 10 grains nitrate of silver and 1 ounce of water, mixed together. Give the mare rest, with soft feed and a dark stall.

HORSE THIN AT 15 YEARS OF AGE

H. H.—I have a horse 15 years old that seems to feel well and have a good appetite, but is very thin. He has been out in pasture and I have been feeding three quarts of whole oats morning and night. He does no work. His teeth were ground last spring. Could you advise what could be given him that would put him in shape?

Ans.: Have the teeth again attended to by a veterinarian and then give, night and morning, one quart of black strap molasses mixed with two or three quarts of hot water and stirred among cut hay, wheat bran and cornmeal. Feed whole oats at noon and long hay at night. It may be necessary to starve the horse to the molasses feed at first, but he should soon take to it with a relish, and then should plump up quickly and in a healthy manner. Drugging with arsenic might have a similar effect, but is objectionable and a drugged horse soon "goes to pieces" when deprived of his dope.

NOSE RUNNING DUE TO BAD TEETH

A. G. H.—I have an old horse that for the last four days has had a yellowish matter running from the right nostril, with a very unpleasant odor. He eats well, but is poor and thin; never can put flesh on him. His teeth are poor. What is the trouble and what to give him to stop running at the nose?

Ans.: Examination no doubt will show that a split or diseased molar tooth in the upper jaw is the cause of the bad smelling discharge from the nostril. If so, it will be necessary to have the tooth removed by a qualified veterinarian, who may have to trephine the skull. That is done so that a punch may be introduced above the roof of the tooth and struck with a mallet to force the tooth downward into the mouth. Trephining also has to be done when pus is found present in a sinus of the skull. As glanders sometimes is present in cases such as you describe and is communicable and fatal to man as well as contagious and incurable in the horse, great care must be taken in handling a case. For that reason, too, an examination always should be made by a qualified veterinarian.

FOUNDER

J. K.—Is there anything that can be done for a foundered horse to relieve hi mof stiffness?

Ans.: Treatment of founder in horses is not usually attended with satisfactory results although in many cases the trouble can be relieved.

Soak the feet in warm water and salt in a tub containing 6 or 8 inches of water, two or three hours at a time, twice a day; every night put on a hot poultice of half linseed and bran, and leave it on all night. After the soreness is pretty well out blister around the top of the hoof with the following: Spanish Fly, 1 dram, vaseline or lard, 1 ounce. Mix and apply all of it around the top of both front feet and turn the horse out to pasture for a long while. Grease the blister the third day. After the horse is all right and he is brought in again, let him stand on a ground floor, for an animal once affected with this disease is more liable to be affected again, so be careful. The bar shoe is recommended by some.

If it is a horse you want to keep shod, and he is not of much value, keep him on a ground floor and pack the feet every night with cow manure, blue clay or anything that will keep the feet moist.

Butter Parchment at Farmer Office

POULTRY.

LOCATIONS AND SITES IDEAL FOR THE POULTRY HOUSE

A pountry house should face to the south so that the birds will receive the maximum amount of sunshine during the short days of winter. Sunshine is also a great disinfectant for the poultry house and is necessary at all seasons of the year. A well-drained location is also essential. When the birds live in a damp house there is an increased danger from colds and the birds may be greatly lowered in vitality. If the poultry yard around the house is undrained, the birds will have to walk in the mud and they will be apt to drink much dirty water. Walking in the mud leads to unclean eggs in the nest and fine quality eggs should be perfectly clean without the necessity of washing them.

The location of the poultry house in relation to the other buildings is important. Sometimes the house can be placed in the protection of a large barn or other building and then it will be less exposed to the cold winds during the winter. The poultry house on a farm should be near enough to the living house and the barns so that the distance traveled in caring for the birds will not be greater than necessary. If the poultry house is located a long distance from the farm home it may result in neglected fowls on the cold stormy days when careful attention is very important. Wasted steps are very expensive on a poultry farm as well as on any farm and every effort should be made to obtain a satisfactory arrangement of the building.

It pays to place the poultry house near a windbreak if there is one located near the house on ground suitable for a poultry building. Keeping the cold winds from striking a poultry house will help very much in keeping it comfortable for the birds. While sunshine in the house is quite important it is also fine to have shade during a part of the year. Evergreen trees should not be planted in front of the house to keep it cool in the summer as they will also keep out the sun in the winter. Fruit trees will furnish shade in the summer and then shed their leaves in the winter when an abundance of sunshine is needed.

Some recommend a sandy site for a poultry house and consider that a sandy farm is ideal for poultry production. It seems as if this is not entirely true. The sand is clean and drains easily, but if the soil is so poor that it does not produce an abundance of green food the expense of keeping the flock in condition is greatly increased. A flock that is yarded on land so sandy that it is practically bare of green food, will need green food supplied to them. A flock on soil that will support an abundance of clover is able to pick up much of its living during many months of the year. It seems that the soil on the poultry range should be well drained but it should also be good enough to furnish the hens plenty of the green food that they can gather themselves.

G. K. RILEY.

TO GET CLEAN EGGS WITHOUT WASHING

Many customers will not buy soiled eggs. Of two samples, one of clean eggs and the other of soiled ones, it would be hard to find the purchaser who would select the soiled ones, especially if the price is the same as for the clean eggs.

With eggs, as with most all other food products, beauty as expressed in cleanliness is an attractive feature and a valuable asset in a financial way. The egg is naturally clean and only becomes soiled because of the conditions of the nest where the hen laid. To keep the egg clean and attractive, the nest in which it is laid must be kept free from anything that would have a tendency to foul the shell of the egg. The materials with which the nest is lined, be they straw, leaves or other substances, must be fresh and dry and they must be removed as soon as they become soiled in any degree, and replaced with fresh, clean material. It goes without saying that the eggs should be kept in a clean receptacle and in clean surroundings from the time they are gathered from the nest until they are used for food.

The public has been trained to demand and buy clean eggs, and it is a wise training if its effect shall be to cause the producer to keep his product from becoming spoiled. But that "beauty is only skin deep" is true of some eggs. It must be remembered that eggs, although clean on the outside are sometimes not as clean as some with an outward dirty appearance. This is particularly true if the eggs have been washed in order to clean them for market and which have been held for some time either in or out of cold storage. The dirt, especially if it was of a dry nature, when it came in contact with the shell, is wholly upon the outside of the egg and which affects the appearance of the egg but in no way affects the quality of the edible part of the egg.

Any cleaning of an egg that may be attempted, should be done with a dry cloth or paper, and even this should not be so thorough as to remove any of the original coating of the shell. The shell contains and is coated with a gelatinous substance which prevents air and germs from passing through it and contaminating the egg to deteriorate and decay. Washing with water or rubbing with a wet cloth removes this protecting substance or destroys its effectiveness. According to investigations millions of eggs spoil unnecessarily in cold storage each year, because they have been washed or have in some way become wet before they were placed in storage.

In order to avoid this great and unneeded waste, let each of us use every possible endeavor to keep our eggs from becoming soiled. If in spite of this, any of our eggs should be found soiled, let us keep them apart from the clean ones and use them at home or market them by themselves. This will not only tend to decrease the loss, but will tend to greater peace of mind, and in the long run, to greater financial return from the poutlry yard.

C. H. SAPP.

IMPORTANT SIGNS OF CONSTITUTIONAL VIGOR IN GOOD LAYING POULTRY

A very important cause of good laying is constitutional vigor, for no matter how high an egg record the parent hen may have had, how famous the strain, how good the feed, or how well designed the laying house, a pullet that does not possess a good constitution is not fit for the business of egg production. To emphasize the importance of constitutional vigor, let us remember that egg laying is a process of converting material from one form to another, and only the birds that are capable of collecting, digesting and assimilating large amounts of suitable feed can be expected to contribute a good share to the egg yield. The trap nest gives us records of the mothers of the young pullets, but it cannot be depended upon entirely as a guide in selecting prospective good layers. The following method of grading pullets as they are brought from the colony houses in the fall to be placed in winter quarters is employed by the writer:

The first grade consists of birds having well-developed, bright-red combs and wattles; short, stout beaks; clear, wide-open eyes; close, smooth, glossy plumage; meaty breasts and thighs; clean, yellow, warm shanks. These birds are ready for laying rations, and if they were not hatched before April they are laying twnty-five per cent. by December first, and are depended upon for winter production. They keep up a good yield through spring and summer, and many individuals continue laying until November first.

CHEVROLET MOTOR CO. of CANADA, Limited
OSHAWA ONT
New Series
Four-Ninety
Touring

Pullets answering these qualifications, but hatched in February and March, generally begin laying too early in the fall. They molt, either with the old hens, or in the winter, and do not lay again to any extent until eggs ebcome plentiful in the spring. In the long run these very early hatched pullets have not been found profitable.

Birds in the second grade show a majority of the characteristics required in the first grade, but are not so well developed. They are kept separate from the others and are fed a lighter ration until they are better developed and nearly ready to lay.

The third grade is determined by all, or nearly all, the follownig characteristics: Small dull comb; long thin, pale beak; receding or partly closed eyes; small crop, containing little food at roosting time; rough, dirty plumage; poorly meated breast and thighs; pale, slender, cold shanks. The long flat heads of these culls often closely resemble crows' heads; hence they are known as "crow-heads."

It has been found economical to dispose of birds of this sort for killing, but they cannot be fattened.

There seems to be an opinion among some Leghorn breeders that, inasmuch as the good-laying hens become pale in shanks and beaks in the fall, the pullets selected for prospective good layers should likewise have pale shanks and beaks. In my experience this belief is not supported. The early maturing, first-to-lay pullets almost invariably have deep-yellow shanks and beaks, while paleness of the same parts generally marks the late-hatched, poorly developed and constitutionally weak birds. I contend that, whereas color disappears from the shanks and beaks of Mediterranean varieties usually in proportion to the number of eggs laid, the capacity for acquiring deep color is a strong recommendation to prospective good-laying pullets.

The proper use of concentrated feeds is also of considerable importance. A pullet in full lay will use a large quantity of mash containing twenty-five per cent. meat scraps and corn meal, without apparent injury, but a pullet not ready to lay will eat only a small quantity of the same feed, and if no less concentrated feed is accessible she will fill up on straw from the litter. It is for this reason that I separate the first and second grade pullets and feed a less concentrated ration to the second-grade birds until they "comb up" and are ready to lay.

J. P. PALCE.

RATIONS THAT GIVE BEST RESULT IN FINISHING THE CRATE FED POULTRY

An opportunity which is sometimes neglected, is that of crate-feeding broilers, fryers and roasters for a few days before marketing. To kill a good, strong, large- framed bird wtihout finishing is wasteful, for the growing of the frame is really the most expensive part of poultry raising, while the finishing is the most profitable. With good husky stock, good rations and good feeding practice, a gain of thirty-five per cent over the original weight for a feeding period of two weeks is the ordinary rather than the extraordinary event.

Chickens may be fattened at any age, but young, growing stock uses its

feed for both growth and fattening and so will make better use of the feed consumed than will fully matured stock. The prime essentials for profitable crate-feeding are healthy birds, palatable and digestible feeds and good feeding practice.

Vigorous stock for fattening is as important with chickens as with any other kind of livestock, and this factor cannot be overemphasized.

The big, bold, strong-headed cockerels that are inclined to eat the buttons off our coats are the ones that can digest and assimilate large amounts of feed in a short time and make the greatest gain from each pound of feed given.

The ration for fattening should consist altogether of mash feed moistened with buttermilk or skim milk to a mortarlike consistency. Corn meal, barley meal, bran, shorts, low-grade flour and ground oats may be used in the mash mixture.

Rations which have given excellent results are sixty per cent. finely ground corn meal and forty per cent low-grade flour.

Another practical ration may be made of fifty per cent. finely ground corn meal, thirty per cent. sifted ground oats and twenty per cent. middlings.

Buttermilk, skim milk, or some form of the milk ingredients in the ration for fattening are important, because they make the ration more palatable and because the proteins of milk are very efficient for growth and fattening. When fresh buttermilk is used, approximately two pounds will be needed for each pound of dry feed to give it the right consistency. During warm weather the birds require more moisture, and so the buttermilk mash should be mixed thinner.

Good feeding practice consists of confining the birds in crates or batteries, feeding glihtly at first and carefully at all times. The fattening birds should be confined in crates or batteries during the feeding period to conserve the energy which would otherwise be used in ranging. A satisfactory feeding crate can be made of scrap lumber, or a commercial feeding battery now made by a number of manufacturers can be used. A home-made crate for ten broilers or springs should be about two feet deep, three feet long, and sixteen inches high. It should be equipped with a lath or wire bottom so that the droppings will fall through to the tray below. A trough for feeding the buttermilk-moistened mash should be placed along the front.

Feed the fattening stock lightly the first few days, gradually increasing until on the third day and after the birds will be given all they will eat in half an hour—morning, noon and night. And feed left in the trough should be removed from each feed so the birds will have a good brisk appetite at the next time. Skill in feeding consists of getting the birds to eat as much as possible without putting them off feed. The skillful feeder can keep good vigorous springs eating well for a period of sixteen days, after which the stock is sent to market as prime milk-fed poultry. As such it commands a premium in every important market.

F. E. M.

STUNTED CHICKS MAKE POOR HENS

Undeveloped. weak, stunted chicks are very often the result of improper methods of feeding or care, especially during the first six weeks of the chick's life.

Incubator chicks, when brooded under artificial conditions, will not gain in weight as they should unless handled and cared for properly, and they will soon become stunted and eventually will die. Often this condition is attributed to "low vitality" or perhaps "poor" breeding stock receives undue criticism.

In many instances young chicks have been found literally starving to death, not because of lack of food, but because of some irregularity in their care. They may not be diseased; the trouble is more generally a matter of malnutrition or inproper nourishment.

When chicks mope round, act listless and are inclined to sleep most of the time they should be removed at once from the rest of the flock, given special attention and feed, and placed in warm, dry, well-ventilated quarters.

If the sick chicks are removed in time a majority of them can be brought back to life, so to speak; but if they are allowed to drag along in the hope that they may recover unaided, extra loss will be occasioned. Remove the chicks just as soon as they are seen to be out of condition.

Upon removing the sick chicks to new quarters, feed them a little hard-boiled egg—not too much at first because of their weakened condition. The hard-boiled egg is not only feed, but it also stimulates the chicks' appetites. Allow the chicks plenty of whole or cracked wheat, but do not let the feed accumulate. Feed, if scattered and left lying round, is not only wasted by the chicks, but also it invites extra loss by mice or sparrows, and becoming spoiled by the droppings is made dangerous for the chicks to eat.

After the chicks have eaten they must be kept warm. A constant supply of water is necessary. After several days the chicks may be given regular care and will manage to pull through with very little difficulty.

Although with extra care and feed the stunted chicks may resume their normal condition, size and weight, it is not advisable to keep them over the fall and winter.

HINTS IN CRATE FATTENING

Do not feed the birds for twenty-four hours after putting them in the crate, and then feed very sparingly for several days. Keep the birds hungry for two or three days and gradually increase until a full feed is given; then feed twice a day just what they will eat up clean. Clean out any feed left in the trough after each meal. Dust the birds for lice before starting and again before killing.

IT PAYS TO FINISH POULTRY

Even with the present high price of feed no one can afford to sell birds and especially cockerels, in a thin condition. The good prices received for poultry meat more than pay for the extra feed, and if there ever was a time when birds should be finished, it is now.

As a war measure the marketing of thin chickens should be prohibited. The most expensive part of the bird to produce and that, which is of the least value for food is teh frame. The cheapest weight for the feed fed is the flesh as it is all edible, the necssity of putting this flesh on is evident.

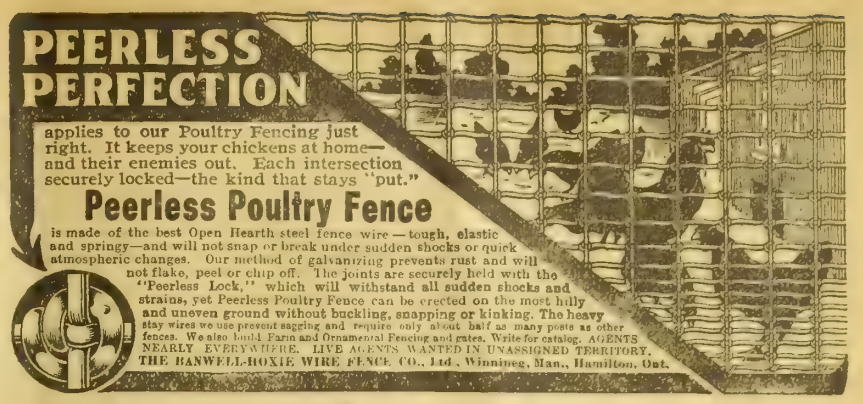
The most profitable weight at which to finish cockerels is when they weigh about 4 pounds, but even earlier birds may be fed with profit, as several experiments conducted at the Experimental Farm this summer go to prove.

Poultry meat o fall kinds has been a good price. Hens have been selling as high as roasters and broilers have paid well. Leghorn cockerels at the Experimental Farm have been sold at about 2 pounds each, and because of being specially finished on milk, brought good returns and paid well for extra feed. Four different lots marketed in August, 152 birds, weighed 280 pounds, they were fed for about ten days during which time they gained 60 pounds, weighing at the end of the feeding period 340 pounds. They consumed 180 pounds of mash and 24 gallons of buttermilk. The mash was composed of 2 parts corn-meal, 1 part middlings, and 1 part buckwheat screenings.

The cost of feed was 180 lb. at 4c per lb.—$7.20 and 24 gal. milk at 5c per gal.—$1.20, making a total of $8.40 for feed and milk. Add to this the value of the birds at the state 280 lbs. of thin chickens that would bring $35c per lb. $98.00, and it makes a total cost for thin chickens and feed of $116.40.

The weight of the finished chicks was 340 lbs., having gained 60 lbs. in the 10 days feeding. The value per lb. was increased because of the quality of the flesh to 50c per lb., making the total value of the birds $170.00.

This meant a revenue of $54.00 for the care of 152 birds for less than two weeks. It also showed that for every pound increase on the birds it took 3 lb. of mash and 4 lb. of milk or an average cost of 14c per lb. of gain.



PEERLESS PERFECTION
applies to our Poultry Fencing just right. It keeps your chickens at home—and their enemies out. Each intersection securely locked—the kind that stays "put."
Peerless Poultry Fence
is made of the best Open Hearth steel fence wire—tough, elastic and springy—and will not snap or break under sudden shocks or quick atmospheric changes. Our method of galvanizing prevents rust and will not flake, peel or chip off. The joints are securely held with the "Peerless Lock," which will withstand all sudden shocks and strains, yet Peerless Poultry Fence can be erected on the most hilly and uneven ground without buckling, snapping or kinking. The heavy stay wires we use prevent sagging and require only about half as many posts as other fences. We also build Farm and Ornamental Fencing and gates. Write for catalog. AGENTS NEARLY EVERYWHERE. LIVE AGENTS WANTED IN UNASSIGNED TERRITORY.

MOULT SEASON CARE OF POULTRY

Every year at the beginning of the moulting season a great many poultry keepers become uneasy as to the way the fowls should be fed. Because of the publicity formerly given to certain systems that had as their object the hastening of the molt, there still exists, on the part of many beginners, a tendency to try out such schemes.

A few years ago careful tests were conducted by one of our leading poultry experiment stations with a view to determining the real value of the different feeding systems advocated in connection with the molting season. The results showed that it did not pay to hasten the molt—that the hens that were continued on the regular rations made a better showing at the end of the year than did those fed by a special process.

The feeder who is anxious to keep his birds in good condition during the molting season should continue the regular rations with one or two slight changes.

WOMEN'S INSTITUTE SECTION

This section of the Maritime Farmer will be devoted to the interests of the Women's Institutes of New Brunswick. We respectfully solicit contributions from all branches, touching upon matters of general interest. We wish the members of all branches of the Women's Institute to feel that the Maritime Farmer wishes to fully assist them. The Maritime Farmer is the official organ of the Women's Institute of New Brunswick. We would suggest that YOUR BRANCH name a press committee, so that news from YOUR BRANCH may reach other branches.

STRONGLY SUPPORTS MARITIME FARMER

The following contribution was received from one of the leading workers in the Women's Institutes'.

The adoption of the Maritime Farmer as the official organ of the New Brunswick Women's Institute, is a long stride in a right direction. This Province has wasted too many years floundering along behind other older and larger and more assertive Provinces; too much of its time and money have gone towards supporting outside interests to the neglect of its own; it has been altogether too good naturedly content to accept dictation from any self-qualified source; but this action predicates an awakening and a determination to apply remedial measures. New Brunswick's organized women realize its qualifications for leadership; they have set the pace in turning their subscription dollars to the support of a home journal, owned and published in the Province, with aims and objects identical with their own and devoted to provincial interests and provincial problems.

The Institute is a big and growing organization, a co-ordinated body with groups of active, energetic workers all over the province, all units working together, in the best interests of New Brunswick. They realize their obligation of contributing their bit to the work of reconstruction and to that end of studying the various problems that will arise after the war—social, industrial and commercial. The co-operation of the Maritime Farmer, along these lines will be incalculably valuable. Their advocacy of a Maritime union preparatory to nationalization of Institutes, bringing town and country women together in an exchange of ideas and opinions, and many other things, can be effectively done through the columns of the Farmer.

Altogether, the Institute is to be congratulated upon a move which is bound to be far reaching in its consequences, and the Maritime Farmer upon the recognition by an important body of women of its provincial worth.

AN INSTITUTE MEMBER.

The beauty of the house is the order;
The blessing of the house is contentment;
The glory of the house is hospitality;
The crown of the house is godliness.

HOUSE OF CORRECTION

Had Ralph Cochran come across Jeffrey Blake anywhere except in the surge of the city's homeward bound traffic he might have thought twice before grasping his old chum's hands and exclaiming: "Come on, my train's pulling out. You've got to come home with me!"

Under other circumstances perhaps Jeffrey also would have hesitated. He was uncertain how he would take it to see Ernestine another man's wife, even though that man was Ralph Cochran.

"Unexpected company! Rule three broken!" groaned Ralph suddenly.

"What in——" began Jeffrey.

"The tragedy and the comedy of my married life! It'd be mostly tragedy if it wasn't for Cis. She's the only one that isn't afraid."

"You've changed some, old chap. You used to talk intelligently. Has happiness gone to your head? And how is Ernestine?" Jeffrey tried to make the enquiry sound casual.

"It's this everlasting trying to toe the mark that's gone to my head," said Ralph. "Ernestine's never anything but all right. Now ask about Cis. I have a suspicion that there's just one man in the world for her."

"There's nothing so remarkable about that. Let's smoke."

Ralph shook his head. "Dasn't. She'd smell it."

"You've not given that up? I say!"

"Rule one," grimaced Ralph. "But, Jeff, why don't you take an interest in Cis?"

"Frankly, Ralph, I never could even see that shockheaded cousin of Ernestine's. I detest a woman who doesn't keep herself up to the notch. Her hands are generally grubby. Why, I remember Cis coming to one of the picnics with the top of her shoe fastened with a safety pin where she'd lost the buttons off. And you can champion Cis when you have such a model as Ernestine!"

"Ernestine never in all her particular life had a single hair of her head out of order. I suppose all the men were so crazy about her because she seemed to embody all the virtues of the model women of all time. But, old boy, you don't have to live up to all this perfection."

"More's the pity!" said Jeffrey in an undertone.

"But Cis was only a kid then," continued Ralph. "I remember it. She sat down on her feet and wouldn't join in anything until I wormed out the reason. She said the buttons burst off when she was flung playing crack the whip. She didn't start out to the picnice that way."

They stopped before a small, neat house.

"It's muddy, so we'll go the back way," explained Ralph. "That's rule 5. And clean your feet on this mat—rule 6."

"You seem to live by rule," joked Jeff.

"I do," replied Ralph. "And Ernestine lives by ruling. Observe the slip of paper tacked to the kitchen door; likewise, there is one next to my chiffonier. Those are the Ernestine rules that shape my course of conduct."

"For pity's sake, Ralph, what are you doing out there?" interrupted a high-pitched voice that failed to recall the Ernestine Jeff had been regretting. "Are you scraping the mat to pieces? You've eben there long enough to let the supper get cold."

"I've brought Jeffrey Blake with me, Ernestine," said Ralph, with the hint of an apology in his voice. "I ran across him just as I was boarding my train."

Jeffrey's watchful eye detected the flash of anger Ernestine sent her husband before she turned and shook hands with him. The meeting he had been looking forward to and dreading for four years was prosaically over. So this was Ernestine as a wife—the woman who he thought had spoiled all other women for him. As he sat in the proper parlor while Ernestine made hurried changes in the supper, evidently necessitated by his presence, he heard her shrill voice railing at Ralph, who had gone to the kitchen to offer his services.

"Rule 3 says that you're never to bring company without my consent," she nagged. Ralph's reply was inaudible. "Don't sit there looking at me. It's enough for you to bring home company and making me a lot of extra work without sitting there watching me and making me nervous!" There was a movement as though Ralph were coming to join his guest, but again came the disagreeable voice. "No, you needn't go in there. Cut some more bread—thin, mind you, and don't get crumbs all over everything."

Jeffrey shifted uncomfortably in his chair. Could this be the adorable, primly perfect little Ernestine? Suppose he were in Ralph's shoes. And he so easily might have been! The querulous voice rose higher.

"Hang it! I can't stay here," muttered Jeff, starting for the door leading to the porch.

Just then Ernestine appeared to announce supper. She carefully set in place the chair Jeff had just vacated, straightened a rug and folded the paper he had tossed aside before she led the way to the table.

The supper was excellent, but it was not an enjoyable meal. Ralph splashed a speck of gravy on the fresh cloth, which brought forth a horrified exclamation from Ernestine. Jeffrey was awkwardly uncomfortable, fearing a like mishap, with the result that he upset his cup of coffee. He longed to get up and run. He wondered how he could spend an evening in this home. Home? Prison—house of correction, rather. At the thought a whimsical smile twisted his face.

But relief came. It slammed in through the front door in spite of Ernestine's "It's muddy! Go to the back door!"

"I will not!" replied a ringing voice. "I never expect you to go to my back door, and I won't go to yours. Hello, Ralph! Why——" the color slowly receded from the girl's face, and then flooded it full tide—"It's Jeff!"

Gleams of mist glistened on the hair that was still as frowsed and stubborn as Jeff remembered it of old. Her blouse was loose and fell away from a brown throat; her shoes were thick soled, low heeled—as great a contract as ever to the immaculate Ernestine, he thought as he greeted her.

"You know my rules, Cis, and yet you track up the front way with your muddy feet," complained Ernestine, still full of her grievance.

"I don't give a farthing for your rules, and my feet aren't muddy. I just came over for a second, so don't try to 'rule' me, Ernestine. I want to know if you will come to my house tomorrow to help sew on soldiers' things."

"Tomorrow's my sweeping day, and I want to start on a silk dress for myself. You know I never let anything interfere with my own work."

"Then, I'm off. I've got a stack of work ahead of me tonight. There's so much real work for us women these days that I'm trying to get rid of my little personal tasks in the evening so as to leave a big chunk of the day free. It's good to have seen you again, Jeff. Goodnight, all!"

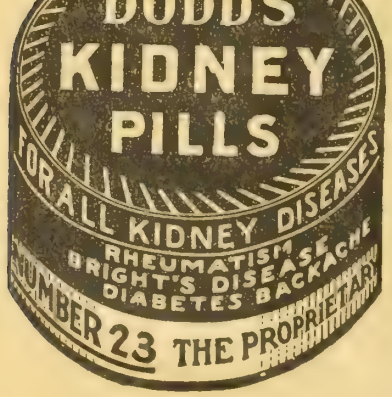
"Not so fast!" cried Jeff. "I've got to be going, too, so let me walk on with you."

"For heaven's sake tell me what are the rules?" he asked, drawing a long breath as he put her gloveless, calloused little hand under his arm. "I'm fed up on them. Am I dreaming or are they real?"

"They're real enough," replied Cis. "To begin on, Ralph was careless around the house, and he never would remember what Ernestine told him. That's how the rules started, and she's threatened to leave him if he doesn't stop breaking them."

"Which would mean a chance for him to get away from that house of correction! Must make him feel bad," laughed Jeff.

Cis giggled. "You've been their guest and you shouldn't call names,



Able to Start Work Again

Trouble Was Easily Removed

Don't be discouraged if you find that you have Kidney or Bladder troubles, and don't imagine your case is hopeless or that you will be crippled and suffer all the rest of your life.

Here is good news: Gin Pills have restored thousands of sufferers to health and strength. What they have done for others they will do for you.

Read what Mr. J. Harrop says:

"I have been crippled up so completely that I could not stand. Work was out of the question. A few doses of Gin Pills put me right. I cannot praise Gin Pills too much, and every home should have a box."

Mr. Harrop's experience with Gin Pills has been the same as thousands of others, in all parts of this continent.

Take the case of Mr. B. Milford, Galetta, Ont. Mr. Milford had been troubled with backache and kidney trouble for so long that his wife determined to find a remedy for his affliction. Having become convinced that Gin Pills were what he needed, she persuaded him to commence treatment with this well-known remedy. He did so, and surprising results were obtained almost immediately.

This is an extract from Mrs. Milford's letter:—

"After one dose of Gin Pills my husband found them to be exactly what he needed, and after taking two boxes he was completely cured."

Cases like these prove the value of Gin Pills. Try them. 50c a box at all dealers. 171

Dear Sire,—Your traveler is here today and we are getting a large quantity of your MINARD'S LINIMENT. We find it the best Liniment on the market making no exception. We have been in business 13 years and have handled all kinds, but have dropped them all but yours; that sells itself; the others have to be pushed to get rid of.
W. A. HAGERMAN.

Jeff. Truly Ernestine was so sought after before she was married that she never dreamed she might make a man so miserable that her going would be a relief. I don't say that it would be for Ralph. He was certainly in love with Ernestine and you were just crazy about her yourself."

"'Were' is right," said Jeff.

"Ralph needs a sympathetic wife," she went on. "He's not awfully strong. There ought to be a restful living room full of worn easy chairs hollowed into shape from much sitting in them and soft lights and a table strewn with books and papers and children around. He adores them, but Ernestine thinks they're too much trouble and get a house too dirty! I oughtn't to talk so, but I do get worked up when I see what Ernestine's doing to Ralph!"

"And what if a fellow brought home unexpected company on a muddy night?" asked Jeff.

'Well, what if he did? Is it the woman's home alone? She has company when she wants it. The days are hers. Why can't she let the husband have the evenings? Lighted windows and open doors offering to share the home spirit is what I'd want in my home!"

"Oh, Cis, I see the gleam of such a great happiness ahead of us that is makes me tremble," whispered Jeff, as he squeezed the calloused little hand.

THE KNITTING PARTY THE BOYS GAVE

The invitations were written to the girls of another class in rime:

Come one, come all, who knit, knit, kni
Come one, come all, who knit, knit, knit
At eight o'clock, that's it, it, it.
There'll be nothing to do but sit,
And knit, and knit, and sit, and knit.

Perhaps because there is a great charm in a living picture of a girl plying a domestic art—and she knows it—every girl accepted.

Musical numbers entertained the girls the first part of the evening. Each boy who did not chat with every girl for at least three minutes was to be fined. (This was not known to the guests, however.) That one little rule was instrumental in making the party very pleasurable to the unattractive or bashful girl. No one was left out. Everyone felt at home.

Knitting was finally interrupted by a motion-picture play with living characters produced by the boys at a folding doorway.

As a fitting end to such industry, the girls were then ushered to the dining room, where refreshments were so light that they were entirely consistent with Hooverizing. Place-cards were crosses made of red cardboard, edged in gold and printed in gold ink. Besides the name, on some were subjects for extemporaneous toasts, giving local applications to war terms: "Mobilization—When the Class Gets Together"; "High Explosives—Quick Tempers"; "Peace Treaty—The Golden Rule."

So industry was combined with society. Little time and money (both so precious now) were spent, and yet no evening could have been more successful.

CARE OF THE BROOM

"A good broom lasts me a year," said a farmer's wife to the editress, who was visiting her home quite recently. "In the end of the handles of my brooms I place a screw eye so that the brooms may be hung up instead of thrown into some corner. Every week the broom has a bath in the boiler after the clothes are boiled, and is then hung up to dry. This toughens the straw. Sweeping with a dry broom breaks the straws, and if hot water is poured over the broom and it is set aside a few minutes to absorb the moisture, the sweeping is much easier, for the broom is pliable and does not cause a heavy dust. After the sweeping is done the broom is again rinsed with hot water and hung up until the next time. It pays to buy a good broom and with proper care it will last a long time. Sometimes a broom is throw away when it is one-sided, or has a 'tail;' instead, it could be dipped in hot suds, laid down or hung up to dry and then would be as good as ever. It may even be trimmed very easily with the scissors or with a knife and a board."

CARE OF LAMPS

The care of lamps is the bugbear of many a woman's life. But with a little care at the proper time, and a few precautions, lamps may be kept clean and free from odors, and a perfect light be the result, and that with little trouble. By observing the following rules a good light will be insured.

Keep a piece of flannel or a few woolen ravelings in the container to collect the sediment in the oil.

Fill daily with the best grade of oil, leaving a little room for expansion when the oil becomes warm.

cause of odor is the clogging of the

Keep the burner clean. The common tiny holes in the base of the burner under the cap, and the crust which forms on top of the wick.

Have a good wick and be sure it fits. Trim the wick daily, cutting off the burned portion, and slightly rounding the corners.

Replace the wicks as soon as they become dirty. Wicks may be washed and dried and used again if not too short.

In extinguishing a lamp blow sharply across the top, and not into the chimney, and thus avoid smoking up the chimney. And if all this seems too much trouble remember that there is nothing that adds so much to the comfort and cheer of the home as well cared for lamps.

APTNESS IN GREETING

There is a lot of aptness needed in greeting friends and happy is the woman who has learned the pleasure in making people feel good instead of hurting their sensitive natures. If your friend wishes you to pass judgment on her size, the becomingness of her costume, or the peculiarity of her walk, she will make her wishes known, without your bluntly giving judgment at first greeting. This would be a very funny world, anyway, if all women were the same size, had the same color hair, the same type or beauty or weighed the same amount. It is an old saying when things are similar that they are as near alike as "a row of peas' and yet very few pods are opened that do not show some difference in their contents, the peas at the end of the pod often being slightly smaller and inclined to "shrivel."

If women would only learn that it is very impolite to begin to refer to one's personal appearance or adornment the minute the handshake begins, there would be a lot more true friendships.

MANICURING AT HOME

Whatever else you neglect, do not neglect your hands. Dont' argue that you have to do all the housework, and you can not cut your own cuticle and other ancient excuses. All of us have to peel potatoes and wash dishes and scrub pots this year, but when you get through this three-times-a-day task, rub into the hands and nails a little cold-cream from a jar that ought to be kept over the kitchen sink. Then wipe them dry.

Home manicuring in these days is far more simple and easily accomplished than making cake without sugar or bread without wheat flour!

Of course, no one attempts to cut their cuticle any more. It was never done successfully at home, always leaving ragged edges, which meant hang-nails and consequent annoyance. Nowadays you use a cuticle remover. You simply wrap a piece of absorbent cotton about an orange stick, dip it in this liquid and in a few minutes you can rub away all the excess cuticle which has grown about the base of the nail. No scissors are necessary and no hang-nails are possible. You can get a little home manicuring outfit for about a dollar that will answer almost every purpose. And by spending ten minutes a day on your hands and nails you will get a better and more permanent result than by neglecting them all the week and then spending an hour on them all at once.

When your work is done for the afternoon, and again when you are ready to sit down after the evening's meal is over, rub a little paste on the nails and polish with a buffer on which you have rubbed some of the nail-powder which comes in all manicuring sets.

If you rub each nail twenty-five times you will have a beautiful polish. Do this in your spare time every day and keep ugly hands away.

Mary, from the city, watched the farmer's wife plucking the duck for the morrow's dinner. Mary was interested in farm life. "Please, ma'am," she asked, "do you take off their clothes every night?"

HER LITTLE GIRL
COUGHED UNTIL
SHE FAIRLY CHOKED.

Mrs. John Reinhardt, Ridgetown, Ont., writes:—"My little girl at the age of a year and a half old had an awful cough. She would cough until she would fairly choke, and I was afraid it would go to her lungs. I thought I would use Dr. Wood's Norway Pine Syrup, as I knew of quite a few persons who had used it with good results. I am glad I did so, as I only used one bottle. It is a sure cure for coughs and colds."

There is no reason why Dr. Wood's Norway Pine Syrup should not be recognized as the very best cough and cold remedy on the market to-day, combining as it does the lung healing virtues of the Norway pine tree, to which are added wild cherry bark, squills, and other soothing and healing pectoral remedies.

It has stood the test for the past 30 years and is becoming more generally used every year on account of its great merits in curing coughs, colds, bronchitis, croup, whooping cough, asthma, sore throat, and preventing pneumonia and in many cases consumption.

So great has been its success that there have been a great many imitations put on the market to take its place. See that none of these so-called "pine syrups" are handed out to you when you ask for "Dr. Wood's." The genuine and original is put up in a yellow wrapper; three pine trees the trade mark; price 25c. and 50c. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.
Address
MRS. M. SUMMERS, Box 309
Windsor, Ont.

A NERVOUS WRECK

FROM HEART AND NERVES.

There are many people at the present time whose nerves are unstrung, heart affected, and general health impaired.

To such we offer Milburn's Heart and Nerve Pills as the best remedy that science has produced for such troubles. These pills have a wonderful effect on the nerve cells of the body, giving them new life and energy; they strengthen and regulate the heart and make the blood rich and nourishing.

Mr. Joseph Daly, Wolfe Island, Ont., writes:—"I have used Milburn's Heart and Nerve Pills. I was a regular nervous wreck from my heart and nerves. I saw your advertisement in the paper and decided to try your pills. I took five boxes of them, and now I am as steady as a clock.

People said I could not be cured, but I fooled them with Milburn's Heart and Nerve Pills."

Milburn's Heart and Nerve Pills are 50c. a box at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

IRONING DAY MADE PLEASANT

Quick, easy ironing requires a well-padded board that stands as firm as a rock. Several thicknesses of old blanket or heavy canton Flannel make it easy to produce a smooth surface on the garments with little expenditure of strength. REMEMBER that well padded boards reduce work.

Almost every housekeeper knows the usefulness of a pad for making embroidered work look its best. A long Turkish towel folded double over this pad makes fine lawn and muslin gowns with trimmings of embroideries and lace come from this surface beautifully and easily ironed.

The tedious task of ironing between the buttons of waists is quite done away with in this way too; just one passing of the hot iron over the waist as it lies on the pad button side down, is all that is necessary.

The dainty girl who loves just the suggestion of perfume about her clothes, gets a great deal of satisfaction from a little powdered orris-root, sprinkled between the folds of the towel on which her cloths are pressed. The fragrance imparted in this way is delightfully sweet and dainty.

A well-padded sleeve board is a great help in ironing gowns, the appearance of which depends so much upon the sleeves.

In families in which the weekly wash contains many skirts, a skirt board is a necessity; and a shirt board too if there are lots of those articles. Women who have to make a long narrow board do service in ironing short sqatty things like shirts welcome the shirt board too. It is well to have a boar dthe exact length of the skirts to be iron, rather than use a too short one and iron the skirt in relays.

How to Pad the Boards.

The lack of these two things so easily and inexpensively supplied has made many a housekeeper dislike this work, and left her exasperated and cross after doing it. Each board should have two covers to be used on it alone. When one is taken off to be washed ti should be replaced by the other, so that the board will always be ready for use.

Padding should be tacked to the other side to prevent the cover from wrinkling under the action of the iron. All the edges are hemmed and small brass curtain rings are sewed at intervals of three inches all the way around. About six inches from the right end of the board, on the upper side, round headed brass tacks are driven in nearly as far as they will go. Enough space is left between the tops and the board so that the rings meant to be slpiped over them will be held in place. On the other side is a similar tack to which is fastened a stout cord. The right hand end of the cover is adjusted over the tacks. Then this cord is laced back and forth through the rings on the long sides of the cover and at the remaining end, and when all is properly adjusted and the upper side smooth, the cord is pulled tight and securely tied underneath the board.

Have Clothes Bars at Hand

For 15 cents you can buy a little device designed to sprinkle cloths evenly, and for less than that a whisk broom that will serve two purposes—that of dampening the clothes and also pulling out any fringe before ironing.

Clothes bars will cost you more than either of these two articles, but as they save many steps, should be found in every household. These bars should be placed at the left of the ironing board, with the basket of dampened clothes so near that with one motion the ironer can hang up the ironed garment and take up another to iron.

Wear your ironing apron while ironing. In the pocket have buttons and a spool of thread, and a threaded needle under the board. If for any reason you have to wait for the iron to heat, you can sew on a few buttons or mend a bit of embroidery.

"Copied from April, 1913 Women's Magazine."

He Says He Owes His Life to Them

NEW BRUNSWICK MAN'S TRIBUTE TO DODD'S KIDNEY PILLS

After Years of Suffering Mr. George Rabits Tells How He Found Relief in Dodd's Kidney Pills.

Upper Rexton, Kent Co., N. B.—Oct. 20th (Special).—"I believe that only for Dodd's Kidney Pills I would be dead."

That statement is made in all sincerity by Mr. George Rabits, a well-known and respected resident here. And those who know the suffering he has endured are not surprised that Mr. Rabits is so enthusiastic in his praises of Dodd's Kidney Pills.

"I suffered greatly from urinary trouble," Mr. Rabits says, in speaking of hi stroubles. "I had cramps in my muscles, and when I worked all day I hardly knew how to sit down at night.

"I could only get to sleep for a little while at a time, and then I had all kinds of bad dreams.

"I was weak and nervous, with a heavy, dragging feeling across my back. I could see specks floating in front of my eyes, and I was often dizzy.

"I tried doctors, but there was no help for me, so I tried Dodd's Kidney Pills. I have used about twenty boxes, and I am almost cured. I think they are the best medicine I have ever struck, and my wife finds them a wonderful pill. She says she will never be without Dodd's Kidney Pills."

Mr. Rabits' troubles all came from his kidneys. If you have any one of them, try Dodd's Kidney Pills, or ask your neighbors about them.

PEAS FOR WINTER DINNERS

Few experiences are more exasperating to a housewife than, after putting away dry peas for winter use to find worms and weevils have already dined so well that what is left is unfit for use.

Perhaps this may prove a remedy, as one woman found it very successful. After shelling the peas, pick out all those which have black spots on them, as these indicate peas containing the germs of either weevils or worms, and probably both; also the broken ones, then fan out chaff as cleanly as possible. Pour in shallow pans and set inside the stove with the damper turned to throw the heat on the bottom, and keep them there for thirty minutes at a temperature hot enough to bake bread. Every ten minutes the pans must be shaken in order to heat them evenly and prevent those on the bottom from scorching.

Clean glass fruit jars, wipe dry, and set on the front of the stove to become heated, while the peas were in the oven. At the expiration of the thirty minutes pour the peas in the heated jars, and seal as in canning fruit or fresh vegetables, always using new rubbers.

This process will not render the peas more difficult to cook. An hour of steady boiling will reduce them to mealiness. Like any other dry vegetable, however, they require from three to four hours of soaking before being cooked. This method is not only easier than canning fresh peas, but calls fo rfewer containers, as dry ones are less bulky.

CUT THIS OUT

Paste on a neat sheet of paste board, and hang it in your kitchen near the work table.

Handy Measures

One small teacupful flour equals about ¼ lb.;

One small cupful soft sugar equals about ¼ lb.;

1 small cupful sifted sugar equals about 0 oz.;

1 small cupful grated cheese equals aout 3 ozs.;

1 small cupful breadcrumbs equals about 2 ozs.

1 tablespoonful flour equals about 1 oz.

1 desertspoonful butter equals about 1 oz.

½ pint of liquid equals about 1 breakfast cupful or 2 small teacupfuls.

4 teaspoons liquid equals 1 tablespoonful.

3 teaspoons dry material equals 1 tablespoonful.

4 teacupfuls equals 1 quart.

How Much To Use

Use 1 teaspoonful soda to 1 pint sour milk.

Use 1 teaspoonful soda to 1 cup molasses.

3 teaspoonfuls baking powder (level) to 1 quart of flour.

½ cup yeast or ¼ cake compressed yeast to 1 pint liquid.

1 teaspoonful extract to 1 loaf cake.

1 teaspoonful salt to 2 quarts flour.

1 teaspoonful salt to 1 quart soup.

1 scant cupful liquid to 2 full cups flour for bread.

1 scant cupful liquid to 2 full cups flour for muffins.

1 scant cupful liquid to 1 full cupful of batters.

1 quart water to each pound of meat and bone for soup.

JELLY PULP

Don't throw away the pulp left in the jelly bags after the clear juice has drained out, says the United States Department of Agriculture. Although federal laws prohibit the use of this substance for commercial purposes, because it might masquerade as a whole-fruit product it is thoroughly wholesome, and there is no reason why it should not be put to family use. Fruit paste, for instance, is a most satisfactory product that can be made from the fruit pulp.

Fruit paste is a type of confection or dessert and may be made from apricot, quince, gooseberry, apple cherry, plum, kumquat, guava and other fruits. For apricots, gooseberries and other acid fruits use I pound of powdered sugar to 1 pound of fruit pulp; for quince use ¾ pound powdered sugar to each pound of pulp; and for apples ½ pound powdered sugar for each pound of fruit pulp. If desired, pulp from several kinds of fruits may be mixed. If acid fruits predominate in this mixture, use approximately 1 pound of sugar to 1 pound of fruit mixture; if sweet fruits predominate, use less sugar.

Rub the fruit pulp through a puree strainer and weigh it. Add the sugar, put the mixture over a slow fire, and cook until it is very thick, so that when a spoon has been passed through it the mass does not run together immediately. Pour the paste in a half-inch layer on flat dishes, marble or glass slabs, which have been rubbed with a cloth dipped in a good salad oil. Expose the dishes to draft for a couple of days and then cut the paste into figures. If the paste is well boiled down, it is dried more easily. The paste also can be cut with a common knife or with a fluted vegetable knife, or it can be cut in round cakes, the

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

A MESSAGE TO WOMEN!!

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:

Rheumatism Entirely Gone

After Twenty-Seven Years of Suffering—Swelling and Puffiness Has Disappeared—Not a Pain or an Ache Left

A most astonishing cure of rheumatism and eczema has eben reported here, and Mrs. Ray is enthusiastic in telling her many friends how cure was effected.

Rheumatism and eczema frequently go together, and in this case caused the most keen distress imaginable. All the swelling and puffiness resulting from many years of rheumatism have disappeared, and there is not a pain or an ache left.

Mr. G. H. Ray, R.R. No. 1, Kincardine, Ont., writes: "Mrs. Ray has been using your Kidney-Liver Pills. She was very bad with rheumatism and eczema, and had had that fearful itch for twenty-seven years. It was simply terrible what she suffered. I persuaded her to try $1.00 worth of Dr. Chase's Kidney-Liver Pills. She is now on the last box, and let me tell you she scarcely knows herself, she is so free from both these diseases. All the swelling and puffiness caused by the rheumatism has gone away, and she has gone down in weight 18½ pounds. She never has an ache nor pain, biliousness nor sick headache all these months. She often says herself 'How glad I am that I know what to do instead of paying doctors so much to make me worse.'"

There is only one way that the poisons in the blood can be cleaned away and the cause of pains and aches removed, and that is by the healthful action of the kidneys, liver and bowels. Because Dr. Chase's Kidney-Liver Pills act directly and specifically on these organs and insure their activity they remove the cause of rheumatism and other dreadfully painful and fatal diseases. One pill a dose, 25 cents a box, all dealers or Edmanson, Bates & Co., Limited, Toronto.

Look for the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author, on the box you buy.

center of which is again cut with a smaller circular cutter; there will thus be both rings an dsmall round cakes.

SANDWICHES FOR WAR TIME

The following recipes for sandwiches may be found useful in preparing the "basket" for the picnic or the school lunch basket. Be sure to wrap them in waxed paper or a napkin rung out of water. This will keep them fresh and attractive.

Use brown bread for the substantial portion, with any of these fillings:

1. Hard boiled eggs chopped, seasoned and well moistened with melted butter and vinegar to which a speck of mustard has been added.
2. Baked beans mashed smooth and mixed with salad dressing.
3. Flaked fish and chopped cucumbers with salad dressing.
4. Chopped peanuts and banana pulp, with a little lemon juice or salad dressing.
5. Minced celery and apple mixed with salad dressing.
6. Chopped nuts of any kind, well moistened with salad dressing.

Put lettuce leaves between also.

7. Cooked and pulped figs or prunes.
8. Jam or orange marmalade.
9. Creamed cheese alone or mixed with chopped nuts.
10. Lettuce, cress, sliced cucumbers or tomatoes, with plenty of good salad dressing.

CURED HIS RUPTURE

I was badly ruptured while lifting a trunk several years ago. Doctors said my only hope of cure was an operation. Trusses did me no good. Finally I got hold of something that quickly and completely cured me. Years have passed and the rupture has never returned, although I am doing hard work as a carpenter. There was no operation, no lost time, no trouble. I have nothing to sell, but will give full information about how you may find a complete cure without operation. if you write to me, Eugene M. Pullen, Carpenter, 5543 Marcellus Avenue, Manasquan, N. J. Better cut out this notice and show it to any others who are ruptured—you may save a life or at least stop the misery of rupture and the worry and danger of an operation.

THE MOUTH THAT SMILES

You can keep father time at bay a long time with a smiling mouth, and you can add necessary years with a drooping mouth.

The expressing of whole face is old, unhappy and ugly. Then smile without showing the teeth. Don't you look years younger and far more attractive?

Some people possess this capacity naturally, but anyone can make an attempt to cultivate it.

The aging lines about your mouth are purely habit. You allow the muscles around your mouth to sag through indulging in discontent and ill temper.

Everyone can feel without consulting the mirror, when the mouth is drooping and then is the time to correct the downward curve of the muscles. Curve the lips upward in a smile. Then damp fix a piece of plaster cut the shape of a half moon, on either side of the mouth.

Leave them in this position for several hours, if worn during the day, or they can be applied at night and left on till morning whichever is most convenient.

WHEATLESS LAYER CAKE

¼ cup oleo, ½ cup sugar, ½ cup corn syrup, 2 eggs, eaten separately, 1 cup milk, 5 teaspoons baking powder, 2 cups barley flour, ½ cup rice flour, 1 teaspoon vanilla.

Cream oleo and sugar together. Add syrup and beaten egg yolks. Sift dry ingredients and add alternately with the milk to the first mixture. Fold in stiffly beaten egg whites last. Bake in two layer cake tins in a moderate oven for twenty minutes. Spread with currant jelly and sprinkle with cocoanut.

BARLEY COOKIES

1 egg, ¼ cup melted fat, ¼ cup milk, ½ cup molasses, ¼ cup brown sugar, 1½ cups barley flour, ½ teaspoon soda, 2 teaspoons baking powder, ½ teaspoon salt, 1¾ cups bran, 1 cup chopped nuts or raisins.

Beat egg, add fat, sugar, molasses and milk. Sift dry ingredients together and add. Beat well, stir in bran and raisins. Drop from tip of spoon into greased pans. Bake in moderate oven about fifteen minutes.

CREAM SPONGE CAKE

2 eggs, ½ cup sugar, 1 tablespoon cold water, 3 tablespoons corn starch, 1/3 cup flour, ¼ teaspoon salt, 1 teaspoon baking powder, 1 teaspoon lemon extract.

Separate egg white and yolk. Beat yolks until light colored, add sugar and continue beating for three minutes, then add water. Sift flour, salt baking powder and add to first mixture. Fod in stiffly beaten egg whites last. Bake in moderate oven about thirty minutes.

WHEATLESS COOKIES

1¼ cups corn syrup, 1/3 cup fat, 1 egg, beaten, ¼ cup milk, 1½ cups corn flour, 1 teaspoon salt, 3 teaspoons baking powder, ½ cup chopped nuts or raisins, 1 teaspoon flavoring.

Cream fat and work with the syrup until smooth. Add egg, milk, then sifted dry ingredients. Stir in nuts and flavoring last. Drop from teaspoon on greased pan, about two inches apart. Bake in moderate oven about twelve minutes.

FASTENING KNIFE HANDLES

To make loose knife-handles fast, fill the cavity in the handle two-thirds full of resin and powdered bath-brick mixed. Next heat the shaft of the knife until very hot and press into the handle. The resin will solidify and when it hardens the handle will be firm.

CARROT CARAMELS

1 cup grated raw carrots, 1 cup corn syrup (crystal) 1 cup sugar, 1 teaspoon vanilla, 1 tablespoon butter, ⅛ teaspoon salt, 2 squares chocolate, grated or cut fine.

Mix all ingredients except vanilla. Heat slowly until sugar is dissolved, then boil until a little of the mixture forms a firm ball in cold water. Remove from fire, ad dvanilla and pour into a well-oiled pan. Cut in squares when cold. The mixture will be very thick when it is ready to take from the fire and must be stirred continually to prevent its burning.

TIMING AN OVEN

Set the alarm clock to go off at the time bread or cake should come out of the oven,—that is, if you are very forgetful and subject to burning things.

An old boiler may be made to serve as an oven on the oil stove. Place it on its side, place the article to be baked in it, then put on the lid.

Knit Socks and Dollars with the Auto Knitter

Profitable employment at home in war or peace time

Socks—more socks—the Soldiers' call! The hosiery industry is booming and the demand far exceeds the supply. Help us fill it but get away from slow hand knitting. Use the fast, reliable, modern Auto Knitter. We gladly take all the socks you wish to send us and pay you highly profitable prices.

The Auto Knitter is simple and easily learnt—and secures a big income for full or spare time work right in your own home and no previous experience is essential.

Write today for full particulars enclosing 3c stamp. See what good money you and your family can earn at home besides doing patriotic work.

BE CHEERFUL AT MEAL TIME

What do you talk about at the table? Women too often make the dinner table a dumping ground for all their woes. Other times it becomes a sort of inquisition and stocks for the children. They are cross-examined, threatened and scolded. That's a very common form of meal-time conversation and it's a shame that it should be so.

The dinner table should be positively the last place selected for fault-finding and scolding. Even in the matter of training in civilized procedure with table tools there are more effective a swell as pleasanter methods for making the children conform than nagging. Try a series of rewards. or if that doesn't work, have the offender leave t hetable, or deprive him of a treat. Do it firmly and without calling attention to his lapse and making it a topic of conversation.

It takes a little effort to refrain from the woeful or unpleasant in conversation. And practice is required to enable you to switch the subject when it seems inclined to stick to horrors. No good comes of dwelling on the war and the horrors it is bringing to so many. The tragedies will have to be borne with the best grace possible. Depressing yourself and others by gloomy talk isn't playing the game fair.

It would be real patriotism if every young married couple would resolve from the very beginning to cutivate a cheerful atmosphere at meal time. Whatever makes life in the community finer is genuine patriotism. Just at first it would not be so difficult, probably, and once the habit is firmly established it will hold under the strain o fthings gone askew. The minor tragedies and tangles will have to be talked out some time, and the interlude of a cheerful meal will help to smooth them out.

The habit of pleasant talk at the table and postponing unpleasant matters until irritated nerves and tired muscles have been soothed and rested by food and a calm atmosphere would stave off a great many family jars and make home a place of pleasanter memories than is usually the case. And it would add immensely to health and happiness.

COMMON ACCIDENTS OF YOUNG CHILDREN

Accidents are so common among young children that mothers should make it a point to become well versed in first aid remedies.

Wounds—Whenever the flesh is broken it is wise to apply tincture of iodine as soon as possible to the break if the wound is small and then to cleanse the part with clean boiled water. Washing out the part first with hydrogen peroxide or water is a bad plan, for germs from the surrounding parts are likely to be carried into the depths of th ewound or cut.

In large cuts, wounds, or burns the importance of keeping the injury clean and free from germs is even more urgent. The clothing should be cut away from the injured part and the wound exposed to the air. After the bleeding is controlled by means of pressure on the adjacent blood vessels the wound may be covered by a sterile dressing or left exposed to the air, which cannot injure it, until the dressings are prepared. Such an injury must be handled as little as possible until the hands of the attendant can be sterilized by scrubbing them with hot water, soap, and a scrubbing brush for five minutes and then soaking them several minutes in an antiseptic solution.

Bumps and Bruises.—These are perhaps the commonest injuries which young children receive. A slight bruise ordinarily requires no treatment, and is forgotten in a few minutes, although the discoloration of the skin may remain for some time. If the injury is more severe, cloths wrung out of very cold or very hot water. or cracked ice wrapped in a cloth, may be applied to the bruise. Either alcohol or witch hazel, each diluted wtih water may be used upon a bruise. If the skin is broken it should be treated as a wound.

DRY CLEANING DONE AT HOME

Dry cleaning done by a professional cleaner is expensive, much too expensive for the length of time any dry-cleaned garment stays clean. But the thought of doing it at home immediately suggests gasoline, always dangerous and of a fragrance that lingers most astonishingly. But there are many cases where cleaning can be done quite as well with something else. The materials required are very simple—fuller's earth, block magnesia, goracic talcum powder, flour and borax, or even plain corn meal. The first three can be bought by the ounce or pound from any druggist, and the others are always in the pantry or store chest.

For a white suit or gown it is perfectly safe to use either the meals or talcum powder. A white serge suit can be successfully cleaned by putting it into a dry, clean tub and cover it over with corn meal slightly salted. The suit can be rubbed with the hands exactly as if it were in soap suds, the most energetic rubbing naturally being given to the spots which are most soiled. After it has been thoroughly gone over, the meal should be thrown away and the suit covered with clean meal. It should be left there for two days with a cloth over the tub to keep out the dust, and then shaken out and brushed with a perfectly clean brush.

For finer materials, such as silk or cashmere, it is better to use flour and borax, mixing one-quarter of a pound of the borax with a pound of the flour. In this case the material should not be rubbed with the hands, but with a soft. clean brush—one of the little wooden-backed face brushes that can be bought at any druggist's would do very well. Rub very thoroughly over the entire garment, then shake all the loose powder out and rub the garmnt again with clean powder. Leave this on for three days and then shak: the garment and beat out all the powder. If the work has been thoroughly done it will look as it did when new.

When it comes to delicate laces it is better to use the boracic talcum pow-

Ranges, Furnaces, Stoves, Utensils, Implements

The Smith Foundry Company, Ltd.
FREDERICTON, New Brunswick

"Unto the least of these"

RIVET your eyes on this picture of a Belgian mother and child, until you feel the full horror of the situation! Thousands of these orphans, dying of starvation, might now be living in comfort and plenty, had their soldier fathers not flung themselves into the breach when the Hun invaded Belgium.

The fathers died to save us. Are we going to let the orphans starve?

Conditions are simply ghastly. The United States loans to the Belgian Government finance the general relief work, but this only provides a bowl of soup and two pieces of bread to each person per day.

What is that for a growing child?

The Slaughter of the Innocents is less terrible than what is now occurring in Belgium—practically a whole generation of the Belgian nation in the grip of Consumption, Rickets and other ills all directly due to insufficient nourishment.

The Canadian Bureau in Brussels will administer funds, and provide means for getting the ailing children into Holland and into orphanages where they can be saved from a hideous death.

Before you sit down to another meal, do SOMETHING for the Belgian children. . . . . .

Make cheques payable and send contributions to

Belgian Relief Fund

(Registered under the War Charities Act) 115

Headquarters: 59 St. Peter St., Montreal.

der. The lace should be pinned to an ironing board, covered with a clean sheet, and the powder rubbed in with a new tooth brush. The lace should be turned over and teh work done very carefully and thoroughly on both sides. After all the brushing in is done, cover the lace with fresh powder, shield from the dust and leave it for two days. It will then be ready to shake out and press.

BEGINNING RIGHT

Sometimes I hear mothers asking what to do with a child who has a serious fault of one kind or another. Now we all know that no mother can make a child perfect, but I have often wondered if we could not do better by beginning right at the beginning of things. It seems hard to be severe with a tiny child, but even if severity is necessary, is not a little bit of it at the right time better than a great deal of it later, or better than a great deal of fault in the child? Just firmness will often do in the beginning what severity will not accomplish later.

A lady I know very well would now and then spank her baby daughter, and justified herself with this argument, "If I get her into the habit of obeying me before she is two years old, she'll have the habit, but she won't remember the spankings, for I mean to get past them before she is old enough to remember. It will save no end of friction in the future." Results proved her wisdom, too, for though her daughter was not a marvel of perfection, she was manageable all the way along, and was not unendurable because of a too prominent fault.

Another mother who was too tenderhearted and somewhat careless withal, was often heard saying of her six-year-old son, "I cannot keep him at home half the time. He will go where he pleases, and I never know whether I'll find him." When that son first began to run about the piazza and yard the mother would sit absorbed in a book or conversation, not knowing where her baby was; he often wandered entirely out of sight. When she awoke to the situation there was a hunt, a great- to-do, but nothing more. Now, it seems to me that if that mother had been more vigilant and known where the child was and what he was doing, and had been ready to arrest him with a positive "No, no," and turned him back every time he reached the boundary line at the first, he would have formed th habit of obedince and of accepting limits.

In a certain family is a girl who never of herself gets ready in time for breakfast, for school, for doing an errand. Because of this habit she is a constant storm center, a very cyclone brewer in the family. She is really a normal child, and I am sure that if the mother had begun with her as soon as she saw signs of that special failing and given thorough treatment, the girl would have been saved from having the habit so fixed, and would have been spared some very unpleasant experiences.

I think this way about beginning well: thought it may seem a little hard for a tender bady, yet it's like putting a straight jacket on a crooked back, o ra brace on a crooked ankle—not so pleasant at first, but useful for future results. A right beginning is like sowing a little wisdom and thought and vigilance now that will bring forth many fold in the way of right habits and peace in days to come. "As the twig is bent, the tree is inclined" the old-fashioned people say. Straighten the twig now, when it can be done without a serious wrench, and the tree will grow straight.

CLEANING SOILED RAINCOAT

Choose a fair day, so that the work may be done out-of-doors. Dip the coat in cold, soft water, and spread out on a large board or table. Scrub well with a stiff brush, using soft water and white soap; when thoroughly cleaned, dip the coat several times in clear water until all suds are removed. Do not wring, but hang in the air to drip dry.

If for the past four years you have enjoyed home comfort while others have been fighting on the battlefield, shew now your keen appreciation by buying
VICTORY BONDS
TO YOUR LIMIT
CANADA MUST HAVE MONEY TO WIN THE WAR
KING COLE TEA
"YOU'LL LIKE THE FLAVOR"

A STOCKING SUGGESTION

All mothers know how hard it is to keep Jane's and Johnny's stockings drawn up tight and smooth over their winter underwear. I have solved the problem successfully by sewing a piece of inch-wide rubber banding to the leg of the drawers, in such a manner that it passes under the child's heel like a legging strap. This holds the drawers firmly in place, and stockings fit over them easily.

TO CLEAN LARD

When rendering lard in the farm kitchen I peel and slice raw potatoes and after the lard is put through a coarse meat grinder, add and cook slowly till the potatoes rise to the top. The potatoes clarify the lard and absorb the water quickly and there is little danger of burning the lard. It is done in less than half the time and is purer and whiter tha nwhen clarified by the old method.

Also the drippings of bacon and ham can be clarified in the same way, and can be used for frying doughnuts.

One pound of cottage cheese will supply as much nourishment as 1 pound of meat or 1 dozen large eggs. Use it at breakfast, luncheon, dinner or supper.

RHUBARB MARMALADE

1 qt. canned rhubarb. Skin of 4 oranges. Sugar. Add the skins of oranges cut into small pieces to the rhubarb, and sugar to taste. Cook until it measures half or about a pint.

MUSH BREAD

This ercipe is very highly recommended: One pint of scalded milk, one-half pint of meal stirred into the milk until it begins to thicken. Take off fire and stir in beaten yolks of four eggs; thoroughly mix, add teaspoon (level) of salt, then the beaten whites. Bake twenty-five minutes in rather quick oven. It must be baked carefully, or it will fall.

CRANBERRY MARMALADE

2 qts. cranberries, 4 lbs. sugar, water, 1½ lbs. seedless raisins, juice and the pulp of 3 oranges. Wash the berries, cover with water and cook until soft. Force through a sieve and add the remaining ingredients. Cook until thick. Put in glass jars. This makes three quarts.

BOILED RICE AND RAISINS

Steam one-half cup rice in one pint milk with one teaspoon salt until tender. Add one cup raisins, one teaspoon grated orange or lemon rind and three tablespoons syrup. Serve cold with or without cream.

If the master is neglectful the servant will not be diligent.

Most men figure that the lightning will strike somebody else.

MARKETS.

MONTREAL

COUNTRY PRODUCE

Eggs Fairly Active and Firm—Potatoes Steadier

Montreal, Oct. 19.—A very firm feeling prevails in the local market and prices show no important change. The demond continues good from grocers and other dealers for supplies for immediate consumption, and a good business is passing in a wholesale jobbing way daily. The receipts today were 2,568 cases, as against 959 for the same day last week, and 2,309 for the corresponding date a year ago.

We quote wholesale jobbing prices as follows:

Strictly new laid eggs.....58c to 60c
Fresh selected stock.....00c to 54c
Storage selected stock.....00c to 53c
Storage No. 1 stock.....00c to 49c

A good steady trade continues to be done in honey, and the undertone to the market is firm. Supplies coming forward are not large at present, but they are ample to meet all immediate requirements. The demand is principally for white extracted in 60-lb. tins, at 27c per lb., and buckwheat at 24c to 25c.

We quote wholesale jobbing prices as follows:

White clover comb, per section.....00c to 30c
White extracted, 5 to 10 lb. tins.....00c to 28c
White extracted, 30 lb. tins 00c to 27½c
White extracted, 60 lb. tins 00c to 27c

There has been no important change in the condition of the market for potatoes of late, except that supplies on spot haev been reduced to some extent and a better feeling prevails in the market. The demand is steady and a fair trade was done in a wholesale jobbing way in Green Mountains at $2.15, and Quebec white at $1.90 per bag of 90 lbs., ex-store while car lots of the former were quoted at $1.85, and the latter at $1.65 per bag of 90 lbs., ex-track.

New York, Oct. 18.—Eggs, firm. Receipts, 9,852 cases. Fresh gathered, extras, 57c to 58c; fresh gathered regular packed, extra firsts, 54c to 56c; do. firsts, 52c to 53c; State, Pennsylvania and nearby western hennery, whites, fine to fancy, 82c to 85c; State, Pennsylvania and nearby hennery, browns, 60c to 63c; do. gathered, browns and mixed colors, 50c to 57c.

Chicago, October 18.—Eggs, lower. Receipts, 6,408 cases. Firsts, 48½c to 49½c; ordinary firsts, 46c to 47c; at mark, cases includes, 48c to 49c.

DAIRY PRODUCE TRADE

Trade in Butter Rather Quiet But Prices Firm

Montreal, Oct. 19.—The receipts of butter today were 3,442 packages, as against 1,439 fo rthe same day last week, and 723 for the corresponding date a year ago. The trade in a wholesale way was rather quiet to-day, which would indicate that buyers in most cases have ample supplies on hand for the time being, but there is a steady business passing in a wholesale jobbing way, and the undertone to the market remains firm.

We quote wholesale prices as follows:

Finest creamery.....49c to 50c
Fine creamery.....48c to 48½c
Finest dairy.....41c to 43c
Fine dairy.....39c to 40c

The following prices are being paid by the Commission for butter:

No. 1 creamery, per lb.....46½c
No. 2 creamery, per lb.....46c
No. 3 creamery, per lb.....45c

The receipts of cheese today were 7,447 boxes, as compared with 8,901 for the same day last week, and 5,882 for the corresponding date a year ago. The market was without any new feature to no.et The movement for export account continues liberal and, in consequence, there is little accumulation of stock on spot.

The following prices are being paid by the Commission:

No. 1 cheese.....25c
No. 2 cheese.....24½c
No. 3 cheese.....24c

New York, October 19.—Butter, firm. Receipts, 8,769 tubs. Creamery, higher than extras, 60½c to 61c; extras, 92 score, 60c; firsts, 57½c to 59½c; packing stock, current make, No. 2, 39½c. Cheese, firm. Receipts, 4,493 boxes. tSate, whole milk, flats, fresh, specials, 33c to 33½c; do. average run, 32c to 32½c.

THE CATTLE MARKET

Shipments of Lambs and Calves to the States and Cattle to Toronto Large

Montreal, Oct. 19.—At the Canadian Pacific Live Stock Market the offerings to-day were 200 cattle, 150 sheep and lambs, 450 hogs, and 100 calves. There has been a good demand from American buyers at this market for lambs and calves so far this week, and shipments of 13 carloads were made to New York, and one car of cattle to Philadelphia. A feature of the trade has been the demand from Canadian buyers for small bulls, of which 20 carloads have gone forward to Toronto. This has tended to relieve the market of the surplus stock coming forward, and it has also created a somewhat better feeling. The trade in cattle to-day was rather quiet owing to the small offerings and there were no further changes in prices to note. The demand was ample to absorb what stock was on the market, and sales of odd choice butchers steers were made at $12.25 to $12.50 and the lower grades at from $8 to $11 per 100 lbs. Canning bulls sold at $6 to $7, and cows at $4 to $5 per 100 lbs.

The market for small meats was also quiet on account of the somewhat limited supplies available and prices ruled steady. The demand from local buyers for small lots was fair and sales of lambs were made at $12.50 to $15, and sheep at $10 to $11.50 per 100 lbs. The tone of the market for calves remains firm with a good demand and all offerings of good to choice milk-fed stock sold at $12 to $15, and grass-fed at from $6 to $10 per 100 lbs. In sympathy with the lower prices ruling at other Canadian centres for live hogs the tone of this market continues easy and sales of selected lots were made at $18.50 to $18.75 per 100 lbs. weighed off cars.

The Baled Hay Market

Montreal, Oct. 19—The market for baled hay was without any new feature to note, prices being firmly maintained owing to the very limited supplies coming forward from the interior on account of the very bad condition of the country roads. The demand from all sources for supplies continues good, and all offerings meet with a ready sale, but the volume of business is not large. Sales of car lots of No. 1 timothy were made at $25 to $26, No. 1 light clover mixed hay at $25 to $26, No. 2 timothy at $24 to $25, No. 2 clover mixed hay at $23 to $24, and No. 3 timothy at $22 to $23 per ton, ex-track.

Millfeed and Rolled Oats

Montreal, Oct. 19.—A good steady trade continues to be done in all lines o fmillfeed, and the market is active, with a firm undertone. Sales of car lots of bran were made at $37.25, and shorts at $42.25 per ton, including bags, ex-track, and bran at $39.25 and shorts at $44.25 per ton, ex-warehouse, including cartage, less 25c per ton for

FERTILIZERS FOR 1919

We Supply Fertilizers for Every Crop and for Every Soil

Making two blades grow where only one grew before. By using Shur-Gain Fertilizers, you can increase your yields without additional land, labor, or seed.

For information and prices

Gunns LIMITED

ST. JOHN, N.B.

We would suggest the importance of an early order—it will give you the benefit of present prices and insure delivery.

Potato growers have denomstrated that commercial fertilizers scientifically used will yield a splendid profit.

We have just the grade that you require for your soil and can give you much valuable information.

We specialize on potato fertilizers and can fill your wants at prices that are worth investigating.

GUNNS LIMITED, 676 Main St., St. John, N. B.

spot cash. Pure grain moullie is selling at $68 to $70, feed cornmeal at $66, barley feed at $62 to $63, and mixed moullie at $55 per ton, including bags, delivered to the trade. There was no change in rolled oats, for which the demand was fair, and sales of broken lots of standard grades were made at $5.20 to $5.30 per bag of 90 lbs., and Golden cornmeal at $5.50 to $5.75 per bag, delivered to the trade.

PREPARING THE FLOCK FOR WINTER

The success to be obtained from the farm flock will depend very largely on the way it has been handled during the autumn months. The plan at the Experimental Farm, Nappan, N. S. is, before the breeding season opens in the fall go through the flock, pick out all the non-producers, poor milkers, or any that may have bad mouths or spoiled udders; also any that may be too old for breeding profitably, and discard them. In selecting out the breeding flock looks alone is not the only guide, as many times a ewe may be a profitable breeder yet be very thin, due to the fact that she has been brought down by a heavy milk flow. Good ewes should be retained in the flock as long as they will breed and feed their lambs properly.

All lambs not intended for breeding purposes are sold. If the market happens to be flooded it is found to be more profitable to feed them well until January or February, by putting them on good aftermath until barning time, then finish on roots and meal.

Ram lambs intended for breeding are placed in a separate field with light grain mixture of ½ pound oats; good clover aftermath and given a ¼ pound bran and 1/5 pound oilcake meal. The ewe lambs are also placed in a field by themselves, but not given much grain unless the afterfeed is poor. All breeding ewes are flushed durnig the latter part of October or the first of November. This consists in putting them in a good field of clover and giving them a light grain ration of oats, bran and a little oilcake meal. Hence the ewes made a rapid gain in flesh. There are several advantages from this practice. 1st. The ewes which are bred in a thrifty condition are more apt to throw vigorous lambs; 2nd. They are more reliable breeders; 3rd, more likely to drop twins; 4th, the flock will all breed more evenly together, which makes it much better at lambing time in that the lambs are all dropped within a short period of each other, thus making less work for the shepherd.

In selecting the flock ram it is the endeavour to choose the very best, typical of the breed and vigorous. Then he is fed well in order to keep him virile, but not too fat. He never gets grain until about a month before breeding season. He is never allowed to run with the ewes continuously, but put in with them two or three hours each day.

In dividing the pen for winter, all mature ewes are put together; shearlings in another pen and ewe lambs by themselves. The latter are not bred until one year old. Should there be any weak ones, they too are given a separate pen; otherwise they would not get a fair show at the trough with the more vigorous ones. The above method of preparing sheep for winter has been found to be most satisfactory.

OCTOBER RETROSPECT

Threshing throughout Canada is in full swing and the final estimates of the crop will soon be available. The yield per acre will vary greatly in the different provinces according as the weather conditions have been favourable or otherwise. In contrast if the returns from a series of farms in any locality were compared, the yields per acre of these farms would be found to vary much more than the average yield per acre of the various provinces. The reason for this wider diversity is not weather conditions so much as the methods employed in growing the crop and the difference in varieties and seed.

It is absolutely essential if one is desirous of improving their crop yields that they know the exact yield in bushels per acre that their fields return. Guessing will not do. There has been too much guessing about this important question and many have fooled themselves to their own detriment. Many estimate their grain on the basis of the bushels sown. This method is without practical value. For instance, oats sown at the rate of two and a half bushels will give just as large or a larger yield than oats sown at the rate of three or three and a half bushels per acre.

If a field has yielded only fifteen bushels of wheat or twenty bushels of oats, now is the time that the reason for such a low yield should be ascertained. The past season's work should be reviewed while it is still fresh in the mind. The factors that enter into the successful growing of a crop are many and varied and each should receive attention such as, the previous crop, the tillage operations, the treatment of the seed for disease, the rainfall, the variety sown, the quality of the seed, the date of seeding, etc.

Each of these should be considered until you establish in your mind just what factors are responsible for the low yield. This cannot be done intelligently unless one knows exactly what his land has returned in bushels per acre. Just as each man is able to place his finger on the weak spot in his methods during the last season so will his fields respond in bushels of grain the next. Critical retrospect is invaluable in planning the next year's operations.

WHY SOIL BECOMES SOUR

How can this sour-soil condition be avoided? It arises from several causes: The alkalinity may have been reduced by cropping the land without liming; the decaying process of the green roughage, manure and other organic matter turned in, and the excretions of the plant roots, may all have helped to set up the acid condition.

The acid condition has sometimes been charged to the continued use of chemical fertilizers, but the scientific men have exploded this theory. Doctor Wheeler, formerly director of the Rhode Island Experiment Station, says:

"It is well established that if a soil to which superphosphate has been added remains quite moist for a considerable length of time, the sulphate of lime which is associated with the superphosphate may be partly changed to carbonate of lime within the soil by processes of reduction. When this occurs, the carbonate of lime which is formed will naturally tend to lessen the acidity of the soil.

"Recently Prof. S. D. Conner and his fellow workers at the Indiana Agricultural Experiment Station, have shown that acid soils and silicates, after receiving acid phosphate, were less acid than when they were untreated. They believe this is due principally to the reaction of the phosphoric acid upon acid salts of aluminum.

"Director Brooks, of the Massachusetts Agricultural Experiment Station, has conducted field experiments with super phosphate, covering a period of many yeaes. He states that 'No injurious secondary rffects are known to eb associated with any reasonable use of dissolved phosphates.'

"This question has been studied likewise by Prof. B. H. Hite, of West Virginia University. He has tested hunderds of sample of soil from various parts of West Virginia, and reports that three-fourths of the sour soils and practically all of sourest isols in that State have never had fertilizer.

The Maritime Farmer
SUSSEX, N. B.

"It appears, therefore, that fertilizers, which some people have been condemning because they were supposed to increase soil acidity, really lessen it and thereby actually improve their chemical reaction."

LIMIT TO USE OF CAUSTIC LIME

The danger of burning humus in the soil by using caustic lime is only when the lime is depended upon to nourish the crop in the place of fertilizer. Caustic lime will help to decompose the vegetable matter in the soil and make the plant food available for the crops' use, and if more vegetable matter is not supplied it will soon fail to give results. The burned unslacked lime is worth about double the ground limestone as a sweetener of the soil, and where the haul is long it certainly is more economical to use than ground lime. If an occasional legume crop is turned under there is little danger of exhausting the humus supply.

Wood ashes have the same tendency to burn out the humus in the soil, but who would refuse to put wood ashes on the soil for fear of burning out the humus. We have a farmer in this county who has made his farm very fertile by using wood ashes which he gets from a lumber plant near his farm. By burning or decomposing the humus in the soil, heavier crops are grown that supply more humus-making material so the humus is still kept up and the farm is getting richer all the time. A. J. LEGG.

GUESS WORK IN DAIRY A FAILURE

No breeding farm is complete without an office, or at least, a room, where the owner has a desk and conveniences for keeping records of his herd and breeding operations. No man, no matter how good his memory or how careful he tries to be in the little details of looking after his stock, can give outsiders a favorable impression of his farm and cattle unless he has accurate records to back up his claims. There has been altogether too much guesswork in breeding registered dairy cattle and keeping records of pedigrees and performances of the individuals. A small office or room where one can conduct the farm business, hold conferences with visitors or hired help, and conduct his bookkeeping and correspondence will prove of great value on the farm where registered dairy cattle are bred.

Such a room should be equipped with a good desk, a safe wheer valuable records may be kept, and different account books necessary to keep the farm and herd records. A filing system of outgoing and incoming letters will save a lot of valuable time in looking up old correspondence, and oftentimes be the means of avoiding errors and disputes over the sale or purchase of breeding animals. It is also well to have a good working library and enough current literature regarding the dairy and breeding business to keep abreast of the times and interest men who visit the farm to inspect the stock or buy breeding animals. No breeder can conduct his business intelligently unless he knows what successful breeders are doing and how they find a profitable outlet for their surplus stock. Breeding dairy cattle is no mysterious hocus pocus business, and there are no secrets that are being used to produce better stock on some farms than others. By reading what other breeders are doing a man can approximate their results on his own farm, providing he exercises equal skill in mating his animals and feeding them for development and production. W. M. K.

RUST DOES MORE HARM TO MACHINES THAN CONSTANT USE

Bill Nye was a humorist writer but said many things which were laden with considerable wisdom. One of his sayings was: "We have enough theory to save four worlds like this. What we need is a little more practice." This saying can be applied to taking care of machinery.

As all machinery has advanced so rapidly during the last year, farmers should use great vigilance in making their machinery last as long as possible. Every farmer should have a good machine shed for rust will do more damage to machinery than actual use. When I see machinery left in the field where last used or in one corner of the barnyard, I don't need to inquire the kind of a farmer that lives there. You should buy good machinery, then take care of it, so that when used ten or twelve years it will still look like new.

I never did believe that a machine shed should be used for a poultry house. Never allow machinery to stand out during rainy weather as the wooden parts will swell as well as the iron parts will rust and do more damage than weeks of careful use. A certain farmer bought a new wheat drill, and hired it to a neighbor farmer. A rain came up and the farmer unhitched from the drill leaving it in the field. The rainy weather continued for several days. The owner of the drill said to me: "Do you see my new drill standing out in the muddy field?" I said: "Do you know what I would do if that drill were mine? I would go and hitch to it and pull it home and tell him that I could consider it an accommodation if he would not ask for it again."

It does not take any longer to drive to the machine shed in the evening than it does to unhitch in the field. Should it be raining in the morning your machine will be in the dry which will give the careful farmer much satisfaction. Spend a little time in adjusting the machine so it will work right. I have seen farmers plow day after day with their plow out of alignment when a little attention would have made it run easier and do much better work. Frequently look over your machine to see if all bolts are kept tight. The noon hour is a good time to go over the binder to see if everything is properly fitted. Many breaks occur on account of some bolt getting loose and throwing some of the cogs out of alignment.

Use plenty of good oil. How much nicer a machine runs when all bearings are kept oiled. We find it a good plan to keep an oil can on each machine, then use it often. Perhaps the mowing machine is misused more than any other machine because it is the simplest in construction, yet you should carefully examine it for lost motion, for when your sickle jumps in two that will be the cause. Guards should be sharp and knives well ground then your mower will run like new. Never put machinery away broken for when the time arrives to use it again you perhaps will have to spend time to repair when you should be using it and lose many dollars, a little neglect being the cause.

Oil all polished parts to keep from rusting. There isn't much fun in spending a half day in scouring the mouldboard on the plow when just a little attention at the right time would prevent it. A few years we heard a lecture on "What I saw in the scrap heap." The lecturer told of the thousands of dollars that were wasted on account of indifference in caring for farm machinery. E. T. H.

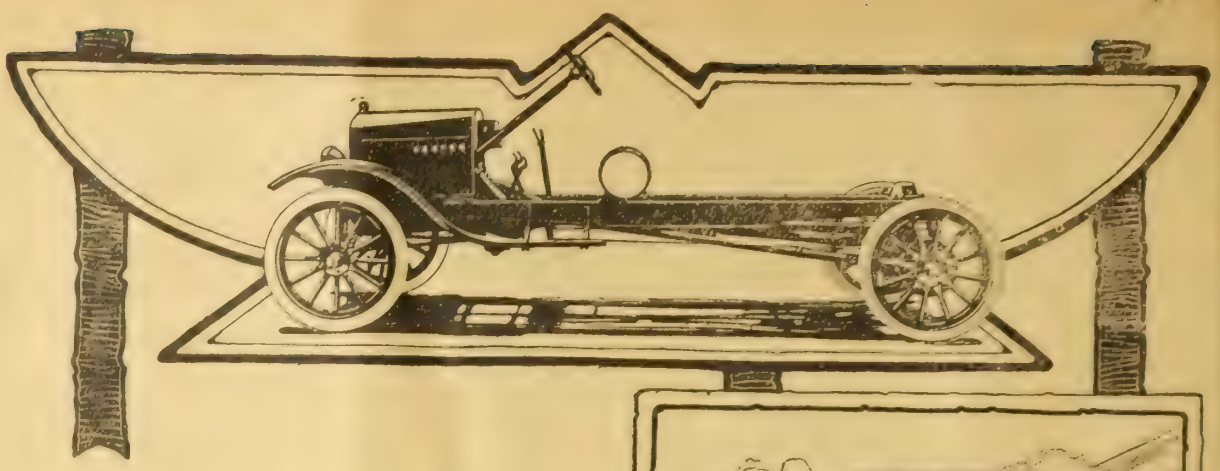
A WHITEWASH SUBSTITUTE FOR FARM PAINTING

A few years ago I spent several weeks in a village where a variety of whitewash was used as a substitute for paint, for both inside and outside work.

Many experiments had been tried to get the best results, and I learned that the formula that gave the best satisfaction was as follows: 30 lbs. lime, 10 lbs. salt, 3 lbs. rice flour, 1 lb. glue, 1 lb. whiting, together with various coloring materials, if desired, to give the required shade. These ingredients were mixed with five gallons of boiling water and stirred till cool, and stirred frequently while using in order to prevent the heavier proportions from settling to the bottom. The ingredients in this paint are the same as in that about which the inquirer asks, though the proportions vary somewhat. They make a paint costing approximately about 25 cents a gallon, at prices that then prevailed. Since it can be applied with a wide whitewash brush, the cost of application is only about one-fourth that of oil paint, and this is still further reduced by the fact that less skilled labor is required in order to do satisfactory work. The quality required, I was told, is a little more than is required of oil paint.

For outside work it gives a neat, clean appearance, and is indistinguishable, from a distance, from oil paint; but, on a closer inspection, it seems a little too glossy and it has a hard, stony appearance, instead of the softer shade which characterizes lead and oil. If applied during cool or cloudy weather it will last for about five years without showing signs of wear, but goes rapidly when once it begins to go, and, in another year, it becomes unpresentable. If applied during hot, sunny weather, it will crack and peel off in large flakes during the following season. Two coatings are necessary, and, in the former instance, if a fresh coating is given as soon as the first coatings begin to wear, the buildings may be kept in good condition, perhaps, indefinitely. But, in the second instance, the surface must be scraped before applying a fresh coating, or the peeling off will continue.

For inside work it is much superior to lime whitewash, though not as good as alabastine or muresco, when applied to plaster. But it is much better than either when applied to wood, though



Saves Money
For The Farmer

PRICES of farm products have reached a high level. The farmer can take *full* advantage of this situation only by adding to his equipment of time and labor-saving machinery. Time and labor are money. When time and labor are saved, money is saved.

Time and labor-saving devices for working the land do not produce complete results in themselves. The farmer must have rapid and dependable means of placing his products on the market.

The Ford One-Ton Truck will make trips to town so much more quickly than the horse that you will have many extra hours of time to devote to productive work. A large number of farmers have proven the Ford One-Ton Truck to be a time and money-saver—have you?

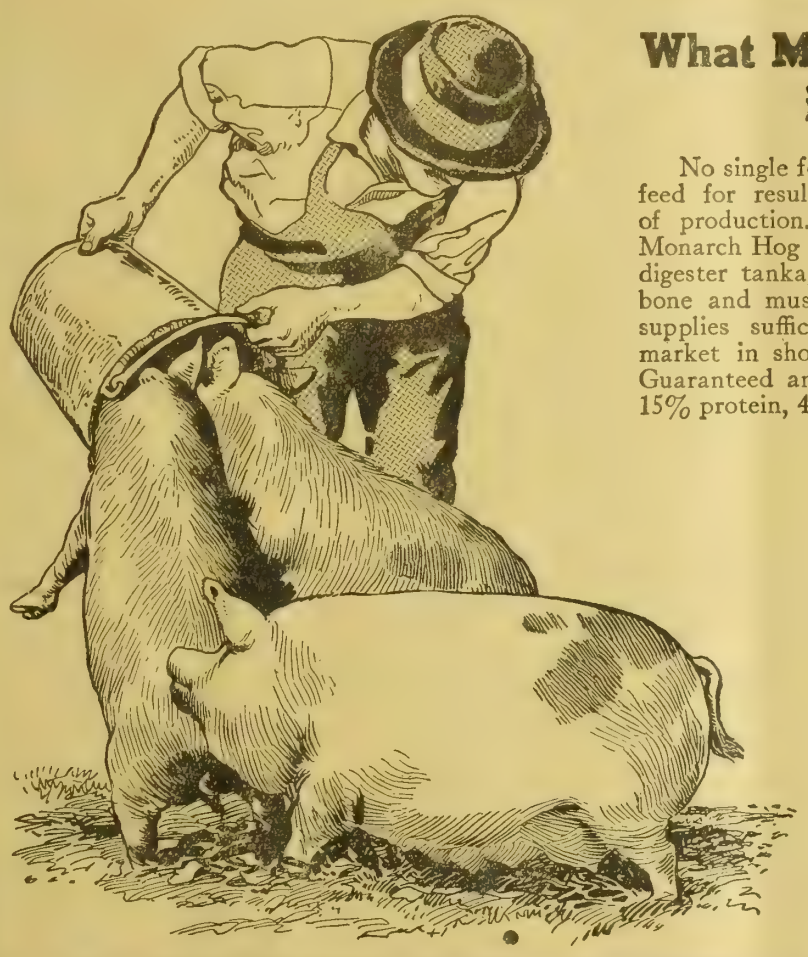
More Pork and More Profit

Heavier, Cheaper Hogs in Less Time

HOW to round your hogs into tip-top shape for an eager market at lowest cost—that is the problem Monarch Hog Feed is solving for farmers every day. Monarch Hog Feed is a properly balanced feed, supplying every requirement for sturdy hogs with stamina, energy, vigor and size; it has exactly the right proportion of protein and fat to finish your hogs in the shortest time.

Monarch Hog Feed

makes more pork and better pork; it shortens the hogs' stay on the farm and reduces cost of production; it gets hogs to market in best condition; in fact it solves the problem of economical feeding in these strenuous times of high-priced feeds—and there's money in good hogs nowadays. Improper feeding is one of the causes of soft bacon, declares Prof. G. E. Day in Ontario Agricultural College Bulletin No. 225. Monarch Hog Feed used along with the proper amount of roughage means good hard bacon that gets the best prices.



What Monarch Hog Feed is made of

No single feed can equal the properly mixed feed for results as to gain per day and cost of production. The principal ingredients of Monarch Hog Feed are shorts, corn products and digester tankage. This combination is rich in bone and muscle forming ingredients, and also supplies sufficient fat to bring your hogs to market in shortest time and in best condition. Guaranteed analysis of Monarch Hog Feed is 15% protein, 4% fat.

Monarch Dairy Feed

has guaranteed analysis of 20% protein and 4% fat. It is a properly mixed combination of Oil Cake Meal and Cotton-seed Meal with the bulky feeds, bran and corn meal. Though very rich, ensuring splendid results, it can be fed alone.

Sampson Feed

This general purposes feed is somewhat similar to Monarch Hog Feed, except that oil cake meal is used instead of digester tankage: it gives results for both cattle and hogs. Guaranteed analysis 10% protein and 4% fat.

Pigs "go for" Monarch just as they are doing in the picture. It is a palatable, easily digested feed. For profitable results it is the most dependable feed—and, remember, you can depend upon getting it, while mill feeds are often unobtainable.

Give it a trial. Order a ton from your dealer and note results. If your dealer does not handle Monarch feeds, send us his name and we will see that you are supplied.

The Campbell Flour Mills Company, Limited

West Toronto · Ontario

10

it shows scratches and bruises much more than oil paint. If not subjected to abrasions, it will last indefinitely, though it becomes unpresentable by reason of dirt fully as quickly as whitewash. The greatest difficulty in connection with its use is the fact that stock of any kind will lick the boards clean, wherever it is applied. Presumably this is on account of the flavor that the salt imparts. C. O. O.

A GOOD MOTHER

The credit marks for brood stock that suckles heavily should be always given. Where the number of ewes or sows is greater than can easily be carried under the hat as to their merits, they should be marked in order of merit, or at least as good or bad mothers. Perhaps nothing will ruin a herd or flock more quickly than cutting out all the thin mothers in the fall. Killing the goose that laid the golden egg was only one notch worse. The fat and saucy mothers that look so well in the fall are those slackers that have shirked the duty of giving milk. Their extra weight is offset by the light weight o ftheir offspring. The best way is to put a little more fat on them and let the butcher have them.

Two Cents a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word, each insertion. Record of Performance Ayrshires

Two bulls fit for service. Ask about them. Young cows. Do you want any ? A pair of yearling heifers. A chance for someone to start easy. Write if you are interested,

THOMAS J. HAWKINS
"Lone Pine Farm" - - Stewiacke, Col. Co., N. S.

FOR SALE !

In Shorthorns we have to offer a number of roans, reds and whites in both males and females, from young calves up. It would pay those wishing to purchase to come and see our stock before doing otherwise.

Our spring litters of Berkshires are all sold. Are expecting several summer and fall litters. Parties wishing to purchase please get in touch with us.

L. M. ANDERSON, Sackville, N. B.

$1,975 FOR A BLACKFACED RAM

Brisk and animated trade prevails in the sheep circles in Scotland. The sheep week, as it is termed, has just passed, and it shows the world wide demands for this class of stock. Farmers who have been breeding the best class of sheep are now finding themselves "in clover." Not only do they carefully grade their flocks, but they organize a sale week for ram yearlings and lambs that gathers men from all parts of the world, to reap a fruitful harvest of high prices.

At Lanark on Wednesday last 1124 Blackfaced Rams were on offer and a new record was made for the breed. Mr. Cazdow, Borland, sold a ram at $1,975 and got an average of $400 for 13 animals. Mr. Mitchell, Hazelside, had an average of $300 and his top price was $1,500.

There was brisk trade at the animal sale of rams at Kelso on Friday held under teh auspices of the Border Union Agricultural Society. Border Leicesters alone numbered 813 and Oxford Downs 1,041 rams. Border Leicesters brought high prices, one buyer paying $1,250 for a ram from Newmiln of Craigessie, whose lot of 10 brought an average of $325. Other individual prices got by consigners ranged from $1,100 to $1,200 and their average prices were high.

Oxford Downs also commanded high market values, individual prices ranging from $500 to $650 with corresponding high averages.

Sheep breeders of Canada might do well to consider this trade which is the result of not only breeding high quality stock, but also organizing a market for them.

AYRSHIRES BULLS !

fit for service, bred from heavy producing stock.

Common Diseases of Digestive Organs of Horses

J. Hugo Reed, V. S.

It is probable that the owner of live stock who does not attempt to treat any but the more simple cases of disease will have better success than if he attempts home treatment for all, regardless of their nature. While each disease, to a certain extent, presents typical symptoms, yet in the early stages of the disease, in many cases, they stimulate each other to such an extent that it is not possible for the amateur, and often very diffificult for the veterinarian, to decide the exact nature of the trouble. Hence, there is great danger of a mistake being made, wrong treatment given, and this continued until the disease has reached that stage in which the most skillful treatment would be ineffective. It does not pay fir the farmer to attempt to treat dangerous or complicated cases.

In advising treatment for the difficult ailments ti be discussed, we shall recimmend only such treatment as can be given by the amateur. We shill assume that those who decide to treat their own stock know how to administer medicines in the usual manners.

In a large percentage of cases diseases of the digestive organs are the result of errors in feeding.

The intestines of the horse are more subject to disease than the stomach, while the reverse is the case with the ix. The reason for this is that the stomach of the horse is a comparatively small and simple organ when compared to the volume and length of the intestines. The food is arrested for only a short time in it, soon passing on to the intestines, where the chief part of the process of digestion takes place. In the ox the large and complicated stomach not only digests, but prepares the food for digestion, while the intestines have a much smaller capacity than those of the horse.

Danger ih Sudden Changes of Feed

In feeding horses we shall assume that the food given is of good quality. Musty or partially decayed food of any kind should, under no circumstances, be given to a horse. Such food may, to a limited degree, be fed with reasonable impunity to cattle, but it is very dangerous to feed even small quantities to the horse.

In feeding horses, all changes in the kind or nature of the food should be made gradually. For instance, a sudden change from hay to straw, or from straw to hay, from oats to other kinds of grain, or even from whole oats to rolled oats or vice versa, from green food to dry food, or more especially from dry to green food, tends to excite digestive trouble. In fact, any change in the kinds, quality or quantty of food should be gradual.

Acute digestive troubles seldom, if ever, occur from underfeeding, but very frequently from overfeeding.

A very large percentage of horses, especially in country districts, are fed too much bulky food.. The average horse will eat too much hay if allowed access to it. In discussing the proper manner of feeding horses we shall consider hay as roughage and oats as the grain ration. Where substitutes for either are used, the feeder should exercise reasonable consideration as to its nature.

It is not possible to lay down hard and fast rules as to the exact amount in weight or bulk of either hay or grain that a horse of a certain weight should be given. As all feeders have observed, horses have their individualities. Hence some require a little more feed than others of apparently the same character and general size.

One pound of hay for every 100 pounds of the animal's weight is supposed to form the proper ration for twenty-four hours. Some horses require a little more, but the excess should, in all cases, be slight. Of this the animal should be given about one-quarter in the morning, one-quarter at noon, and the remaining half in the evening. The smaller meals are given in the morning and at noon, as the horse will be taken out to work soon after eating, and if his stomach is overloaded, it tends to cause digestive trouble. At any rate, if over fed, he does not perform his labor with that comfort to himseif and satisiactfon to his d river that is desirable, until he has been at work for an hour or two. The large meal is given in the evening, as he will have several hours of idleness in which to digest it.

To Much Hay Injures Horse

In no case should he be given more food, including both hay and grain, than he will consume in about one and one-half or at most two hours. The too common practice of keeping hay before horses at all times when they are standing in the tsable is as harmful as it is wasteful. Whether a horse be performing hard work or light work, or standing idle, the amount of roughage should be about the same. He should have sufficient to satisfy his hunger, but not sufficient to cause engorgement. Most horses are gluttons, and should be treated as such.

As regards feeding grain, the amount given should depend largely upon the nature of the work he is expected to do. Even an idle horse should be given a little grain. As with hay, we may say that under ordinary conditions one pound of oats to every 100 pounds of the animal's weight makes a reasonable ration for a day—we assume that the grain is of standard quality, viz., 34 pounds to the bushel. The grain should be given in equal quantities at each meal If by reason of the horses having to perform more than ordinary labor we wish to feed more grain, the best results will be obtained by feeding a fourth meal late in the evening. When this is not expedient the extra amount may be divided among the three meals, giving one-quarter of the total quantity in the morning and at noon and the remaining half at night.

Opinions differ greatly as to the better form in which to feed oats. The writer's experience, both in feeding his own horses and in giving professional attention to others, is, that under any conditions rolled or crushed oats give the best results. We have noticed this in our own stable, and noted that in stables of horses used either for light and fast work or for heavy and slow work, the stable that feeds rolled oats has need of the veterinarian much less often than the one in which whole oats are fed.

In addition to hay and oats a horse should be given a feed of bran at least once or twice weekly. Many feeders, especially where whole oats are feed, add to each feed of oats a quantity of bran. This practice gives good results, but we have always favored feeding bran by itself, either as an extra or as a substitute for oats, according to conditions. During the months when no pasture is available, it is good practice to give a horse a couple of carrots or a small mangel or turnip once daily.

Watering Horses

Opinions differ greatly as to the proper method of watering horses. Some claim that horses should be watered only before meals, and never when they are perspiring. The prevalent idea that if a horse be watered after a meal the water will force the food out of the stomach before it has been properly acted upon by the juices of the stomach, has practically no force.

As before stated, the stomach is comparatively small; hence after a meal it is, or should be, practically full. The opening of the gullet into the upper portion of the stomach is somewhat constricted, and the opening at the lower part (called the pylorus) into the small intestine, is quite constricted. The contents of the stomach after a meal consist in small particles of solid matter mixed with the juices of the organ. It is a mechanical fact that fluids introduced into a receptacle containing particles of solid matter will not force the solids out of a small opening, but will percolate through the particles, and when the interstices become full, if the fluid does not escape, no more can enter. Hence, are we not justified in assuming that when a horse with a full stomach drinks water it percolates downwards and fills the intestines, then reaching the pylorus passes through it into the small intestine, and passing through that reaches the first division of the large intestine called the caecum, a sack-like organ of considerable capacity, where it is stored and taken up by absorption as required? If this theory be correct, it can readily be seen that a horse may be allowed to satisfy his thirst any time without forcing unprepared injecta out of the stomach.

Again, the idea that it is dangerous to allow a horse that is perspiring to drink cold water is too firmly impressed upon the mind of the ordinary teamster. Of course, there are cases in which it would be dangerous to allow a horse free access to cold water, such as a case where the animal had been subjected to long continued and very strenuous labor, either fast or slow, and had become excessively warm. The introduction into the system of large quantities of cold water might develop such severe reactions as to cause serious trouble. In such cases a few mouthfuls should be allowed, the horses well rubbed, and in a few minutes a little more water allowed. After the abnormal heat of the body has subsided he may safely be allowed to quench his thirst. Conditions of this kind seldom occur. The fact that in hot weather a horse doing ordinary work will perspire freely is no reason why he should not be allowed to drink as much water as he wants.

The teamster is justified in supposing that his horse's sensation of thirst is as acute as his own. This is frequently impressed upon his mind by the desire the horse exhibits in his haste to reach water when he is thirsty. When the teamster is thirsty he usually finds means of allaying his sensation. When his horse is thirsty he "wants a drink" and, except under exceptional circumstances his desire should be gratified as soon as possible.

Some horses are particularly predisposed to colic and will suffer if given food or water under certain conditions. Such animals should be treated accordingly.

Medicines Should Be On Hand

The owner or teamster who considers treating cases of illness in his own stock should provide himself with the drugs he is likely to require. These should be kept in as even a temperature as possible, bottles should be kept well corked and plainly labeled, powders and crystals kept carefully wrapped and plainly labeled and all kept in some secure place, out of reach of careless people and children.

He should also provide himself with a graduate for measuring liquids and scales for weighing solids. Where a graduate or other correct means of measuring liquids is not kept some of the ordinary domestic utensils may be used with reasonable accuracy. Common tumblers contain eight to ten fluid ounces; wine glasses about two fluid ounces; table spoons half a fluid ounce; dessert spoons two fluid drams.

Well-Kept Farms in Westmorland County

Editor Maritime Farmers, Sussex.

A competition for the silver cup donated by A. E. Copp, M.P., for the best-kept farm in the parishes of Botsford and Westmorland has aroused some interest and pride among the farmers of Botsford parish in the achievement of securing the trophy. The cup must be won three times, not necessarily consecutively, before becoming the property of the contestant. It has been awarded this year to Mr. Arthur Oulton, Little Shemogue.

The basis of criticism and the scale of credits used in making the judge's decision are contained in the pollowing paragraphs:

Scale of Credits used for comparing farms.

(a)	Lay-out.....15	credits
(b)	Freedom from Weeds..10	"
(c)	Drainage.....15	"
(d)	Maintenance of Fertility 15	"
(e)	Live-stock complement 25	"
(f)	Home comforts and farm equipment.....20	"
	Perfect score.....100	"

(A) The general lay-out or geography, of a farm includes the location of the farm-stead, the utilization of natural or artificial windbreaks or shelters and tsock-watering privileges in barn-yard and field; the size of the fields in relation to the size of the farm their accessibility, general slope and contour, also the stability of the farm fences, the location of gates and the permanency of the farm roads.

Fields should be large, rectangular in shape, free from obstructions such as stone piles or stumps and enclosed with strong fences having conveniently placed wide gates.

The farm lanes should be straight, well drained and graded.

(B) The freedom from weeds of fields used as pastures or hay-meadows for grain and root crops is considered. A weed-free farm indicates a well managed farm, while a weed-infested farm indicates poor farm practice and too frequently a land-poor condition of the owner.

Weeds and wild-grasses lessen the value of a field whether it be included in the regular rotation system or used only as pasture because the quality of the hay and grain crops is inferior and its stock-carrying capacity is decreased.

(C) Drainage. Good drainage of the farmestead and fields is essential to the health and well-being of the family and farm livestock as well as for the promotion of farming operations. A well drained soil will, even in dry weather, produce a much better crop than will an undrained soil of the same type, while exclusion from the regular crop rotation during a succession of rainy years may result in these wet areas becoming waste portions of the farm.

The contour of the land and the type of soil and subsoil sometimes result in a condition of natural underdrainage, otherwise artificial farm drainage by means of open ditches or underdrains is necessary.

The need for drainage is indicated when water stands at or near the surface of the soil long enough (a) to interfere with tillage, planting or harvesting operations; (b) to render the soil soggy or compact. These indications obtain on some portion of each farm.

The construction and maintenance of adequate open ditches to regulate the water supply and to serve as efficient outlets would return large dividends in increased croy yields.

(D) Maintenance of fertility. An ideal farm management scheme on a live stock farm would maintain the soil at a profitable state of fertility by a system of crop rotation, (in which clovers are frequently grown) the return of farm manures to the soil, and the addition of phosphates and lime or some source of lime such as mussel mud, and burned oyster shells.

The area of grass crops needed or desired largely governs the size and number of fields and the rotation scheme to adopt. Pasturing tillable land is an expensive method of stock feeding where rough pasturage may be supplemented with green crops and roots. The root area on all farms visited could well be increased and the condition of pasturage and hay meadows would be improved by more frequent renewal and a more liberal use of clover seed.

(E) The Live-stock complement of the farm is its most important adjunct, and every phrase of farm management is bent toward it. Of course some crops need to be grown and sold as cash crops but the larger part is marketed "on four legs" through the medium of live stock. Live stock supplies the motive power of the farm, increases the interest in and attractiveness of farm life, maintains soil fertility, tends to improve the business organizations, reduces the living expenses by the improvement of the diet, and is frequently the principal source of income.

The amount of feed which may be profitably fed is determined by the quality of the farm livestock therefor good feeding, good breeding, care and selection in raising young animals should be the common rule of farms.

(F) Farm Equipment, Home Comforts and Conveniences: A comfortable living made from the land in return for his husbandry is the recompense of the majority of farmers. Equipment fo rthe barn and field to carry on the farm activities efficiently and quickly assists in the attainment of his business success. Household equipment is equally advantageous and necessary to the happiness and contentment of the farm family. A good house-cellar, a well-arranged group of sanitary outbuildings, a good orchard and kitchen garden nearby and modern conveniences in the house, with a convenient and reliable water supply, make farm life attractive.

A farmer's success comes from doing certain things, among which the neatness and general equipment and state of repair of the farmstead contribute largely to his well-being and to his service to the community.

O. C. HICKS,
N. B. Dept. of Agriculture.

LINE BREEDING THAT MADE A $106,000 CALF

The sale of $106,000 Holstein bull calf by A. C. Hardy, of Brockville, was the dairy sensation of the year. Kimball's Dairyman, in a recent issue, goes into the breeding of the anaimal with considerable detail, pointing out the various phases that entered into it, in a combination of "the elements of chance, good fortune and foresight."

A study of the pedigree of this famous bull, however, indicates that the element of foresight was the principal one, says H. G. Van Pelt. When good fortune follows a man's good judgment and enables him to develop and perpetuate his ideals, then the element of chance is not entitled to much credit, except as it serves one's modesty.

Champion Sylvia Johanna is a remarkably well bred bull. The principle of scientific line-breeding adopted by Mr. Hardy, contrary to the advice of his friends and other breeders of Holstein cattle, has given to the Holstein breed an animal whose influence on his offspring, used intelligently, will be seen for generation to come.

Disturbed at Price

Mr. Hardy secured the first blood lines of this bull in 1910 when he purchased the grandson. Bell Moded Johanna, at the Syracuse sale. In 1911 he became interested in another line of breeding, but his inexperience caused him to be extremely cautious. He wanted to purchase the then famous cow, May Echo, but $1,500 seemed to him a big price to pay for a cow.

His infatuation, however, for the cow and for her daughter May Echo Verbelle, influenced him to send his herdsman, Mr. Logan, to see a daughter of the last named cow with instructions to buy her if she could be secured for $500. He was very much "disturbed" when Mr. Logan returned with May Echo Sylvia, having paid $1,000 for her. This was probably double the price that had ever been paid for an unkown Holstein heifer in Canada up to that time.

This purchase is what Mr. Hardy calls chance, but breeders of cattle will recognize the display of excellent judgment on the part of Mr. Logan; and Mr. Hardy says of him: "He is considered one of the best Holstein judges in Canada."

With the purchase of May Echo Sylvia began a system of breeding that shows the excellent judgment in vogue on the Avondale farm.

The records of the granddam and the dam are interesting. May Echo was owned by the Allison Farm when she completed a record of 25.08 pounds of butterfat. Her yearly record of 24,000 pounds of milk and 833 pounds of butterfat puts her above any other Canadian producer.

May Echo Verbelle was considered a better cow than her dam. She was a persistent milker, it being practically impossible to get her dry. Notwithstanding this handicap, she produced more than 700 pounds of milk in a week. She also made a record of 23.91 pounds of fat without being dry. Her daughters and granddaughters were all record making cows, proving the wonderful producing qualities of the family.

May Echo Sylvia proved her ability when, as a four-year-old, she made 27.15 pounds butterfat, 759 pounds milk with 112.96 pounds butterfat in 30 days. Her later records give better evidence of her producing ability. She produced 152.1 pounds milk in one day and more than 1,000 pounds in seven days, 4,196 pounds in 30 days, and 12,899 pounds in 100 days. Not only has she accomplished this wonderful feat for one year but has made high records for five years.

Her first two calves after coming into the possession of the Avondale Farms were sired by King Pontiac Artis Canada, their herd bull, that is by the great King of Pontiacs, out of Pontiac Artis, a high producing daughter of Hengerveld De Kol. Her second calf throughcalf, Avon Pontiac Echo, a great bull, is the grandsire of the $106,000 calf through his son, King Echo Sylvia Johanna.

Real Good Fortune

Mr. Hardy then decided to secure for the head of the herd a calf from this famous cow. She was sent to be bred to Spring Farm Pontiac Cornucopia, a son of the then highest re-

'Agricola' and the Founding of the First Agricultural Society in Nova Scotia

By "Hal"

In 1818, when the Earl of Dalhousie was governcr of Nova Scotia, a series of letters on agriculture began to appear in the "Acadian Recorder" published at aHlifax, N. S. They were written in the best classical English and treated many different departments in agriculture, beginning with the need of better implements, seed, stock, etc., and going on to tell of the good that agricultural societies could do and of methods of tilling the soil.

These letters were signed "Agricola" and even the editor of the paper did not know who "Agricola" might be, because the letters were forwarded through another man, who acted as a "go-between."

The letters began to arouse the people and they tried all the ways they could think of, to find out who the writer was.

One man thought a certain clergyman was the author. The clergyman had occasion to leave town and the man immediately wrote to "Agricola", thinking that if he did not get an immediate reply it would thus be proven that the clergyman was "Agricola". But "Agricola" immediately replied.

Several months after the letters began to appear in the paper, it was found necessary to form an agricultural society on account of the feelings aroused in the people. The Provincial Agricultural Society was the result. It met at Halifax to nominate it's officers and the Earl of Dalhousie was chosen for president. When the members were asked whom they would choose for a secretary, everybody shouted for "Agricola" but none of them knew who he was.

Now it chanced that "Agricola" was at the meeting and heard all that was said about himself. He left wtihout saying anything, but after thinking it over, he decided that the best way he could help the society was by making himself known, so he told his story to Governor Dalhousie, the president of the society.

He turned out to be a Scotch merchant of Halifax, named John Young.

The following is a short sketch of his life. It may be found in Duncan Campbell's "History of Nova Scotia."

Mr. Young was born at Falkirk, Stirlingshire, Scotland, in September, 1773. He was sent to Glasgow College where he distinguished himself as a classical scholar and as an adept in most of the sciences, especially chemistry.

His parents wanted him to enter the ministry and he wanted to enter the medical profession. He at last turned his attention to mercantile affairs in Glasgow.

At twnty-five he married a daughter of George Rennie, Esq. They had nine children, all born in Scotland. Only the eldest and the youngest lived. They were Sir William, Chief Justice of Nova Scotia and Hon. Charles Young, a judge of Prince Edward Island. Mrs. Young died in Halifax, in 1863, at the age of eighty-four.

In 1814, Mr. Young come to Nova Scotia and carried on a merchant business for four or five years.

In 1818 he wrote his letters for the "Acadian Recorder."

In 1819 he purchased a farm two miles from the centre of Halifax, naming it Willow Park. He lived there until hi sdeath in 1837.

In 1825 he entered the Legislature and made many eloquent speeches.

In private life his manners were most genial, hi sconversational powers remarkable and he was always ready to give useful instruction to his associates.

---

cord cow. This bull was chosen after some months of careful investigation, his grand individuality being the deciding factor, together with that of his dam, plus her records. From this mating was secured Crampion Echo Sylvia Pontiac, the bull now at the head of the herd at Avondale.

Mr. Hardy claims that the element of good fortune came into the famous bull's history when, contrary to the advice of his herdsman, Mr. Logan, he bought a calf, Belle Model Pohanna 2nd,, for $715. This cow made a record of 25.63 pounds of butterfat and also won many honors in the show ring. She produced three heifers in succession, all of which made good records. At a later freshening she produced an almost white bull sired by a son of May Echo Sylvia and King Pontiac Artis Canada. At this freshening she made 29.87 pounds of fat.

The calf was a most promising individual and it was a question for some time whether or not he should be kept as a herd sire, but it was finally decided to consign him to Mr. Moyer's sale at Worcester. In the meantime several efforts were made to purchase him at almost unlimited prices but Mr. Hardy preferred to let the public put a price on him.

One reason for keeping him so long was to enable them to breed him to several of their best animals, one of which they decided in advance would be May Echo Sylvia. This was to be done in order to procure a double cross of her blool in her offspring, and also to bring in that of the King of the Pontiacs. May Echo Sylvia was thus bred to King Echo Sylvio Johanna, her grandson, thereby bringing into her offspring, the now famous $106,000 bull calf, the desired King of the Pontiac's blood—a double cross of her own blood combining it with that of Johanna Rue 3d Lad, through one of the finest cows in the Holstein breed, Belle Model Johanna 2d.

Scientific Line Breedng

Here is an excellent example of scientific line breeding and there should have been no doubt in the mind of anyone, that results would be favorable. The result was most satisfactory at the time, and the calf, Champion Sylvian Johanna, promised to be a grand individual from the first. From the end of the first week of his life he was elected the leading member of the Avondale delegation to Mr. Moyer's 1918 sale.

Mr. Hardy predicts the famous bull's future largely by his brothers and sisters and his own individuality.

He says "If we may judge the future by this calf's brothers and sisters, as well as his own promising individuality, he should grow into a surpassing bull."

There is something more than the quality of the brothers and sisters, and the individuality of the bull, by which he may be judged. It is the intensified blood which was transmitted to him by a double cross of his mother's blood. Added to that is the blood of the famous King of the Ponistics which unite to make him a desirable animal.

Added to this, too, are the phenomenal records of his ancestry on both sides for generations back, so that, in this bull we have the characteristics which unite t omake him a desirable animal.

He has the blood of his immediate anacestry well fixed. He cannot help but transmit the remarkable qualities of the famous cow, May Echo Sylvia. His ancestors on both sides are high producing animals, without a single exception. He has a remarkable individuality—an individuality he coula not otherwise have when we know the plan of scientific line breeding that was used in producing him.

The purchaser of the bull has an opportunity seldom offered to breeders of cattle. Here is a bull whose blood has become intensified. There is not any possible chance for the law of reversion to manifest itself; the element of chance has been removed so far as the prepotency if the bull is concerned. The owner must, however, know the blood lines of the females with which he is mated. It would seem advisable to continue the mating of the family blood lines that have become so well established in this remarkably well bred bull.

It would be nothing short of a calamity to use this bull in a herd in which there is no relation of the hereditary material that is in him. The chief advantage of line-breeding is that the results can be predicted almost with a certainty and when they do appear, and improvement is at hand they are backed up by a most powerful hereditary force, becauase the blood lines in the line bred animals all blend together, and tend toward permanent improvement.

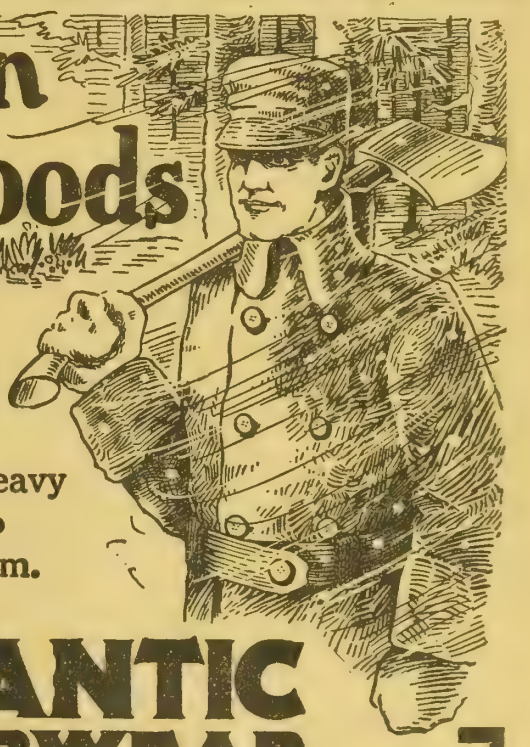
Mr. Hardy has succeeded with the principle of line breeding. He possessed a rare ability to select animals and because of this, coupled with his foresight anad good judgment in mating them, has contributed much to the Holstein breed.

SCALY LEGS

Scaly legs on hens are caused by a minute mite, known as the scaly leg mite. This tiny mite burrows under the skin, where it lives and breeds, forcing the scales of the leg up. When badly affected, the birds stop laying and become lame.

Control.—Soak the feet of the affected bird with soap and water to soften up the scale. After brushing the scale, apply an ointfent to the legs, composed of one part oil of caraway and five parts of white vaseline, or an ointment made of flowers of sulphur, one dram; carbonate of potash, 20 grains; and lard or vaseline, half an ounce.

Some poultrymen have used a mixture of one part of kerosene and two parts of raw linseed oil with speedy effect. The legs of the affected fowls are dipped in this mixture, care being taken that the feathers are not wet.



Out in the Woods

In the biting cold, you must have good, heavy underwear, to keep you warm.

ATLANTIC UNDERWEAR

is made of strong, sturdy, Maritime Wool—without an equal for strength, warmth and wear. The stout weave and good weight keep the body comfortably warm under the worst conditions of climate and weather.

It's the Underwear for all men who work out-doors, so well made too that it allows free play of the muscles.

This Trademark on every garment, guarantees long wear. Look for it.

UNITED FARMERS WIN

The election of a representative to the provincial legislature of Ontario, from the constituency of Manitoulin, resulted in the return of Benjamin Bowman, the candidate of the United Farmers of Ontario, over his opponent, B. H. Turner, the government condidate by a substantial majority. It was the first time the United Farmers of Ontario tested public opinion through the polls. They won and their experience will doubtless lead to other contests with equally encouraging results to them. The farmers of Canada promise to have much more to say in the affairs of this country in the not distant future. Up to the present they have been unrepresented in parliament or legislatures, except in the every-day haphazzard fashion. It is noticed that some of the daily papers, of a violent political stripe, attempt to interpret the outcome of the Manitoulin in an old time political sense. There they mistake the situation. The old political ideals and the old political lines have been buried by the present war so deep, that let us hope nothing but the best of them will ever be disinterred. The Manitoulin contest simply emphazises that the farmers are awakening to their opportunities and that in future they will make a much bigger noise in the political world. And if they are councelled by wisdom, they will do that very thing. On every hand in Canada are arising strong organizations, which seek to impose their views on the majority. If the farmers are satisfied to swallow every other person's views, why they will stand apart. If they want to say their say and receive attention, they will get together. Manitoulin indicates only one thing, that the farmers decided to speak as farmers and they have been heard in every province in Canada.

DO NOT OBSTRUCT ROAD DITCHES

The Department of Public Works for New Brunswick sent the following article for publication in the columns of the Maritime Farmer:

Road Supervisors in very many parts of the Province who have taken great pains to make ditches and otherwise to follow out the drainage instructions for the benefits of the trunk and branch roads are complaining bitterly of the carelessness of very many of the residents in their districts. who evidently think that a road ditch is only made to be obstructed, for instead of building small pole bridges across the ditches so as to get into their fields, they level up the road by throwing a lot of poles or stones or brush into the newly made ditch. The Supervisors say that if they are asked to remove the obstruction, in many cases they either refuse to do so or else say they will attend to it and never get round to it. The result is somewhat discouraging, for the very heavy rains of the past month have caused an unusual flow of water in the road ditches, and wherever this meets with such an obstruction as described above, the water invariably gullies out the new roadway and does, in some cases, hundreds of dollars worth of damage. There is a section of the Highway Act of 1918 which says that no person shall under the penalty not exceeding $20. with costs of prosecution or imprisonment for thirty days—"pile any wood, logs, lumber or stone or refuse within the limits of the right of way of any highway and leave the same within the limits of the said right of way for a longer period than twenty-four hours."

Any person who shall continue any encroachment or obstruction on any highway or ditch after a notice verbally or in writing by the Supervisor requiring him to discontinue or remove the same, shall be deemed to have encroached on or obstructed such highway or ditch within the meaning of this section."

The Highway Act further says that any person who by obstructing a highway, causes injury to the same, shall be liable to repair such injury under the instructions and to the satisfaction of the Supervisor, and in case he does not after being notified by the Supervisor, the same shall make such repairs and may recover the cost thereof together with costs of suit.

The Act therefore is very plain about obstructions in the ditches or roads, but no doubt is not very generally understood to be so by those who disregard the public interests and upkeep of the roads by placing obstructions in the ditches. The Road Engineers and Supervisors all consider it of the utmost importance that particularly during the fall and spring, residents should exercise the very greatest care in keeping the ditches clean and assist to perfect the drainage of the road system without which good roads are impossible.

PRODUCTION MUST INCREASE

The Canada Food Board says:—There has been no call for slackening efforts. The impression seems to prevail that Canada has done well enough in growing grains, and the future is assured, so far as food is assured. Such is not the case, has not been the case, nor will it be for some time to come. The call is for more and yet more production, and the cry for food is still loud in the ears of Canadians.

The hard work and self sacrifice of Canadians has borne fruit. Great Britain cannot be starved. There is enough to provide for the armies and the civilians until the next crop, but no more. There are no food reserves, as there should be.

Indeed, Canada must double its production in 1919. Let that soak in. The continent of America has promised, and must deliver 15,000,000 tons of food stuffs this coming year. In 1917-18, 10,000,000 tons were promised and will be delivered. America must produce 50 per cent more, for the Allies. That's the job before the farmers and citizens of this country. The great crops of grain in the United States in 1918 may not be duplicated next year, and Canada will have to deliver a still greater share.

There are but two ways of securing this total—production and conservation. And the greater of these is PRODUCTION.

The manifest duty of the hour is to prepare the land for the coming of banner crops in 1919.

PLOUGH, PLOUGH, PLOUGH. This should be hammered into the consciousness of Canadians NOW.

PRODUCTIVENESS OF A MAN

When a young man left Toronto. where he was bookkeeper, he went to work as a hired man on some Simcoe county farms. Later he rented a farm, and now he has a comfortable home on the farm thta he bought "on a shoestring," as it were.

Since making the change he has been able to raise a little family under most favorable conditions, where education and physical development go hand in hand, and has been able to enjoy life greatly—as he sees it.

Had he remained in the city he would possibly have been a bookkeeper till the end of his days, and as the years went on he would be gradually declining in productive ability, and ni the end would become a charge on others.

In his life on the farm, he is doing his best to increase the fertility and value of his land, and in this way is increasing his productive ability, so that his value to the state will be manifoldly greater at the expiration of fifteen years than had he remained in the clerical work of the city.

That man is a patriot. And that man is happy, to-day.

BRITAIN MAY FEED HERSELF

Will the United Kingdom produce its own food supply after the war? Sir Charles Fielding, the new Director-General of Food Production, a great-grandson of Henry Fielding, and a practical farmer, who was brought up on his father's farm until he was 17, and later studied farming in California, thinks it may. Sir Charles recently said for many years he had been endeavoring to show that Great Britain could produce the bulk of her heavyweight foods for both man and beast. and he would now endeavor, as far as he could, to prove the theory. This year's harvest, he believes, will be the biggest since 1868, and still greater acreage is to be devoted to production in future.

FINANCING BILL'S FINISH

"War does not admit of holidays," said the great Lincoln. No one knows this better than the men of Canada. For four years we have fought the fight of freedom against terrible odds. We have raised men and money whenever asked. And there has been no holiday, no cessation of anxiety until now when the clouds seem to be breaking. Yet the final drive needs every one's savings in order to help our country finance the end. Only then will we be able to take a holiday, when the dollars of Canadian money have forced the enemy to where he belongs.

No farmer or business man, whose patriotism has made him buy a few Victory Bonds, can fail to appreciate how much he has helped out. The present Victory Loan is another chance to ensure to us a decent holiday from war and autocracy. Be sure you share largely in the next call. You can't help in a better way now.

Not many leaves need to fall to make a heavy loss in a clover crop.

ON PURCHASING FEEDING STUFFS

By Frank T. Shutt, M.A., D.Sc.

The farmer's profit in connection with his live stock depends not merely on getting a good price for his produce—beef, mutton, milk, etc.—but also on buying his feeding stuffs with a careful discrimination as to their relative nutritive qualities. He must not only watch market prices and when necessary obtain quotations, but he must know something of the real feeding values of the several feeds offered. It is with rgard to this latter phase of the question that we propose to give some information; it must necessarily be put briefly.

It stands to reason that as far as may be practicable, home-grown fodders and grains should be produced and used, for in the feeding of them all manufacturers' and salesmen's commissions are saved, and the fertilizing elements they contain may be returned to the land in the resulting manures to increase its fertility. But to supplement these, it is necessary, chiefly to make a well balanced and highly productive ration, to purchase one or more of the various milling or manufacturing by-products upon the market. These, naturally, differ widely in composition and hence in feeding value. They differ also greatly in price, and it is well to bear in mind that the price is seldom any criterion as to feeding value; frequently we find that the cheapest feeds could not be profitably fed were they purchaseable at half their marked price. On the other hand, the most expensive, by reason of their richness in the more important nutrients, may be the most economical to purchase.

The whole subject of the composition of feeding stuffs and the functions of the several nutrients—protein, fat, carbohydrates, etc.—in the animal economy, is well worthy of the careful study of the progressive farmer.

The Composition of Feeding Stuffs.

The value of a feeding stuff depends primarily on its composition. All fodders and feeding stuffs are composed of the same constituents (known as nutrients) and differ among themselves in their value to the animal chiefly from the fact that the proportions of these constituents vary greatly, according to the nature of the feed. These constituents are as follows: moisture, protein, fat, carbohydrates, fibre, ash. We shall not here attempt any complete account of these nutrients, but merely emphasize one or two points in connection therewith which will enable the farmer to purchase his feeds to the best advantage.

Protein.—This constitutes the nitrogenous portion of the feed. Its chief function in the animal is the formation of body tissues and fluids—muscle, blood and milk. Of all the nutrients it is the most important and valuable, for no other can take its place in this essential flesh-forming work. Without it, or if it is in insufficient quantities, the animal cannot thrive, or grow, or produce milk.

Fat or Oil.—Of the non-nitrogenous constituents, fat has the highest nutritive value. It is used in the animal for the production of fat—the fat of the body and of the milk; for the generation of the vital heat, and as a source of energy or power to do work.

Carbohydrates.—These include starch, sugar and allied substances, which as a rule constitute the larger part of the dry matter of a feed. Their function in the animal is to produce heat and energy (for which purpose they are less valuable, weight for weight, than fat), and under certain circumstances they may become a source of body fat.

Fibre.—This is the least valuable of the nutrients. In composition and function it is similar to the carbohydrates, but it is less valuable to the animal by reason of its being less digestible. An excess of fibre, especially if it is of a woody nature, depresses the digestibility of the other nutrients and thus may reduce the value of an otherwise ercellent feeding stuff.

Ash.—This is the mineral matter taken from the soil by the plant in its growth. It is composed chiefly of lime, magnesia, potash and soda combined with phosphoric and other acids. In the animal it assists in the formation of bone (large phosphate of lime) and furnishes that small quantity of mineral matter found in all animal tissues.

Importance of Protein and Fat

The farmer buys feeding stuffs chiefly to enrich his home-grown fodders and grains with protein and fat, and thus make them more effective; in other words, to make a well-balanced ration. The value of these purchased feeds will depend chiefly, therefore, on their percentages of protein and fat, and to some extent on a low fibre-content.

The Commercial Feeding Stuffs Act of Canada requires that the larger number of the milling and manufacturing products sold as feeds (bran, shorts and the meal of whole grains are excepted) bear a tag or brand guaranteeing the minimum percentages of protein and fat and the maximum percentage of fibre in the feed. These guarantees should be looked for and well studied before making a purchase, for it is not always possible from mere inspection to judge of the quality of a feed or to be sure that it is unadulterated.

Lowest-Priced Feed Not Always Cheapest

Let us suppose the farmer is buying cottonseed meal. He has two samples submitted to him, "A" and "B". Except that one is somewhat brighter and yellower than the other, they are much alike. "A" is quoted at $30 per ton; the price of "B" is $35. Are the market prices of these meals in accord with their nutritive values? Or, to put it otherwise, if "B" is worth $35 per ton, what is "A" worth? Their composition is shown in the illustration.

Assuming that the farmer is purchasing, essentially, for the protein and fat these feeds contain, and that these nutrients are approximately equal in value to him, we may proceed as follows:—

A.		B.	
Protein	26.50	Protein	37.62
Fat	5.84	Fat	7.91
	32.34)$30.000(.927		45.53)$35.000(.769
	29 106		31 871
	8940		31290
	6468		27318
	2472		39720

Price per protein-fat unit in "A"..... 93 cents approximately
" " " "B"..... 77 " "

Difference ..... 16 " ".

It is thus apparent from these simple calculations that the price asked is 16 cents higher in "A" than in "B". The relative value per ton of "A" as compared with "B" is, therefore:—

Total protein-fat units in "A"= 32.34, multiplied by the price per protein-fat unit of "B"= .77 cents.

22638
22638

$24.9018

We thus see that with "B" at $35 per ton, "A" is not worth more than approximately $25 per ton. The large percentage of fibre in "A" would tend to reduce even this figure, for, as we have pointed out, a high fibre-content has the effect of impairing the digestibility of the feed.

It has thus been demonstrated, in this case, that the higher-priced meal is much the cheaper feed.

THE SILO PLACES FARMING ON A PROFITABLE BASIS

The cheapest and best ration for live stock must contain a reasonable amount of succulent feed. An abundance of suitable pasture is unexcelled, and a substitute for this feed in winter or during a drought in summer is essential for greatest production and profits.

In view of the scarcity and high prices of grains and meals, the silo takes on an increased value. For example: 100 pounds total digestible nutrients in corn silage has a net cost of 54 cents, in bran $2.31, corn $4.02, oats, $4.29, etc., when silage costs $3 per ton to raise and store and other feeds are valued at present wholesale market prices. Even in these times of expensive labor, seed, horse labor and machinery, corn may be placed in the silo at the above cost. Surely this is sufficient reason why every live stock farmer should consider the increase in silage production.

The adaptability of the silo to various parts of Canada depends on the location, varieties of crops which may be grown, and, to a lesser extent, on the class of live stock maintained. No farmer with two or three cows should think of building a silo, but for a herd containing ten cows or more, or the equivalent, a silo may advantageously be erected. Silage is feed pre-eminently suited to the feeding of dairy cattle. It however, is a very excellent and cheap feed for beef cattle, sheep and horses. In the majority of the best live stock districts in Ontario and Western Quebec silos should be on every stock farm. If any particular district is not suited to corn growing, peas and oats, peas, oats and vetches, clover, alfalfa, etc., may be substituted for that crop. This method is upheld by experience at the Experimental Farm, Ottawa.

Silage at $3.50 per ton is cheaper cattle feed than mixed hay at $12 per ton. Corn silage is 30 per cent better than shocked corn from field. The same holds equally true of unthreshed oats or oats and peas saved for winter feed. Silage from peas and oats produce milk 20 per cent. cheaper than oat sheaves, 30 per cent. cheaper than straw and turnips and 40 per cent. cheaper than hay. At the same cost per ton, silage is better feed than roots for beef or dairy cattle. Moreover, considering present labor conditions as well as the cost of harvesting, keeping qualities and cost of storage, silage, where grown successfully, is more economical than roots. Silage needs no pulping or other preparation for feeding. Silage for winter use is in itself the cheapest feed, and it also makes all other roughage and grains more palatable, wholesome and profitable.

Good pasture, if available, is the cheapest summer feed. Where permanent pastures fail, an annually sown pasture of rye or oats and barley may, under present labor conditions, be the cheapest substitute. However, the use of soiling crops or summer silage may be the only available means of providing succulents. As a rule, silage is more profitable and more cheaply grown than are soiling crops and is more cheaply harvested and fed during the busy season. Milk produced on corn silage and green cut alfalfa cost in feed 66 per cwt.; produced on corn silage and mixed hay may cost 70 cents per cwt.; produced on soiling crop (peas and oats) cost $1.04 per cwt. With all lots, the heavy milkers received some grain. Where suitable pastures are not available the summer silo provides the cheapest feed and the greatest profits.

Finally, the farmer with a silo need never fear losing a crop of clover, alfalfa or late-sown grain. Silage making does not depend on the dryness of the weather. The silo is the cheapest storage building on the farm in proportion to the tonnage capacity. The silo allows the carrying of more stock per acre on the farm and is a labor saver, a money maker and a soil enricher.

SAVE YOUR WOOD-ASHES

The experience of many generations of farmers and gardeners has proven the high value of unleached wood-ashes as a fertilizer, especially for clover, corn, farm roots and vegetables and fruit crops generally. Wood-ashes contain no nitrogen and supply no humus, but as far as mineral plant food is concerned there is probably no compounded mineral fertilizer on the market that is more effective and more lasting. They furnish potash, lime, phosphoric acid—the very elements taken from the soil by the forest trees and, returned to the soil they will supply, in the very best form and combinations, the mineral plant food required by our crops.

According to analyses made by the Division of Chemistry, Experimental farms, unleached hardwood ashes, free from sand, etc., will contain between 5 and 6 per cent of potash, about 2 per cent of phosphoric acid and from 20 to 30 per cent of lime. Before the war Germany supplied all the potash used for fertilizing purposes; since that supply has been cut off, potash has tremendously increased in price so that now it is worth almost ten times what it was in the early part of 1914, and as a consequence it has practically disappeared from commercial fertilizers. The potash in 100 pounds of good quality wood-ashes is now worth from $1.00 to $1.50.

Owing to the scarcity and high price of coal, farmers will be burning more wood this winter than has been customary for many years. We counsel them to save carefully the ashes from their stoves, storing them in a dry place protected from the rain. Leached ashes contain very little potash, for this element is readily soluble in water.

The soils most benefited by wood-ashes are light sandy and gravelly loams, and mucks and peaty soils. They are also especially valuable for sour soils deficient in lime. The application may be from 600 to 2000 pounds per acre, preferably broadcasted in the spring on the prepared land before seeding and harrowd in.

DISINFECT

Great care and thoroughness should be exercised in cleaning and disinfecting barns and stable yards in which animals with contagious disease have been kept", says W. H. Feldman, of the Colorado Agricultural College. "Such diseases as glanders, anthrax, rabies and, to a lesser degree, tuberculosis, are highly dangerous to man as well as to other animals and no laxity should be tolerated in cleaning up premises where these and other communicable diseases have been known to exist. The expense of a thorough disinfection is not large and the equipment needed is simple. The following is a list of the most efficacious disinfectants: Chlorid of lime; bichlorid of mercury; formalin; carbolic acid; crude carbolic acid; compound solution of cresol. A pail and the ordinary spraying pump is usually satisfactory for applying solutoins of any of the above."

HORTICULTURE.

CERTAIN STAPLE COMMODITIES. WEIGHT OF BUSHEL AND BAG

The following sections of the Inspection and Sale Act, Part X, have been transferred by the Department of Trade and Commerce to the Department of Agriculture, and will in future be enforced by the Fruit Branch of the latter Department:—

Part X

337. A bushel of any article mentioned in this subsection shall mean, unless a bushel by measure is specially agreed upon, that number of Dominion standard pounds of such article which is shown in this subsection opposite the name of such article:—

Description of Article	Weight in Dom. Standard lbs.
Artichokes .....lb.	56
Beans .....lb.	60
Beets .....lb.	50
Bituminous Coal ....lb.	70
Blue Grass Seed....lb.	14
Carrots .....lb.	50
Castor Beans .....lb.	40
Clover Seed .....lb.	60
Hemp Seed .....lb.	44
Lime .....lb.	70
Malt .....lb.	36
Onions .....lb.	50
Parsnips .....lb.	45
Potatoes .....lb.	60
Timothy Seed.....lb.	48
Turnips .....lb.	50

2. A bag of any article mentioned in this subsection shall contain that number of Dominion standard pounds of such article which is shown in this subsection opposite the name of such article:—

Description of Article	Weight in Dom. Standard lbs.
Artichokes .....lb.	84
Beets .....lb.	75
Carrots .....lb.	75
Onions .....lb.	75
Parsnips .....lb.	65
Potatoes .....lb.	90
Turnips .....lb.	75

338. A barrel of potatoes shall mean, unless a barrel of specified size, kind or content by measure is specially agreed upon, one hundred and sixty-five Dominion standard pounds of potatoes. (1914, c. 36.)

Offences and Penalties

356. Every person who sells or offers for sale by the bag any of the vegetables mentioned in subsection 2 of the section 337 of this Act, shall, in case any bag of such vegetables sold or effered for sale by him does not contain at least the number of Dominion standard pounds required by the said subsection, be liable, on summary conviction, to a penalty not exceeding twenty-five dollars. (1914, c. 36.)

357. Every person who violates any provision of this Part, providing that a bushel of any article shall be determined by weighing, and specifying the number of pounds such bushel shall contain, shall, for a first offence, be liable, on summary conviction, to a penalty not exceeding fifty dollars. 1 E. VII., 26, s. 1.

Section 337A of Part X, relating to the grading of potatoes, is embodied in Chapter 29, being "An Act to amend the Inspection and Sale Act." Copies of this may be obtained on application to the Fruit Branch, Ottawa.

The 90 Pound Potato Bag to be Enforced

While 90 pounds has been the legal standard for a bag of potatoes in Canada for a number of years, and has been generally adopted in most of the large commercial potato districts, there has not until this season, been machinery for enforcing this standard. The Sections of the Inspection and Sale Act respecting the weight of a bushel, bag or barrel of certain commodities have now been transferred for administration to the Department of Agrculture, and the Dominion Fruit Inspectors are charged with seeing that these sections are complied with. Any one, whether grower, jobber, wholesaler or retailer, who sells or offers for sale potatoes in any bag containng less than 90 pounds, renders himself liable t the penalty provided by section 356 (see above.)

The lack of uniformity in the weight of bags of potatoes has been a grievance in the trade for years as in many cases bags of potatoes sold as being of standard weight proved, when actually weighed, to contain as little as 74 pounds and in some cases even less. While in most cases the failure to give the full standard weight has noe been with intent to defraud, the effect on the consumer is the same.

Then, again, many retailers, receiving bags weighing less than 80 instead of the 90 required by law, have perpetuated the evil when selling by the peck or gallon. Instead of selng 15 pounds to the peck, many purchasers have found that they only receive 12 pounds. One purchaser who bought a gallon of potatoes a few days ago found when he weighed them that he had been given exactly 6 pounds 10 ounces instead of 7½ pounds, to which he was enttled; in other words he had paid for 14 ounces of potatoes which he did not get. With the weight of a bushel of potatoes clearly defined as 60 pounds, there is no excuse for a peck of less than 15 pounds or a gallon of less than 7½ pounds being offered to or accepted by any purchaser of potatoes in these measures.

SELECTION AND WINTERING OF BIENNIAL VEGETABLES FOR SEED

(By W. T. Macoun)

By the term "biennial" vegetable is meant one which takes two seasons to produce seed. The vegetable must be stored over the first winter and replanted, for sedd production, the following spring. Some well known vegetables of this class are beets, cabbage, carrots, celery, parsnips, salsify and turnips. Seed from these can easily be be grown in Canada if the vegetables to be so used are kept in good condition over the winter. Some information on the selection and storing of roots and plants intended for seed production is herewith given.

Unless a rigid selection is made each year, of specimens which are true to type it will not be long before a large proportion of the crop will be not true to type; hence great care should be taken to select well-shaped, medium-sized roots, typical of the variety, of beets, carrots, parsnips, salsify and turnips, firm-headed cabbage true to type, firm stalked and disease-resistant plants of celery, and firm, shapely onion bulbs. If this is done and varieties are kept far enough from others so that they will not cross the crop from Canadian grown seed should compare favorably with imported seed in regard to purity, as it does in other characteristics.

The methods of wintering vegetables for seed will vary in different parts of Canada but in most places it will be necessary to give them some protection. When possible, it is best to store them in a frost-proof cellar. But, if necessary, the vegetables may be stored outside, both in small and in large quantities, except n the case of onions, which must be kept dry and stored in a cool place where there is little or no frost.

Cabbage.—One of the simplest and most sucessful methods of wintering cabbage at Ottawa has been to place the plants side by side, heads up, in a trench or pit, the top of the heads beinb about six inches below the level of the ground, the trench being refilled with soil to the bottom of the heads. About a foot of straw is placed over the headsand, when cold weather sets in, from six to eight inches of soil is put over the straw. Forest leaves, no doubt, would preve as satisfactory as straw. When winters are not very severe or wehre a heavy covering of snow is fairly sure, the cabbage may be simply heeled in with the heads above ground and the latter covered with leaves or straw just before severe frosts. There sshould be only a light covering at first t ohelp prevent heating and rotting, and later a heavier application when the weather becomes cold.

Celery.—Good results have been obtaned at Ottawa by wintering celery for seed purposes as follows: The plants are set in a trench deep enough so that the tops of the celery come even with the surface of the ground. The plans are set in a trench deep neough so that the tops of the celery come even with the surface of the ground. The plans are set close together in the row, but each row is separated by soil. Before severe frosts the plants are covered with a heavy

"The Shubert Shipper," is a reliable and accurate Market report and price list, issued at every change in the Fur Market. It is something more than merely "something to read." It is the advisor, friend and sign post to the right road to reliable market information and accurate market quotations. "The Shubert Shipper" is received by hundreds of thousands of trappers and Fur shippers all over North America. Never was a serious misstatements of facts published in "The Shubert Shipper" and this character of accuracy and reliability has demonstrated that such information is absolutely essential to the successful trapper and Fur shipper. You should read "The Shubert Shipper"—we want your name on our mailing list.

layer of straw and when cold weather sets with about fifteen inches of soil. In 1917 nearly every plant came through the winter with the heart in good condition, which is all that is necessary to ensure good crops of seed.

Beets, Carrots, Parsnips, Salsify and Turnips.—When harvesting, the tops are cut to within two inches of the end of the specimen, thus leaving the central shoot. This is better than cutting off the leaves close to the root. The pit in which good success has been obtained in wintering roots in Ottawa is made as follows: A hole is dug the necessary dimensions, six inches deep, in a well-drained place. Poles are laid o nthe ground and covered with boards, leaving about five inches of aiar space under the flooring. A sink hole three feet deep is dug six feet away from the pit. An inverted trough-shaped pipe connecting this hole with the air space under the pit gives a chance for air circulation and drainage of any water that might soak in. The roots are put in bags to separate them better, though this is not always necessary, and piled three tiers high, running to a peak. A peaked roof of boards is put over the pit, high enough above the bags to allow about fifteen inches of straw to be packed in between; over the roof is put a light coat of straw and then fifteen inches of soil. A vent hole nine inches square is left in the centre of the roof. Before hard frost the sink hole is filled with straw and covered with boards and twelve inches of soil. The covering with soil should be deferred until cold weather sets in to avoid danger of heating, and during the winter the temperature inside the pits should be taken if the pits are large. nI many places parsnips may be left in the ground over winter and transplanted in the spring when better results will be obtained than if pitted as they are very hardy.

THE APPLE AS A FOOD

In Eden, at the dawn of time,
To all the world's regret,
The apple tempted Mother Eve,
And lo! It temps us yet.
As mellow King of Tompkins red,
And pippins smooth, invite
The apple-lover passing by
To stop and take a bite.

Thus says Miss Minna Irving in a short poem quoted in a booklet issued by the Fruit Branch at Ottawa giving 160 recipes for the use of the apple. Everybody will agree that the apple is the king of fruits whether fresh, dried, evaporated or canned, but everybody does not know to how many uses the king of fruits can be put as an article for food,—an article moreover that can be made to conserve other foods for shipment overseas. The booklet issued by the Dominion Fruit Branch and which can be had free on application to the Publications Branch, Department of Agriculture, Ottawa, fulfills the useful purpose.

THE USE OF THE APPLE

"Those who make a liberal use of apples will serve the dual purpose of saving for shipment overseas such articles of food as are fit for that purpose and at the same time furnish a useful and valuable food for the household."

"The apple without question is the king of fruits, whether fresh, dried, evaporated or canned, it is a wholesome food, easily prepared, attractive and palatable at all times."

"Always cook apples in earthen or granite utensils and use silver, granite or wooden spoons for stirring. The use of the apple as the basis for all manufactured jam is well known. This is due to the large amount of pectose which it contains. There is no waste to a good apple; even the paring and core may be utilized for jelly. Fruits are classified as flavor fruits and nutritive fruits—the apple comes under both of these heads." Extracts from a little booklet issued by the Fruit Branch of the Dominion Department of Agriculture giving 160 recipes for the use of the apple. The book can be had free on application to the Pub lications Branch, Department of Agriculture, Ottawa.

WATER-CORING OF APPLES

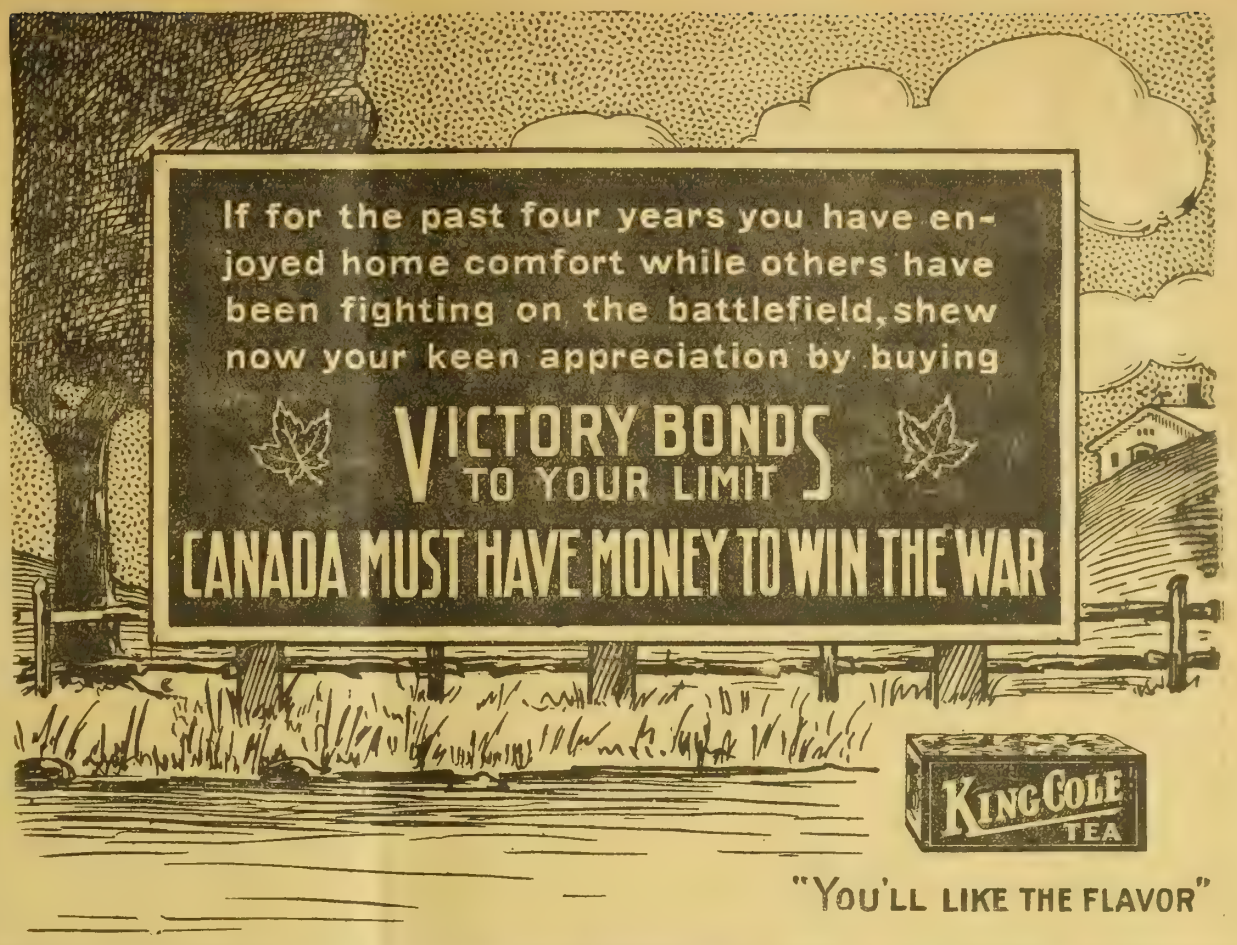
Water-coring is most frequently found in the Baldwin Northwest, Greening and Gravenstein. Leaving the fruit on the trees too late, thus allowing them to be over-ripe, causes water-coring. It is believed that this is due to cool weather checking the respirtaion from the leaves, while the roots continue to absorb a large amount of moisture. The fruit in consequence becomes overloaded with moisture.

Storage of apples in this condition has been found to entirely eliminate the water-coring. Water-cored apples after three months' storage were discovered to be quite normal and possessed good keeping qualities.

RASPBERRY GROWING

I planted some raspberry plants two years ago; they are growing splendidly, but are not bearing much fruit. Should the young shoots that grow up in the spring be cut back or allowed to grow? Should only a few canes be left in each hill?—Farmerette.

Your plants will now be established, and you may expect good returns from now on. It takes about two years for the raspberry to get a start. Cutting back the young canes is not practised by best growers; the canes are left untouched until late winter or the following spring. The thinning out of the rows or hills is not usually done until very late winter or early spring. This is best done when the ground is still frozen over, or before growth starts. Cut out all the old canes leaving only the hardiest and healthiest shoots, and only from five to seven good canes in the hills.



If for the past four years you have enjoyed home comfort while others have been fighting on the battlefield, shew now your keen appreciation by buying

Died of Starvation

Many a Belgian mother could have these words engraved on her child's gravestone—"Died of Starvation".

Perhaps the child has wasted away with Consumption, or has been twisted into a mockery of happy childhood by Rickets, but starvation is at the root of the tragedy.

What else can be expected for a growing child whose daily ration is the bowl of soup and two pieces of bread provided by the United States loans to the Belgian Government?

The only hope for the destitute children of Belgium is that we who can afford three meals a day will be moved to pity and send help immediately. Even a small contribution will help to take some child, sinking under its load of trouble, over to Holland, where with good milk, nutritious food, medical care and loving treatment, he or she may regain health, strength and the wish to live.

GIVE—give until you feel the pinch! Don't wait until someone asks you personally. THIS is personal!

Make cheques payable and send contributions to

BUTTER PARCHMENT—PRINTED OR PLAIN—AT FARMER OFFICE.

DAIRYING.

TEN RULES OF SUCCESS ON THE DAIRY FARM

1. **Keep Healthy Cows.**

Keep a reasonable number of cattle and whether the number be large or small, keep them free from tuberculosis by tuberculin testing; and retest yearly if there are no reactors. Reacting animals should be removed from the herd. The only way to keep the herd clean: Feed no milk from reacting or even untested cows, unless it has been boiled, and no skimmilk returned from creameries, to calves or other stock, unless such milk be first heated up to at least 145 degrees Fahrenheit for thirty minutes (pasteurized), or boiled, thus checking the spread of tuberculosis.

2. **Select and Keep the Good Producers.**

Know what each cow produces over and above her keep, and promptly get rid of unprofitable ones. A 4,000- and an 8,000-pound cow cost about the same to keep. One just pays for her keep, the other nets a profit of $50 to $60 per annum. Ascertain carefully your best market, whether for whole milk or butter fat. Co-operate and reciprocate with your neighbors; nothing else pays quite so well as co-operation. The use of a Babcock tester for determining the butterfat content and the use of a scale for weighing the milk will help to eliminate the poor cow.

3. **Use Only Pure-bred Bulls**

Keep and use only a pure-bred bull. Upon this depends the upkeep and improvement of the herd. There is very little difference in the cost of raising calves of superior and inferior breeding, but there is a great difference in the profits obtainable from superior and inferior cattle.

4. **Feed Liberally.**

Note that a balanced ration of 17 lbs. gives as much butterfat as an unbalanced 21-pound ration, and that continuous silage is sometimes cheaper than pasture. A ton of alfalfa hay equals in food value 60 bushels of oats. Keep in mind that only 100 lbs. of butterfat yearly per cow cost the produced on an average of 35 cents per pound; and that 300 lbs. yearly per cow cost about 12½ cents per pound. Thus does it pay royally to improve the herd.

5. **Produce the Feed.**

It pays better to market your hay and grain in the form of milk, butterfat, steers and hogs. Erect one or more silos, grow alfalfa, corn, sorghum, sweet clover, kafir corn, and soy beans. Beet tops siloed with corn, have made excellent silage. Rotate your crops. Use silage and thus secure milk-producing fodder the year around, which will enable you to keep up your milk yield during the entire year. To store the same amount of dry matter, silage requires two and a half times less space than hay.

6. **Use the Manure.**

Remember that $100 worth of hay (clover) contains $85 worth of plant food; that when this is fed to the cow, three-fourths of the plant food is returned in the manure. $100 worth of cream contains but $1 worth of fertility while $100 worth of butter contains but ten cents' worth of fertility. This makes it plain that feeding hay to the cow leaves nearly all its fertilizing constituents in the manure to be returned to the land, while had the hay been sold, this fertility would have been a total loss to the soil. Either use the manure daily upon the farm or store it in a shallow concrete pit, at a reasonable distance from the barn or milk house, and thus save the valuable nitrogen that the ground, sun, and rain would help eliminate. Keep the pasture highly fertilized.

7. **Keep the Barn Clean and Well Ventilated.**

Keep the barn well lighted, ventilated, and securely fly screened. Keep it clean. Nothing is more important than cleanliness. Keep the cows clean. See to it that small top milk pails are used, and that the milk utensils are well washed and then sterilized. Do not throw down hay to the cows an hour before milking. See that the milkers are healthy and clean persons, who wash their hands carefully before milking. Remove milk pail, when full, at once from barn, and aerate, strain the milk through cotton or gauze; or, better, clarify it with a clarifying machine. From first to last let care be taken to keep the milk clean and free from contamination of any kind. Never be without a dairy thermometer in the milk house, and use it.

8. **Keep the Cows Comfortable.**

Remember that the dairy cow is a daily revenue producer, and is the most valuable asset on the farm. She requires work, and is profitable in proportion to the attention she receives. She is a source of immediate income, and at the same time helps keep up the fertility of the soil. Also remember that the dairy cow is a mother, and that good care, kind and gentle usage, liberal feeding, and healthful environment are necessary if she is to give good profit from her motherhood. As you measure to the cow, so shall it be measured to you in return.

9. **Be Considerate to the Cows.**

During milking time use no profane language. Keep dogs and strangers out of the barn. Become acquainted with and know your cow. It pays. Under no circumstances permit a cow to be kicked or abused by the hired man—it never pays. It is mean and brutal. There always is some reason for a cow being restless. Find the cause and remove it.

10. **Provide Shade and Wind Protection, Salt, and Clean Water.**—J. A. Woodside, California in Hoard's Dairyman.

WHERE DIRT COMES FROM

City health officials, when endeavoring to improve the municipal milk supply, generally lay most stress, when formulating systems of inspection, on the cleanliness of the cow stable and barnyard. The farmer with the clean stables and the clean cows gets the highest score. Now along comes the University of Illinois with the statement that this is all wrong, that the most of the dirt in milk does not come from the stables or the cows, but that the main contamination is from improperly cleansed utensils. Their conclusions, after extensive studies, are summarized in a recent bulletin as follows:

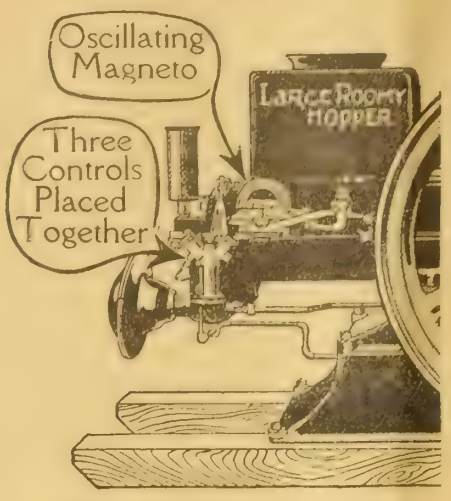
"The fact that the dirt which falls into milk at the barn is readily visible in the milk has led to the conclusion that the barn is the principal source of the bacteria in milk. The results of this study, however, show that it is the utensils, rather than the barn, that are largely responsible for the excessive bacterial contamination of milk. The extent of the contamination of milk by the utensils is strikingly illustrated in one of the experiments in this study: when all the utensils commonly used for handling the milk at the barn and in the dairy were thoroughly steamed, the bottled milk had uniformly only about 5,000 bacteria per cubic centimeter, but as soon as the steaming was omitted the bottled milk frequently contained several hundred thousand bacteria per cubic centimeter.

"The cans used for shipping milk are a particularly prolific source of bacteria when they are washed at the dairy and returned to the farm without being thoroughly steamed and dried. The number of bacteria usually added to the milk by such cans is many times larger than the number that would ordinarily get into the milk at the barn; the addition of a million bacteria per cubic centimeter of milk by such cans is not uncommon.

"A detailed comparative study of the effect of the various other utensils at the barn and at the dairy suggests that the greatest contamination comes from the more complex apparatus, such as the clarifier and the bottle filler. In one of the experiments in this study, it was found that pails added approximately 11 times as many bacteria to the milk as the barn influences, the strainer one and one-half times as many, the clarifier 30 times as many, the cooler 10 times as many, and the bottle filler 60 times as many—a total of 112 times as many added by the utensils as by the barn factors.

"It seems to the authors that in an attempt to produce milk with low germ content too much stress has been laid on practices of minor importance, and the influence of utensils poorly steam-

The Real Practical Kerosene Engine



Some Renfrew Features

is Here at Last

PLENTY of "Kerosene" engines there are, *adapted* for using coal oil, but you can't expect high efficiency from heavy fuel, on principles that apply to the light, volatile gasoline. The Renfrew is not designed from ideas derived from gasoline Engines; it is the result of years of study of the particular and peculiar requirements of *Kerosene*. The

Renfrew Kerosene Engine

is a *real* Kerosene Engine, converting every drop of coal-oil into combustible gas. It gets every whit of power out of the gas by getting it into the cylinder by the quickest route—and hot. No fuel is thus wasted by condensation, as in ordinary engines. The Renfrew way is the practical way; it has solved the Kerosene power problem.

Either on full load or light load, the Renfrew's special Kerosene mixer (designed for coal-oil) ensures a properly mixed charge. The throttle-valve for fuel supply demands a very sensitive governor, and the Renfrew has a special feature to make the governor extremely sensitive.

The special oscillating magneto and igniter makes and fires properly the kerosene mixture.

Note the Renfrew's handy controls, placed close together. The needle valves operating the supply of gasoline for starting, water for scouring, and the kerosene for running are right at your finger tips making adjustments easy as winding a watch.

These and more interesting features are fully described in our illustrated free catalogue. There is a full line of skid, truck and wagon types in sizes 3 to 14 h.p. Write for catalogue today.

Renfrew Jr.
Gasoline Engine
1½ h.p.

For operating grindstone, pump or cream separator. Has secondary pulley operating at low speed; speed changing device; air cooled; also 1 h.p. and 2 h.p. sizes. *Write for catalogue.*

ed and not dried has been commonly neglected."

IT PAYS TO RAISE YOUR OWN STOCK

1. It is more profitable to breed and rear good young stock to maturity than to purchase the average cows for sale, which are usually the animals least profitable and desirable in the neighbor's herd.

2. The cheapest way of building up a good herd is to raise it. The feed costs of good rearing in Canada range from $16 to $24.30 for 6 months calves, $24 to $45 for 12 months calves, and $37 to $74.30 for 24 months heifers, the variation depending on methods of feeding, feeds available and market values of these feeds.

3. Calves of poor type and breeding are not worth rearing, but good calves properly bred will be worth at least 30 per cent. and up to 100 per cent. more than their feed cost at two years of age.

4. Calves of good size, strong constitution and large capacity will, on the same feed, make greater growth and better gains than small, weak, narrow individuals.

5. Good rearing of calves is most profitable as shown in such results as:

Earlier maturity in size.

Earlier maturity in profitable production.

Greater production throughout the whole life time.

More valuable and in greater demand at the highest price.

Healthier stock.

More durable animals.

Better able to consume most profitably all cheap farm-grown roughages and convert these into milk.

6. The calf reared on its dam costs 25 to 50 per cent. more than the pail-fed calf, and the more productive the cow the greater will be the charges against the calf.

7. Pail-fed calves, reared to six to eight months largely on whole milk, make gains which cost $14 to $18.75 per cwt., which is several times the cost when a properly-fed substitute for whole milk is used.

8. Skim-milk fed sweet and at a temperature of about 90 degrees Fahr. is the best single substitute for whole milk and may reach a value of 70 cents per cwt. or more in feeding young calves. However, skim milk may be improved by the addition of a good cream substitute such as flax-seed jelly, oatmeal, or a well-balanced calf meal.

9. Buttermilk, if fed uniformly as to acidity and temperature, may have a slightly greater value than skim milk. Great caution must, however, be taken to start calves at a greater age and very gradually.

10. In feeding calves six to eight months of age on rations composed largely of skim milk or buttermilk and a good cream substitute, gains may be made at a cost of feed amounting to from $2 to $7.15 per cwt., this amount varying with the character and price of meal and the ruggedness and thrift of the calves.

11. If well started on mothers' milk, calves may be well reared on calf meals without whole or skim milk. However, greater care and attention must be paid to these calves, and even so, gains cost from $5 to $15.41 per cwt., or nearly double the cost where some skim milk is used.

12. There are many excellent calf meals on the market in Canada. The Canadian manufactured meals are as good as and generally decidedly superior to imported meals, due not only to the palatability of the ingredients and the chemical balance, but even more to freshness and freedom from mustiness.

Of the Canadian-made calf meals used the three which in total gains have given excellent satisfaction are Royal Purple, Gold Dollar and Caldwell's.

Providing the necessary ingredients are available, it may often be more economical for the feeder to mix his own calf meals. If properly done, the resulting gains in weight of the calves may be nearly as great, and often at a much reduced cost.

13. In order to rear the best and cheapest cows, all pail-fed calves should be taught to eat, at an early age, cheap and nutritious farm-grown roughages and grains. The best roughages are grass, fine alfalfa or clover hay, swede turnip, mangels and ensilage. Of the grains, oats and barley are unexcelled.

TO HAVE BETTER CALVES

1. Give suitable feeds and avoid overfeeding.

2. Feed regularly and carefully.

3. Keep calf pens clean and freshly bedded.

4. Avoid in every possible way all such infectious diseases as scours, tuberculosis, black leg and abortion.

5. Destroy parasites such as worms, ringworm and lice.

—Experimental Farms Note.

MILKING THE KICKER AGAINST HER WILL

The question as to how to handle a kicking cow has been brought up in several recent issues of your paper, but none o fthe methods is simple and effective enough. However, as this seems to be a useful point in cow handling, without criticism of any of the other methods, I will tell of a device with the aid of which I successfully milked a kicker and a fighter for several years.

I built a feed box to the wall of the barn and made ti high enough so that the cow's head would be raised just a little while eating. I made this box just a little wider than the cow and ran a one-inch by six-inch board from the box back along the cow's side to two posts, the forward post being just behind the cow's hip, and the other only far enough back to allow a bar to slip between the two posts. When I put feed in the box the cow would readily go into the brake. I would then slip a bar behind her at about the height of her hip and by placing my hand on her hip and gently pushing her over until her weight was on the off leg she would back the near leg, when I would slip a second bar between her legs as high as would be comfortable. Then I would get my stool and take my time. The cow was comfortable, and although she would try to kick several times during each milking I never lost a drop or got off my stool. The brake enabled me to buy a vicious cow for ten dollars because she "couldn't be milked." She never stopped kicking, but did stop trying to hook. E. M. G.

BERNARD FRICTION PULLEY

Nowadays, in this age of progress, life and labor saving devices, the necessity of a friction pulley on a gasoline engine is freely admitted. A friction Pulley is a great factor in saving belts and machines, and more, it is a safeguard to lives of men working with an engine.

Let the
"Alpha" Gas Engine
do your work

AN ALPHA Engine is a big help on the farm these days when labor is so hard to get. It's so reliable, too. Always on the job. Never quits. Never gets laid up. Never takes a vacation. You can always depend on an "Alpha."

Thousands of Canadian engine-owners swear by the ALPHA because they have found that it can be depended on at all times and under all conditions. It is sturdily built. It is simple in construction. It is powerful. It runs on either gasoline or kerosene and develops its full published horse power on a minimum amount of either. If you want an engine that you will be thoroughly satisfied with, put your money into an ALPHA.

Ask for catalogue, prices and complete information. Made in twelve sizes, 1½ to 28 H. P. Each furnished in stationary, semi-portable or portable style, and with hopper or tank-cooled cylinder.

SAVE THE MILK CANS

Dairy farmers have not been in the habit of looking upon tin as an important necessity in their business, but when we stop to think of it we know that in the milk business nothing is more universally in evidence than the tin can.

Now the shortage of tin, which must be imported, is so great that dairymen may have to get along with their present supply of cans. It is probable that there are many cans on the retired list that with small repairs may be brought back into use. Careful handling and thorough drying after washing will make all cans last longer. Cans that are lent never seem to wear so well as privately owned containers.

Shippers of cream can cut down their can requirement and their shipping charges by skimming a richer cream. Ten cans of thirty-five per cent. cream contain as much butterfat as seventeen cans of twenty per cent. cream. The richer the cream the more skim milk is left on the farm.

A RECORD PRICE

G. E. Day, Secretary-Treasurer of the Dominion Shorthorn Breeders' Association, writes:—On October 3rd, a load of Shorthorn yearling steers sold at $19.60 per cwt. on the Chicago market, a record price for that market. The steers averaged 1017 lbs. and were bought for the Nagle Packing Company, New York City.

LIVE STOCK.

UNFINISHED CARCASSES

The British Ministry of Food states that so long as space for transatlantic cargoes is so very limited as at present it will be unable to accecpt unfinished beef carcasses for transportation to Great Britain or the Allies. Beef of this class includes a considerably larger percentage of bone and waste than does the well-finished article and at the same time is more difficult to handle and less easily preserved. For somewhat similar reasons the Ministry states that it will pay the top price only for bacon which is cut from select hogs weighting between 150 to 250 pounds, live weight. The beef carcass, in order to be favorably considered, should weight at least 500 pounds. It is of the greatest importance, therefore, that our farmers and feeders should make every effort to finish their stock before marketing. If any are in such a position that they cannot finish it themselves they should do their best to place it in the hands of those who can. The situation in Eastern Canada is unquestionably good so far as roughage is concerned and we are just finishing harvesting one of the best crops of grain that we have ever taken off and, while Western Canada has suffered somewhat from drought and frost, conditions have improved immensely since July last. I feel justified, therefore, in asking the farmers throughout this country to make a special effort to market only finished stock within the weights indicated.

Production is exceedingly important but quality, condition, and finish are even more essential if we are to ensure our products reaching the markets of Great Britain and our Allies as is evidenced by the statement in the first paragraph. There is, however, another reason and to our farmers and in fact to all Canadians an almost equally important reason why we should do our utmost to put only meats of the best quality and finish on the export market at the present time and in the immediate future. Practically all our bacon surplus and a very large portion of our surplus beef must find its outlet in Great Britain. It, therefore, we would retain our place on the British market both now and in the future it is apparent that we must maintain the good reputation we already have for our superior article of bacon and improve our present status as a beef producing country and, since the very existence of our bacon industry and in no small measure the continued prosperity of our beef producing interests depend upon our standing in the British market. I make this appeal feeling convinced that the standard set this year may easily determine our reputaation and largely establish our commercial position in these lines for not only the immediate but also for the more distant future.

It seems then that I am not exaggerating when I say that upon our handling of this situation at the present time depends in no small degree the life of our bacon and beef trade and I feel that I am not asking too much when I urge upon every individual farmer and feeder the importanace of each one doing his utmost to ensure only finished animals going to the block.

THE RAISING OF CALVES

(Experimental Farms Note.)

This subject could be very well divided into three ports, viz., (1) Breeding, (2) Feeding, and (3) Housing.

(1) Breeding,—In order to get the most profitable results for feed consumed and labor spent in raising calves it is necessary to see that the breeding of the calves is of the best, that their sires and dams are good individuals of the breed which you are working with, and that they have good records of performance behind them. This applies to beef breeds as well as dairy.

(2) Feeding,—As soon as the calf is dropped it should be separated from its dam and not given any food for twelve hours, when it will have developed a good appetite and be ready to take its first food which should consist of 5 pounds of its mother's milk. This should be duplicated in 12 hours which will make 10 pounds per day, which amount the calf should receive for the first two weeks. At the end of two weeks the calf should be getting 6 pounds twice a day, which should be continued for three weeks, at the end of five weeks commenc efeeding the calf a small quantity of skim-milk mixed with the whole milk, gradually increasing the skim-milk and decreasing the whole milk until at the end of the seventh week the calf would be getting 15 pounds skim-milk per day. This amount should be continued until the calf is six months old. As soon as the calf is getting skim-milk alone, there should be added to the milk a small quantity of equal parts of oil cake and ground oats with hulls taken out. This is a good cream substitute which partly takes the place of the butter fat which is lacking in the skim-milk. An ounce of this mixture, at first, twice a day, is sufficient, but should be gradually increased as the calf develops. When the calf is six or seven weeks old, there should be placed before it some nice, sweet, clover hay and equal parts of ground oats and bran which it will soon learn to eat. It should have as much of this feed as it will eat up readily twice a day. Always be careful that there is no feed left over in mangers and that all pails and boxes in which calves are fed are kept perfectly clean and sweet. They should be fed an accurate quantity at regular times which is very important in keeping the calf's digestive organs in the best condition possible, which is very essential for rapid anad robust development.

(3) Housing—All quarters in which calves are kept should be clean and they should be given all the room possible so as to allow chance for exercise. They should always be well bedded with plenty of light and good ventilation, so that the calf will develop a good strong constitution in order to be a healthy acquisition, when grown, to the farm herd.

SELECTION OF THE BOAR

In these days when pure bred males are plentiful and reasonable in price, there is practically no excuse for using anything but a pure bred boar, even though the sows be merely grades. Always select a lengthy, heavy boned boar. Such a boar will get pigs which grow faster and make cheaper gains than the pig from a small, short bodied boar.

The age at which a young boar may be first used depends largely upon his development. Some boars may be used to a few sows when not more than seven months old without apparent injury.

Probably nothing is more essential to the health and vigor of an animal than exercise. In summer it is usually a comparatively simple matter to provide exercise in a paddock or pasture lot, but in winter it is more difficult. A roomy pen should be provided, with a sheltered outside yard. Sometimes a boar can be fed in a well-littered barnyard, which makes a very good arrangement when practicable.

It requires good judgment to keep a boar in the best possible condition. Extremes are to be avoided. The overfat boar does not make a satisfactory sire, as a rule, and a half-starved boar cannot transmit vigor and constitution to his progeny to the same degree that he would if properly managed. To get the best results the boar should be in fair flesh. A reasonable amount of fat on his bones will do him no harm if he gets sufficient exercise.

An exclusive meal ration will not give good results. Equal parts ground oats and wheat middlings make a first-class meal ration. It gives sufficient bulk, and is nutritious without being heating or too fattening. Ground oats middlings, or bran may be used singly to dilute corn or other heavy meal; in fact, a very great variety of grains may be fed as long as the feeder uses judgment.

But a boar needs something besides grain and meal to be in his best condition. Skim-milk anad butter-milk are excellent, and will give good results with meal even if nothing else is used. In winter, roots of any kind are much relished. They have a cooling, laxative effect, preventing constipation and keeping the animal thrifty and vigorous. If roots are not available, alfalfa hay of fine quality may be used to give bulk to the ration. Some feed the alfalfa hay dry in racks, and others prefer to cut it and soak it with the meal ration or scald it with the boiling water before mixing with the meal.

Summer management is usally simpler than winter. A pasture lot provided with shade is on of the best places to keep a boar. The grass, alfalfa or clover, or whatever the pasture may consist of, will furnish the bulky succulent feed necessary for health, and gathering part of his food from pasture compels the boar to take exercise. If it is not possible to provide the pasture, he should be liberally supplied with green feed in his pen.

FINISH YOUR BEEF

The Hon. T. A. Crerar, Minister of Agriculture, calls upon Canadian farmers to finish their beef animals for market. Too many light weight animals have been slauaghtered.

"It is of the greatest imoprtance," says Mr. Crerar, "that our farmers should make every effort to finish their stock before marketing, so long as space for trans-atlantic cargoes is as limited as at present. The British Ministry of Food will pay the top prices only for bacon which is cut from select hogs, weighing between 150 anad 250 pounds, live weight. The beef carcass, in order to be favorably considered should weigh at least 500 pounds.

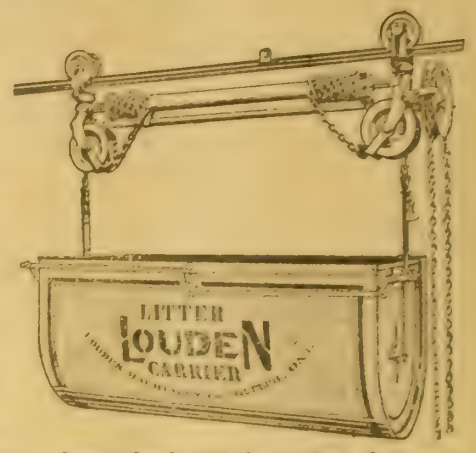
Sheep should not be compelled to drink from a muddy, scummy pond.

Co-operation is enlightened selfishness—the recognition of the fact that one's neighbor is not a competitor but a friend.

LOUDEN

LITTER CARRIERS

SAVE MONEY
SAVE LABOUR
SAVE TIME



Save your strength for more important matters. Why push a wheelbarrow through snow, slush, mud or accumulated matter, when a LOUDEN Roller Bearing Litter Carrier will do four times the work with half the labor?
The LOUDEN Carrier with its patented roller bearing track wheels and powerful worm gear hoist will elevate and carry a heavy load with less effort than any other carrier made. It will repay you many times over.

Write to-day for Catalogue—It is Free

THE LOUDEN LINE includes Stalls and Stanchions, Feed Carriers, Animal Pens of all kinds, Barn and Garage Door Hangers, Hay Forks, Carriers and Slings, Power Hoists, Horse Barn Equipment, Water Bowls, Cupolas and Overhead Carrying Systems for Factories, etc.

The Problem of Winter Feeding

You are now facing the problem of winter feeding and it is one worthy of great consideration, if you value the health of your stock and hope to keep them in proper condition until the Spring.
Once the animals are tied up for the winter they are immediately deprived of exercise, green grass and various herbs, which they have been accustomed to during the Spring, Summer and Fall while on the free range—and which act as natural tonics to the digestive organs, thus helping the animals to assimilate the food they eat. Stall feeding is entirely different and if not properly carried out will uncondition any stock. Dry or winter feed even of the best, if not mixed with ingredients to promote digestion, soon causes stomach troubles, and your animals cease to thrive, with the result that the Spring finds your herds and your profits in grave danger of being depleted. Don't risk having unfit stock

FEED

INTERNATIONAL STOCK FOOD TONIC

TO ALL YOUR ANIMALS DURING THE WINTER

FOR YOUR HORSES

Keeps horses thrifty and healthy with nice glossy coats. If you have a horse that is hide-bound, rough, off its feed, or in a run-down condition, use INTERNATIONAL STOCK FOOD TONIC. The remarkably quick results obtained will be evident in the improved all round condition and appearance of the animal.

FOR YOUR COWS

INTERNATIONAL STOCK FOOD TONIC tones up the sluggish digestive organs of your milch cows, assisting them to extract all the milk producing substances from the food. The cows thus give a larger flow of richer milk.

FOR YOUR HOGS

INTERNATIONAL STOCK FOOD TONIC increases your hog profits by giving quick growth and by keeping hogs healthy. It is not what a hog eats but what is digested and assimilated that means rapid growth and profitable feeding.

International Stock Food Tonic is just the thing for young stock. It helps to promote rapid growth and makes all stock more productive. The best recommendation for International Stock Food Tontic is the number of farmers, ranchers and stockmen who use it. From all parts of the country come unsolicited testimonials telling us about the great results that have been accomplished by the use of this tonic.

READ THESE LETTERS

Orangeville, Ont., May 16th.
Some people asked, the other day—in fact, people are asking me every day—what has made my horses' coats so nice and glossy. I think once you feed a horse with INTERNATIONAL STOCK FOOD TONIC, and get him in good shape for the spring work, he will stay fat and have a better coat on after using the INTERNATIONAL STOCK FOOD TONIC.
(Signed) Elgin I. Holmes.

April 13th, Listowel, Ont.
I am a farmer and stock-owner and I must say this: There is no better animal tonic than your INTERNATIONAL STOCK FOOD TONIC to keep stock in good shape. I use it all the time, and if all farmers would do likewise, they would do well.
(Signed) I. J. Bender.

South Melfort, Sask., Dec. 6th.
I have been using your INTERNATIONAL STOCK FOOD TONIC for over seven years, and it is just as good as you say it is.
(Signed) F. Kennedy.

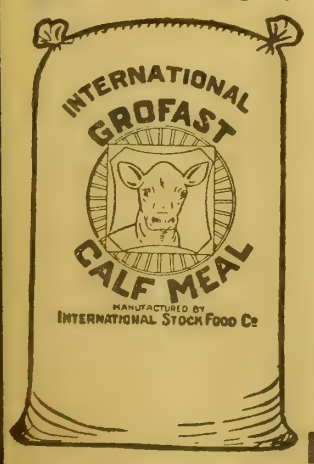
Waterville, Que.
I have always found your STOCK FOOD to be a valuable TONIC on my farm, and I have now used it for the past five years and have not had a sick horse or cow for one single day in that time. My six cows are as fat and healthy now as at any time in the summer and are always ready for their feed, and am certain they are giving more milk than other folks' cows who don't feed INTERNATIONAL STOCK FOOD TONIC, as it keeps the animals healthy and in good shape, whether horses or cows or pigs.
(Signed) Wm. H. Day.

Paisley, Ont., R. R. No. 3
Kindly ship me at once by freight twelve pails of INTERNATIONAL STOCK FOOD TONIC. You will note this is the second twelve-pail order I have bought this season. I have used a lot of INTERNATIONAL STOCK FOOD TONIC, as you will see by your records, and find its use very profitable to me.
(Signed) J. H. Turner.

Calumet Island, Que.
I have been using your INTERNATIONAL STOCK FOOD TONIC on my horses, cattle and hogs all winter; it's certainly a great blood purifier; my stock is in as good condition as they would be in the summer months. I would not want to be without INTERNATIONAL STOCK FOOD TONIC again.
(Signed) W. J. Deroeiur.

Terra Cotta, Ont., October 31st.
I have used your INTERNATIONAL STOCK FOOD TONIC for fifteen years, and am using it to-day, that expresses my opinion better than words what I think of INTERNATIONAL STOCK FOOD TONIC. I think it is the best ionditioner for horsese in the world. And my experience leads me to believe it makes your horses disease proof.
(Signed) Lorne L. Plant.

Aneroid, Sask.
I have used INTERNATIONAL STOCK FOOD TONIC FOR FIVE years now and it is a FINE PREPARATION for all animals, especially for overworked horses to build them up again, besides which, it is reasonabel to purchase.
(Signed, E. Cotterell.



That International Stock Food Tonic is a winner cannot be doubted. The best way however to convince yourself is to try it. For sale by dealers everywhere in convenient sized packages. 60 cents, $1.20, $1.75, or 25 pounds pails for $3.75 each.
The cost to use is next to nothing—3 feeds for 1 cent.

THE HORSE

ACUTE DIGESTION

This kind of indigestion, with engorgement, may arise from repletion with solid food or from the evolution of gases arising from the fermentation of food. It is often very difficult to determine whether the trouble is confined to the stomach or whether the intestine also is involved. This is not very important, as affections of this nature are concomitant, and require the same treatment as far as treatment by an amateur is concerned. When the trouble is confined to the stomach the modern veterinarian can act directly by the use of the stomach pump.

Causes.—The usual causes are: too much food; food swallowed greedily without proper mastication; feeding immediately after severe and long continued exercise; severe exercise too soon after a hearty meal, especially if the horse has been given something to which he is not accustomed; sudden changes of food; and drinking excessive quantities of water too soon after a hearty meal. It is not uncommon to see a well marked case for which no well marked cause can be given.

One of the most frequent causes is what may be called mistaken kindness on the part of the owner. A horse that has been idle for some weeks and has been given no grain is unexpectedly required to go a journey or do a day's work. In order to fortify him for the usuaual exertion he is given a full feed of grain, hitched and driven or worked. The stomach is charged with grain to which it is not accustomed, and the horse performing physical work to which he is not accustomed. These two conditions in many cases cause "acute indigestion." When horses under the conditions noted are required for service care should be taken to fede very lightly on grain until after the service has been performed. Then, in order to compensate for the extra labor, they should be fed a moderate allowance of grain for a few days.

orses whose digestive organs are either congenitally or temporarily weak, or whose organs have become weakened by disease, also those horses which are weak, anaemic, poorly fed and emaciate danimals, or very young or very old animals and animals recovering from disease, etc., are especially predisposed to digestive trouble.

Among the direct irritating causes are green food, food and drinks that are hot, or that are frosted, unclean or partially decayed foods, mouldy hay or grain, matters undergoing fermentation or decomposition. as decomposing roots, fruit, grass, or germinating grain.

In cases where no well marked cause can be given we must decide that there is some temporary weakness of the digestive organs, which, while producing no visible symptoms, render the horse in that condition in which indigestion is easily produced. At the same time, an attack seldom occurs except in horses congenitally predisposed, that cannot be traced to carelessness or ignorance in feeding or usage.

Symptoms.—The symptoms of many diseases of the digestive organs simulate each other so much that it is often difficult to say, in the early stages, just what the disease is. Hence, the advisaiblity, when convenient, of procuring expert attention, as an attack of a serious nature may be mistaken for a simple ailment, and if not energetically and skillfully treated early may reach that stage in which treatment will be of no avail. There are many cases in which the symptoms are not typical.

The first symptoms usually are uneasiness, dulness, stamping of the feet, lying down, probably rolling, rising again, looking toward the flank, lying down again, etc. The pulse at first increases in force and frequency, but if relief be not given in a few hours loses force while still increasing in frequency.

In many cases these symptoms are preceded by a semi-diarrhoea, the horse voiding semi-liquid faeces frequently, but in small quantities.

There is usually more or less well marked fulness (bloating) noticed, more marked on the right side. In some cases, however, the formation of gases is confined to the stomach, when little fulness of the abdomen is apparent. Eructation of gas is not uncommon, and in rare cases there is actual vomition of small quantities of ingesta. Either of these symptoms indicates a very esrious case. When relief is not given the symptoms increase in intensity.

In some cases death occurs in one or two hours after the first symptoms are noticed, while in others twenty-four to forty-eight hours, or even longer, may elapse before either recovery or death takes place. In cases that do not yield to treatment the violent symptoms are usually succeeded by dullness and stupor. The pulse becomes weak and very frequent, almost or quite imperceptible at the jaw. The patient will either stand, or walk aimlessly around the stall or paddock, breathing shortly and frequently and often perspiring freely, the visible mucous membranes highly injected, the eyesight evidently impaired. This indicates that inflammation of the stomach, and probably also of the bowels, has resulted and the patient will probably remain standing, or wander around until he falls and expires. In the meantime there is usually little or no passage of faeces, and the intestinal murmur is absent or of a metallic sound.

Treatment.—Place in a large, comfortable box-stall or small paddock. Do not force exercise nor prevent him from lying down. Give 2 to 3 oz. of oil of turpentine (according to size of patient) mixed with a pint of raw linseed oil, as a drench. It is good practice to apply to the abdomen cloths wrung out of hot water and give injections of warm soapy water per rectum. If the pain be severe give 1 to 2 oz. of chloral hydrate or 1 to 2 drs. of the solid extract of belladonna, or 1 to 2 oz. of the tincture of belladonna in a pint of water as a drench. Do not give opium in any form, as it checks the action of the bowels, which we want to encourage. Watch him closely and if he becomes stall-cast relieve him. If relief be not obtained in two hours repeat the dose, and it will be wise to get expert attention as soon as possible. If this cannot be done continue treatment, repeating the doses every two hours as required, but after the second dose of turpentine mix it with new milk instead of oil. When bloating is excessive it is good practice to puncture at the most prominent part between the point of the right hip and the last rib, but for this purpose it is necessary to have an instrument called a trocar and canula. It is good practice to administer a purgative of 6 to 9 drs. of aloes and 2 drs. ginger, either moistened, rolled into cylindrical shape an dwrapped in tissue paper and administered as a ball, or mixed with a pint of cold water and given as a drench after the acute symptoms have passed.

The patient should not be exercised until the bowels have regained their normal condition after the administration of the purgative, and he should be very carefully fed and lightly worked for a few days afterwards.—J. Hugo Reed, V. S.

CHRONIC INDIGESTION

This kind of indigestion without engorgement, is caused by improper food, imperfectly masticated food due to the process of dentition, diseases or irregularity of the teeth, voracious feeding, irregularity in feeding, debility or partial inactiviay of the digestive glands.

Symptoms—A capricious appetite, and often a tendency to eat filth; usually increased thirst; the animal becomes hide-bound, has a dry scruffy skin; irregularity of the bowels; general unthriftiness, dulness and more or less marked inability to perform work. Whn caused by imperfectly masticated food, the cause can usually be told by the appearance of the faeces. Colicky pains are sometimes present an hour or so after feeding.

Treatment.—Ascertain and remove the cause if possible. In all cases examine the mouth and teeth. If they require attention and the owner has neither the necessary instrument nor the skill to correct the fault he should take the horse to his veterinarian.

Where the fault is not in the mouth, and the animal be not too weak, give a laxative of 6 to 8 drams of aloes and 1 dram ginger.

(We may here state that in all cases where a laxative or purgative is to be given, and prompt action is not necessary, it is wise to prepare the patient by feeding bran only for 18 to 24 hours. In all cases after the administration, the animal should be given rest, and bran only to eat until purgation commences, which is usually 20 to 24 hours or longer. When the first does fails to act, a second should be given in about 48 hours).

After the bowels have regained their normal condition mix equal quantities of powdered sulphate of iron, gentian, ginger, nux vomica and bicarbonate of soda, and give a tablespoonful three times daily. Give food of good quality in small quantities, and as digestion improves gradually increase the quantity until the desired amount can be fed.

In speaking of the different forms of

The Way to Tell a Good HARNESS

Every manufactured product that is worth it, is marked by the maker with his *trade-mark*. Harness is no exception. To be certain you get BIG VALUE and get a set you can DEPEND UPON, get the famous TREES HARNESS, sold all over Canada as IMPERIAL BRAND, and trade-marked with the Horse's Head in the Horseshoe. Watch for this trade-mark in buying and always ASK YOUR DEALER for IMPERIAL BRAND HARNESS. We prefer to have you buy it from your dealer but, if he hasn't it, write direct to us. Prices range as low as $22 a set, single, complete, and $39 a set for team, without collars. Harness cheaper than this is not safe to buy. Our cheapest harness is SOLID VALUE and, in its class, is by far the best for the price. Our Buggy Special at $28 is one we strongly recommend for strength, good looks and long service. We have a stock of everything in the harness line and can supply you promptly. It only costs 3 cents to write us and find out all you want to know.

ligestive troubles in horses modern veterinary writers generally speak of hem as different forms of colics. We hall speak of them by their old familiar names, as we think this will be nore readily understood by those who nay study the information given in his bulletin.—J. Hugo Reed, V. S.

CONSTIPATION

A partial or complete inaction of he bowels may be looked on more as a symptom than as a disease of itself.

Causes.—An absence of laxative ood, change from green to dry food, hange from hay to straw, a partial inction of the glands of the intestines, a partial or complete paralysis of the oats or the intestines. The bowels of ome horses appear to be naturally orpid.

Symptoms.—A dulness, impaired appetite, passage of small quantities of ard, dry faeces, and in some cases light colicky pains, an alteration in he nature of the intestinal murmur nd sometimes an absence of sound.

Treatment.—In many cases a change o more laxative food will correct the ault. If colicky pains eb present the dministration of 1 to 1½ oz. each of he tincture of belladonna and sweet pirits of nitre in a pint of cold water, s a drench, will usually be effective. Opium in any form must be avoided as t tends to increase constipation. As in nostly all cases there is partial or omplete paralysis of the muscular oats of the intestines, active purgatives must eb avoided, as they cannot ct while the paralysis continues. The aralysis must be overcome by the dministration of 1½ to 2 drs. powderd nux vomica three times daily and ectal injections of warm soapy water. When the paralysis is overcome, vhich can be told by the passage of aeces, even in small quantities, and return of the normal intestinal murmur, a laxative of 1 to 1½ pints of raw inseed oil should be given and the anmal fed on laxative, easily digested ood.

Note—The intestinal murmur can be etected by holding the ear to the anmal's flank. In order that a person nay be able to detect an abnormal ound, or the absence of sound, he nust, of course, be familiar with the ormal sounds. This familiarity can e gained only by listening to the ounds in the abdomen of a healthy orse.—J. Hugo Reed, V.S.

IMPACTION OF THE COLON

Causes.—Horses over abundantly ed or fed upon food containing large uantities of indigestible or woody bre, as over-ripe hay of any kind, are iable to suffer from an accumulation f such matter in any part of the large ntestine, especially in the large colon. his condition is not uncommon in orses whose ration has been suddenly changed from hay to straw. It may e due to an unexplained weakness of he digestive organs, or partial inactivty of their plands, want of exercise, or ny sudden change of food. It is not ncommon in horses that do not thorughly masticate their food, due to too reedy feeding, irregularities of the eeth, or diseased liver, or, in fact, to ny inaction or partial inactive condiion of the glands of any portion of he digestive tract.

The same causes largely operate in xciting the various diseases of the diestive organs. It may not be considred out of place to repeat that when orses are intelligently fed and exerised digestive diseases seldom occur. are must be taken that the quality of he food is good, that the quantity is in ccordance with the size of the animal nd the amount of work performed, nd any change of diet is made gradally.

It may also be wise to remark that ll horses over five years old, and oftn those even younger, would be better if they had their teeth examined, nd, if necessary, dressed by a cometent man once every year. This tatement will probably be considered by some as extravagant, but it is a fact nevertheless, and the horse owner who attends to this matter regularly is amply repaid for the outlay. His horses can then masticate their food more thoroughly and without irritation to tongue or rheeks, and consequently will thrive better, look better, and be less liable to the rlass of diseases under disrussion. Many will say, "My horses' teeth are all right; the animals eat well and keep in good londition." This may be qhite true, bdt it does not follow that beladse a horse lonsumes his food without apparent difficulty and without quidding, that his teeth are in first-class condition. If examined, there will, in most cases, be seen or felt, sharp points on the inner margin of the lower molars, and the outer margin of the upper ones. These projections, while probably not materially interfering with mastication, cause more or less irritation to the tongue and cheeks, make mastication more or less unpleasant and warrant the expense of having the cause of irritation removed.

Symptoms.—The symptoms of impaction of the colon are not usually alarming. The conditions may be present for some time without any serious symptoms being noticeable. It may be noticed that for a day or two the animal has not voided his normal quantity of faeces, while that voided has been somewhat dry; also that his appetite, spirits and ambition have not been quite normal. He will probably now begin to show more or less well marked colicky pains, become restless, lie down, get up again, etc., and show more or less general uneasiness, but seldom shows violent symptoms. The pulse, in most cases, is slightly increased in force and frequency, and, as the disease advances, it increases in frequency but decreases in force. The mucous membranes are usually injected. A peculiarity of the symptoms usually shown is a desire to sit upon his haunches, or when standing to press his croup against some stationary object. He resists the introduction of the hand, or injections into the rectum, and, if the ear be placed against the abdomen, an absence of the normal intestinal murmur will be detected—there will be either an absence of sound or sounds of a metallic nature. There will be little or no faeces voided, and a fulness of the abdomen, better marked on the right side, will be more or less evident. When relief is not afforded, the symptoms increase in intensity, gases form and increase the fulness of the abdomen, the pulse becomes more frequent, but weaker—often almost, or quite, imperceptible at the jaw—and the patient either walks aimlessly about or throws himself violently down, rolls and struggles. Rupture of the intestine may now take place (especially in cases where the symptoms are violent) which causes death in a few hours, or inflammation of the bowels results, which is equally as fatal, but not often so quickly.

Treatment.—As there is always partial or complete paralysis of the coats of the intestines, the administration of large doses of purgative medicines must be avoided until the paralysis is overcome. It is good practice to administer a laxative, say, 6 drs. of aloes and 2 drs. ginger, or a pint of raw linseed oil to a horse of ordinary size. Follow up with 2 drs. nux vomica every eight hours.

Combat pain by giving 1½ ozs. chloral hydrate, or 2 drs. solid extract o fbelladonna, or 2 oz. of tincture of bella donna and sweet spirits nitre in a pint of water as a drench every two or three hours as the symptoms indicate. Do not give opium in any form, as it increases the constipation.

Remove the contents of the rectum by hand and give injections of warm soapy water per rectum every three or four hours. Some recommend the injection of a solution of aloes into the rectum, aout 1 oz. to a gallon of water, and when the patient will retain the fluid for a considerable time it may give fair results.

If gases form and the patient becomes bloated, give 2 to 3 ozs. of the oil of turpentine in a pint of raw linseed oil. This may be repeated every two hours, but after the first dose it will be wise to mix the turpentine with new milk instead of oil in order to avoid too much purgative medicine.

Note.—In recommending doses we always mention the proper dose for animals of ordinary size. Very small or very large animals should be given doses in accordance with their size.—J. Hugo Reed, V. S.

FLATULENT COLIC

Colic in which there is the formation of gases in the intestines, principally in the large intestine, is known as "flatulent colic." This form may be diagnosed from the spasmodic form by the symptoms being less alarming and violent but of a more persistent character; there are practically no periods of ease. The symptoms of pain are constant, but vary in intensity. Emission of gases per rectum is often noticed, and, particularly if the small intestine be involved, there may be eructations of gases and in reasonably well marked cases a more or less well marked distension of the right side of the abdomen. In such cases treatment should be directed to neutralize the gases or cause their expulsion, and at the same time keep up the heart's action. For this purpose 2 to 3 fluid ozs. each of oil of turpentine and the aromatic spirits of ammonia, in 1½ pts. of raw linseed oil, should be given. If more than one dose be given it is wise to use new milk instead of the oil. Rectal injections as for spasmodic colic should also be given. It is also good practice to force the patient to take walking exercise and to apply friction to the right side of the abdomen. The acute symptoms should be followed by the administration of a saline purgative, as in cases of spasmodic colic, and as the patient already has been given oil the amount of the saline should be less than under other circumstances. In all cases of colic in the ox it is good practice to explore the rectum by hand, remove its contents and follow by injections. —J. Hugo Reed, V.S.

KILLING DOGS IN BRITAIN

It is estimated that there are between four and five million dogs in the United Kingdom and a committee has been considering the question of rationing dogs and of killing off a certain percentage. Many dogs have already been destroyed in order to save food.

Why not appoint an Official Dog Killer here. Let him appoint every other man in Canada a deputy, and let us all get busy.

POULTRY.

CULLING THE LAYING STOCK

The ordinary laying flock is made up at this season of yearling and older hens in about equal numbers. The older hens are mostly two-year-olds, though often there are a few hens three, four, or more years old which have been kept because they are favorites with the owner or he was in error about their age. The usual reason for keeping a hen after her second year is that she is known or supposed t ohave been an extra good layer. In the case of hens of small breeds, which do not tend to fatten easily after they have passed their prime, those considered likely layers may be kept for trial in a third laying season. But in the medium and large breeds the end of the second laying season should be the limit of age in the selection for future egg production. While occasionally a hen of this class is a profitable layer for three, four, or in extreme cases five years, the proportion that are profitable layers after their second laying season is so small that it is not good policy to reserve any after that age unless they are known to be exceptionally good breeders and are kept for that purpose.

All hens over the age limit having been discarded, the problem is to select from the remainder those that may reasonably be expected to produce well for the remainder of this year and through quite a long period after molting. The points to be considered in judging hens for this purpose are:

(1) How well they have laid.
(2) Whether they are laying.
(3) Their general physical condition and its relation to future egg production.

The owner of a small flock, who knows the hens individually and watches them closely, will usually know from daily observation that certain hens are yood layers. It is entirely possible to know all the good layers in a small flock in this way. But as hens are usually kept, only the few good layers that are conspicuous for some other character are known as good layers. To identify the rest some principle of selection based upon appearance or structure must be used. There are several such principles, each of which independently is serviceable for the purpose, though not infallible. If judgments of a hen by these different principles agree as to her probable performance as a layer, their common verdict may be taken as in all probability correct. When they disagree the case becomes doubtful and the relative values of the several conclusions on the different points must be weighed according to circumstances which might affect them.

A hen that at this season has smooth bright plumage and shanks and beak of a deep yellow, or a rosy flesh color, fresh looking black or slate—as the case may be—there certifies that she has not been a profitable layer. Good condition at all these points shows that she has not laid enough to drain her system of the elements that give high color to the skin and a fine surface to the feathers.

A good layer that has been kept on moist grassy land or that has recently done duty hatching and rearing chicks may have the shanks fresh looking, but will have rough plumage. If she has not yet molted her plumage will be very rough. If she has molted early, as some hens do when running with chicks, her feathers though new will still be sort and rough. Such a hen is likely to lay well through the fall and molt at the beginning of winter. It will pay to keep her as long as she laye, but the tendency to premature molt is not a desirable character and she should not be kept longer.

In the farm flock having good range there is usually no difficulty about distinguishing the poor layers by their good looks at this season. When hens have been kept on very dry land or in barn yards the plumage may be rough and dull and the shanks bleaced in the poor layers as wel as in the good ones if not to the same extent, at least as much that judgment on these poits is made more doubtful. The condition and appearance of the comb are of some assistance in that case.

The comb of a healthy laying hen is much larger when she is laying than when she is not. It is bright red in color, suffused with blood, yet soft and flexible. The poor layer that under favorable conditions has nice plumage and skin, usually has comb and wattles of a rther darker red, looking more as if the blood were somewhat congested in them. This is not so characteristic or so marked that muc himportance should be attached to a judgment based on the appearance of the comb alone.

A hen that is very fat at this season is a poor layer without question. One that is very thin and poor now may have laid well through the winter and spring, but unless the poultry keepe is conscious that shortage of feed is to blame for her poor condition, it is safe to conclude that her best laying days are over.

The best way to deal with such hens is to feed them heavily to fit for market. Manay of them will begin to lay when they regain flesh and lay well for a few weeks or months. They should be kept as long as they lay, feeding well all the time, but sold or killed as soon as they stop laying again. They are not the kind to keep over.

The width between the pelvic bones —when considered in connection with other points of structure and condition —is a fairly reliable index of marked differences in the laying capacity of fowls. Good width in this region is generally associated with sufficient breadth and depth of body to give the "double wedge shape," which is often called "the laying type."

To be a good layer a hen must have body capacity for vigorous vital and digestive organs and also for a considerable number of eggs in process of formation. A little careful observation will enable one to judge marked differences in laying capacity, as these affect or are affected by structure of the body quite as well by the form of the bird as apparent to the eye as by actual measurement of the width of the pelvis. The latter, however, is of greater service in determining whether a hen is laying at the time of handling for in the same hen the width is greater when she is laying than when she is not. This is a natural difference, the body being more distended when carrying eggs and the bones of the pelvis separating more when a hen is in that condition to give easy passage when the eggs are extruded.

A poultry keeper who, following the instruction and sugestions given, has culled the poor and unpromising layers from the flock, can get a much better idea of the characteristics of good layers and of their apearances at this season from the hens that remain than from any verbal description or pictorial illustration.

The flock now consists of about half the original number. The hens are all rather shabby in plumage with bleached shanks. They have bright, healthy-looking combs and watties, and bright, clear eyes. They are alert and energetic—out early in the morning foraging and resting in the shade by turns through the long hot summer days, and making the most of the long evenings, rarely going to roost while they can see to eat.

A flock of growing pullets nearly always contains a considerable proportion of birds that are very much under size or in other ways poorly developed. Most poultry keepers are inclined to keep these until the flock is culled at maturity. It is much better to cull them out as soon as they are marked as conspicuously backward. This is the best policy at anay time. In war time, with feed scarce, press of other more important work is the only excuse for letting them remain. They will never make a profit and the sooner they are eaten the less will be the loss on their account. Even where foraging is good it does not pay to keep them. It is much better to let the good thrifty pullets have all the feed.

MOULTING PERIOD A CRITICAL TIME.—PROPER FEEDING HASTENS IT

At this season of the year many of the hens are shedding their feathers, preparory to putting on a new coat for cold weather. Any hen which is not considerably advanced in the process of moulting by the early part of September is more desirable as material for fricassee than is an egg producer during the winter. Early moulting is essential, in fact, it is of prime importance with winter layers. No hen can be expected to lay to any extent unt. she has put on the full coat of feathers. For this reason, we find that eggs are usually scarcer and higher in price with the coming of fall than even during the hot and trying months of summer.

Save Early Moulters for Breedinig

The entire moulting process requires about three months to complete. It should not be prolonged beyond October, or mid-November at the latest. Hens which have had the best of care and possess the right inherent qualities may have about completed the work in September. One will do well to pick out those that moult early and save them for breeders next year. It is not at all certain however, that this quality is an inherited one. The hen may have been delayed in her moulting, which has lowered her vitality. But, however this may be, it is certain that she is not a desirable breeder.

Proper Feeding Important

The moulting process may be materially hastened by proper feed. Bird feathers are composed largely of nitrogeous material and mineral matter.

PEERLESS PERFECTION
The Fence For Real Protection
gives life time service. Is made of the best Open Hearth steel fence wire and impurities burned out, all the strength and toughness left in. Makes the fence elastic and springy. Will not sag or break under sudden stress or severe atmospheric changes. Galvanized to prevent rust and the coating will not flake, peel or chip off. Can be erected over the most hilly and uneven ground, without hacking, shearing or breaking. Every joint is locked together with the well known "Peerless Lock." The heavy stay wires we use prevent sagging and require only about half as many posts as other fences.
Send for catalog. It also describes our farm gates, poultry fencing and ornamental fencing. Agents nearly everywhere. Agents wanted in unassigned territory.

Thus, it is obvious that food in which these elements predominate, should be fed. Corn and wheat furnish more carbon (an element which tends to fat), than nitrogen. It is evident, then that green feed should be given in generous quantities. A broad range, where fresh green grass is abndant, is desirable. If the range also supplies bugs, grassmoppers and other insects plentifully it will help the hens wonderfully in getting their new coats. If the birds appear in poor condition and the feather-shedding is delayed, feed them a small quantity of linseed or cottonseed meal and plenty of beef scrap, or better, fresh meat and green cut bone, if available. This feed will help to build up bodily vigor and at the same time furnish material for starting the new feathers. Birds which are poor and skinny will be late in commencing the moulting process.

Some hens seem to shed their feathers all at once, others do it gradually, at any rate, sheltered quarters should be provided. There are cold nights and stormy days which are trying to the almost naked bird. In fact, she may need a warmer place at this time than during the coldest weather, when she is well provided by nature to resist the cold. Colds are often developed during such periods and croup sometimes results.

Hens may continue to lay during the feather-shedding period, or even part of the time while the new feathers are growing, were they in good condition in the beginning, and are kept so.

There is always sure to be a certain period when laying is discontinued. Usually this is at least a month or six weeks in duration, even if the birds have the best of care. With poor care and neglect it may be twice that length, and with the late moulters it may last until spring. Thus it can readily be seen that the moulting period is a critical time with the fowls, and much depends upon the care-taker.

EGG EATING AND FEATHER PULLING

In the spring of the year two bad habits, egg-eating and feather-pulling, often develop in poultry flocks. There is usually one or more causes for the development of these habits although they develop sometimes without any aparent cause. They both agect profitable returns and consequently should be stamped out as quickly as possible.

Egg-eating is frequently caused by a lack of lime, in the form of oyster shells, or meat food, in the form of beef scraps, green bone and skim milk. Hens which do not get enough exercise sometimes become neavy egg-eaters. Remove the offenders from the pen. Place oyster shells and grit in hoppers or boxes, so that the birds can help themselves a tany time. Add meat food and green food, mangels, turnips or sprouted oats, to the ration, and make sure the hens take plenty of exercise. Always provide dark nests—make them so that the hens enter the nests from the rear.

Feather-pulling usually develops in flocks where there is a deficiency of meat food in the ration, or where the birds do not take sufficient exercise. Remedy the cause. Give meat food in the ration, and give the fowls all the skim milk they want. Feed the whole grains in five or six inches of litter.

GUINEA FOWLS ON EVERY FARM

Every farmer should keep a few guinea fowls, in the opinion of W. A. Lippincott, professor of poultry husbandry in the Kansas State Agricultural College. Not only do they make themselves valuable as watch birds against hawks, but, because of their wild game flavor, they are coming into favor as food.

"Formerly hotels and restaurants served brouse, quail and other wild game birdg but now, on acocunt of the enactment of game laws, they are forced to find a substitute. The guinea fowl makes an acceptable substitute and is being used increasingly because of its simlar taste."

Due to the small size of the guineo egg, the raising of guineas for egg production is not advised by Professor Lippincott. The guinea egg is classed as a second. If the demand for the wild game taste is to be satisfied, however, the production of guineas for the market should become profitable.

Especially is the guinea a source of profit when raised on the farm in small numbers, since the food that it eats in ranging over the farm is just waste feed that probably would not be utilized otherwise. The guinea fowl does not stand confinement well, but on the farm where it can have free range the conditions are nearly ideal for this bird. Guineas can be raised by use of incubators, but the method which proves most satisfactory is too use hens, or, better yet, bantams, for brood mothers. Then the wild nature of the guinea will be moderated, and the birds can be cared for more easily.

FEED BRAN TO HENS AND GET MORE EGGS

Bran is one of the best of the inexpensive poultry feeds, being especially valuable because of the large amount of lime it contains for the composition of egg shells. It is light and bulky, neither heating nor fattening, and therefore ideal for summer feeding to mature fowls. Too much grain in the summer time is liable to make the fowls overfat or clog their digestive organs.

We keep a small box or trough constantly filled with bran in the poultry house, where the fowls can partake of it at any time desired. Self-feeding hoppers are especially good to keep the bran in, if you have them; they prevent waste and contamination of the feed. There is no real danger of the fowls eating too much bran, and when it is kept before them constantly it will not interfere with the regular feeding schedule. If you do not want to feed bran in this way, however, see that the fowls get plenty of it in the mash.

Get More Winter Eggs

Now is the time to prepare for a profitable egg yield this winter. Winter eggs bring highest prices. Delay now means loss of profits.

Pratts Poultry Regulator

surely and quickly puts your hens in laying condition. Keeps them well and makes them lay, particularly in winter.

Idle hens cost money for feed, and feed is high this year. Offset the high cost of feed by giving "Pratts" with the ration. It helps the hens to convert their feed into EGGS.

At your dealer's in popular priced packages, also money-saving 25-lb. pails and 100-lb. bags.

Money Back If Not Satisfied.

THE BREEDING COCKEREL

Though it is best to separate the cockerels from the growing pullets as soon as their sex can be determined, considerable harm can be done by herding flocks of young cockerels intended for breeders by themselves away from all female birds. A better plan is to put them with a few mature hens and a cock bird or two to keep them in order. Cockerels reared in this manner are less liable to be sterile, will prove less abusive wehn first mated up with females, and will be less liable to go to pieces after a few weeks of breeding.

SENT TO SIBERIA

The Government Conscripts Cowan's Cocoa—Cheerful News for Our Men

Toronto, Oct.—A plentiful supply of Cowan's delicious and nourishing Cocoa is assured the Canadian troops that are going to Siberia. Tons of this splendid food were recently purchased by the Canadian Government, and are now en route to a certain port on the Pacific Coast.

Thus, while our soldiers engage the enemy, Cowan's Cocoa will do its share by fighting the cold and protecting our troops from the severest attacks of the Siberian Winter.

Those who remain in Canada should enlist the services of Cowan's Cocoa as a "Home Guard." See that the children are provided with all they require. It makes them robust and protects them from epidemics.

WOMEN'S INSTITUTE SECTION

This section of the Maritime Farmer will be devoted to the interests of the Women's Institutes of New Brunswick. We respectfully solicit contributions from all branches, touching upon matters of general interest. We wish the members of all branches of the Women's Institute to feel that the Maritime Farmer wishes to fully assist them. The Maritime Farmer is the official organ of the Women's Institute of New Brunswick. We would suggest that YOUR BRANCH name a press committee, so that news from YOUR BRANCH may reach other branches.

THE HON. W. F. ROBERTS ON MEDICAL INSPECTION

Interesting Address Delivered by Him Before Convention of Women's Institutes—Gave Outline of Provincial Health Organization—New Brunswick Banner Province in Health Legislation

The address by Hon. W. F. Roberts, M. D., M. P. P., of St. John upon the important subject of "Medical Inspection" delivered before the sixth annual convention of the Women's Institutes of New Brunswick is herewith given. The address was listened to with great interest by those in attendance and gave an outline of the organization of the Department of Health recently established by the Provincial Government.

Hon. Dr. Roberts spoke as follows:

Madam Presiding Officer, Ladies of The Provincial Women's Institute in Sixth Annual Convention, and friends.

Having been invited to address you upon a subject in which I am and have been for years much interested, let me assure you I deem it a signal honor and an especial privilege particularly at this time.

Permit me first to congratulate you upon being members of so practical, worthy and representative organization as I understand the Women's Institutes to be, representing as they do almost every piece of inhabited territory within the Province and carrying to its utmost recesses its valuable precepts and teachings.

Important Organization

I feel quite satisfied that, while but six years have passed since its organization, much practical and necessary work has been accomplished, among and for the people with whom the personnel of this Institution has come in contact; and if much has been done during this short period, how much more must lie in wait to be done, particularly from now until after the readjustment of the world and provincial affairs following the close of the Great War.

I am impressed with the fact that it is nothing short of Providential that such an organization as yours should have existed sufficiently long to have its Constitutional machinery working and running so smoothly, and to have become intimately acquainted with the multiple needs of Home and Empire as found within the confines of our fair province. Wtih your numerous societies, scattered as they are throughout the length and breadth of the province, you constitute one of the most important mediums for the disseminating of knowledge and information calculated for the well being of its inhabitants; and if for no other reason, I certainly feel you should have the cooperation and practical support of all well thinking people.

The subject suggested by your Committee who waited upon me, that I might speak to you upon, is "Medical Inspection of Schools and its effect upon future citizenship." This selection in itself is a further indication to me of your wishing to keep abreast of the times, because of your interest in the homes of the Province and its future welfare.

Citizenship

Before entering upon a discussion of the question itself, let us for a moment decide upon an interpretation of the word "Citizenship" which will serve to ring before our minds in a practical way the application of our topic.

We may speak of this term "citizenship" in both a general and a particular sense. First in a general sense with the qualifications of ones domicile either by birth or by settlement and that of a legal age. Then in a particular sense, such as the qualifications necessary to become or be denominated a good citizen, as we so frequently read and hear spoken of an "ideal citizen." These qualifications in addition to birth and age, might be enumerated as being: Law abiding, Loyal, Intelligent, Industrious, Moral, Thrifty, and one which we have heretofore been so inclined to forget and which after all in the laying of the foundation of the superstructure of "Future Citizenship" is the all important pillar,—viz. HEALTH. In fact, in the erection of a successful career, Health and Education are common corner stones, for the man is crippled physically without the one, and mentally when not in possession of the other. How handicapped must be the various callings in life, and how much more could be accomplished by their followers if the amazing fact did not obtain that from 50 to 60 per cent of our men when placed in line for physical examination for Military service, are unable to occupy the "A" class position, in other words are physically incapacitated to that extent. This means more than appears on the surface. It means that many of these deficiencies have advanced so far that but little if anything can be done to restore, and further renders the subject the more susceptible to further ills, and in the majority of instances shortens his days.

Health an Asset

In the one case Health is one of the requirements of Citizenship, is an asset to the Province, to the Dominion, to the Empire; in the other, where it is wanting, that fact is in the majority of cases a liability. If you doubt it visit our hospitals, our tubercular sanitariums, our incurable homes, our municipal homes, our asylums, and (had we one as I hope we may) our home for defective children. Place in a column the figures representing the cost of maintenance of any one, or all of these, and I will place before you a solution of the problem where thousands upon thousands of dollars can be saved, to say nothing of the saving of depleted populations, pain, suffering, and anguish, by the practical application of a Public Health Policy.

Now having defined "Citizenship", and by the way drifted a little,—where do we begin to study the Public Health problems? Where do we begin to study the Educational problem? Why with the children, of course; then so with the topic in hand. Let us continue our attention now to "Medical Inspection of Schools" and before we have finished we will have seen its relationship to "Future Citizenship."

Some one has said, relative to Good Citizenship as the basis of our future liberty, "Whatever ideals it is desirable for the citizens of tomorrow to possess must be instilled into the consciousness of the children of today." If this is true regarding matters pertaining to ideals of mind, they are equally applicable to matters pertaining to physical freedom from incapacitation.

Science of Disease

It was Plato who over 2,000 years ago wrote "Medicine is the Science of Health." Today however, it is properly regarded as the "Science of Disease" and as the authority for the above statement goes on to say, had the truth of Plato's dictum been recognized some Government department of preventive medicine would long ago have been established and we should be in the habit of paying for medical attendance only while we were actually maintained in good health.

The truth of the principle that "prevention is better than cure" is appreciated only in the face of actual and imminent danger such as the outbreak o fcholera or smallpox. In such an emergency nothing is left undone, no expedient is lelt untried. The preventive measures adopted may even savor of extravagance. But the crisis weathered, our enthusiasm soon begins to wane and eventually is at a standstill until some further dread malady is on its way or springs up in our midst.

Public opinion must first be impressed by solid argument based on substantial facts and common sense, then progress is ours. Here consequently is found one reason why public opinion and even in some instances, the medical profession heretofore has withheld judgment upon the necessity for the medical inspection of schools. Had the importance of preventive measures been more thoroughly realized there would have been less delay both in the recognition of the necessity for, and in the institution of medical inspection.

Why the most superficial physical examination at school undoubtedly tends to prevent much actual ill health, owing to the resultant discovery of disease in the early stages, as well as of many simple ailments which might ultimately become serious.

Physical Examination

In speaking of the History of Medical inspection we find as far back as the schools of Hellas at least the aspect of school hygiene, viz., physical examination was recognized as a means of developing the ideal citizen of which we have already spoken. The training of the body was regarded as of equal importance with the training of the mind. But in the Greek world physical education was a reality world physical education was a reality. It did not consist of a systematized code of physical exercises, nor of a course of physical training imposed at set times. It was a natural education of a child's body, directed partly to securing healthy growth and development of good physique, and partly to creating a favorable reaction upon the child's mental and moral activities. As quoted from an article upon this sugject,—"Man was a whole to the Grecians of that day, and one part of him could not be sound if the other parts were not." A national school which trained the minds only and neglected the bodies of the pupils would have been inconceivable to the Grecians of that day.

This was long ago. Suffice it to say that here and there thoughout the world spasmodic efforts have been put forward in the interests of the health of the child at school; but it was not until the last century that anything of a durable or lasting character was accomplished.

We find that apart from physical training Dr. Karl Lorinser was the first medical man to make a thorough study of school hygiene. In 1836 he published a pamphlet in which he attacked the educational system and pointed out that the then long school hours, the subjects taught, and the school management generally, were largely responsible for deterioration of the children's health. This created a great stir in Germany and led to the general admission that school hygiene was a subject for special and thorough study. In 1842 Dr. Seguin published a book re the condition of the feeble minded, which marked a great educational advance in the field of school hygiene. It is the first practical differentiation of educational methods for feeble minded children, and it was soon followed even in England by the

This greasy imitation is the poorest one we have yet seen of the many that every Tom, Dick and Harry has tried to introduce.
Ask for MINARD'S and you will get it.

establishment of a number of institutions fo. rthe education of such children.

In England

In England for the most part these matters were neglected. Children coming from well to do homes were not at that time considered to be in need of health inspection. The only provision was arrangements to make clean the child who came to school dirty. But the Education Act of 1870 changed all of this, bringing as it did every child under the direct attention of the State Educational Laws. But it was 20 years after the institution of compulsory attendance before any medical advice was thought necessary in this particular. During this intervening time, however, many observations were made by men both in England and on this continent, which in some instances formulated the basis of further enquiry. Cohn of Breslau was the first. He was an army surgeon during the Prussian war of 1866, and had observed defective vision among the soldiers, and a little later on published his famous report upon the eyesight of some 10,000 school children. His investigations gave rise to much speculation and as a result medical inspection of schools was advocated by Virchow and discussed in that year at the Scientific Congress. Later Cohn himself drew up a scheme of duties for school physicians which was first considered at the International Congress of Hygiene at Geneva in 1883.

Other Efforts

In 1875 Prof. Bowditch recorded the measurements of height and weight of 25,000 school children in Boston. In 1881 Hertel of Copenhagen began an extensive inquiry into the conditions of school life. One year later, as a member of the Danish Commission, he reported that of 16,000 children examined in both primary and secondary schools, 29 per cent. were unhealthy. In 1884 a Royal Swedish Commission was appointed to investigate health conditions in school, and on their behalf Prof. Axel Key examined 18,000 children in several countries and published a report upon the growth and development of boys and girls at different age periods. The result of this investigation was that he found over 35 per cent of children suffering from chronic physical defects, such as an aemia, headache and short sight.

Dr. Francis Warner of England in 1885 first directed his attention to the examination of school children, with especial reference to their mental status. His pioneer work led to the appointment in 1888 of a Committee of the British Medical Association for the Scientific study of the mental and physical conditions of child life. In 1892 Warner published a full report of the examination of 100,000 school children in some 20 schools. The result of his investigations was to arouse general interest in the whole subject of educational hygiene, and as a result mental deficiency was officially recognized by the appointment of a Royal commission on the Blind, Dumb and Feeble-Minded; and while at this work Dr. Warner drew public attention to many conditions adversely affecting the health of the school child. In fact he laid the foundation of the science of child study and stimulated the interest of many medical men in the large field of school hygiene. In England at this time the authorities were slow to take hold of the matter, while during this period in Germany there was a popular agitation for systematic medical inspection of schools, and had become universal throughout that country.

First Official Step

The first official step in England was the appointment of medical officers to act as advisors on general medical matters in connection with the Elementary education, and especially for the examniation of children suffering from disease necessitating absence from school. No statutory provision for these appointments or for conduct of any medical inspection existed, but progressive school boards, taking a wide view of their general powers, appointed medical advisors as necessary officers under the general powers conferred by certain sections of the Elementary Education Act of 1870.

Then in 1891 a medical officer was appointed by the school board of London, and two years later Dr. James Kerr was appointed at Bradford, ostensibly for the purpose of examining absentees from school who were alleged to be suffering from disease, but who did not furnish a Doctor's certificate and from this small beginning many other duties were required of him and finally Dr. Kerr was recognized as the pioneer of all official routine in connection with medical inspection in the Elementary school of England. He was the first man to enter the schools daily in the role of a school doctor and to study all the problems of school hygiene.

In 1904 we read where Dr. Leslie McKenzie writing states, in England the system has so far spread that already there is a society of medical officers for schools. The larger school boards provide for medical attendance on their teachers and pupil teachers, for the regular visiting of their school for the dove-tailing of medical school inspection with the regular work of the public health organizations, and generally for the discovery of infection among school children, and the prevention of infection by detailed periodic examinations of school premises.

Other countries taking on medical inspection of schools have been Austria Hungary, 1873; in France in 1886 and thoroughly re-organized 1896; Argentine in 1888; Norway began in 1885 and was completed and made obligatory in 1891. Sweden began as far back in 1868, and have been reorganizing and placing on a more up to date basis, 1895-1899. Japan, school doctors appointed for every school in 1898.

Switzerland, 1898 passed legislation insisting on a thorough medical examination of every pupil before entering school for the first time. Germany in 1891, although certain districts were under inspection as far back as 1870.

In U. S. A. separate states are taking up this important question. Some 10 or 12 states already have made same compulsory. Even in Russia, Bulgaria and Roumania quite well organized systems of school inspection have been obtained from 1871 to 1904 respectively. So much for the History of Medical Inspection.

In Canada

In Canada, Ontario was practically the first province to adopt medical inspection. It was first carried out in Toronto and now the remotest portion of the province is under this legislation. Later the Western provinces have fallen into line, and nearly every province, has either separately or in association with the Educational Department, some form of Medical Inspection.

Banner Province

New Brunswick, I might humbly suggest, is the banner province of the Dominion in having an Act calling for a Department of Health, represented upon the Executive the same as the other departments; in other words, placing the question of the health of the people in the foreground where it naturally belongs. This means that medical inspection will be controlled by the state in this Province and the argument for the support of this rests upon the fact,—and it cannot be denied,—that there are present in the schools (town and country alike) children suffering from preventable and remediable diseases, of which both the teachers and the parents are ignorant; besides others suffering from diseases the serious nature and consequences of which no one but medical men can recognize. This assertion scarcely needs the support of figures and statistics, but in passing let us recall the fact that more than 80 per cent of the children are suffering from defective teeth, and 50 per cent are affected with vermin or othr parasitic conditions; 20 per cent with defective vision, and that 10 per cent are retarded in their educational progress by physical defects such as anaemia, general debility and deafness, resulting from adenoidal growths or discharging ears. These figures may not be exact, but the general inference is sufficiently sound and inasmuch as the greater National asset is Men and not Money, it behooves the state to be up and doing, particularly at this, the most unique time in the history of the world regarding the question of the conservation of health and life.

Must Have It

Then a further argument to my mind is that if we have the law of compulsory education, we must of necessity have that of medical inspection. It is hardly fair to insist upon attendance at schools on the part of the child, and at the same time fail to make the environment of such safe for the child to remain in.

Systematic medical inspection benefits the province from an educational standpoint inasmuch as one of the principal pillars supporting education is Efficiency; and one of the important ways in which this can successfully be brought about is quite obvious. The higher the percentage of attendance the more chance there is that the education given will prove beneficial to a greater number of children, so that efficiency indirectly depends upon attendance and most measures that increase attendance make for increased efficiency in education.

Quoting from a portion of an article from D. Cody the New Minister of

Troubled With Kidneys For Over Three Years.

WAS CONFINED TO BED.

Mrs. George Gray, Hopewell Hill, N.B., writes:—"I had kidney trouble for over three years, and was so bad I was confined to my bed. First I contracted a bad cold and it went to my kidneys, and I suffered dreadfully. I got the doctor, but he did me very little good. I tried all kinds of kidney pills, but got very little help. One of my neighbors came in to see me and told me to get Doan's Kidney Pills and give them a good trial. I used five boxes and they have cured me so that I can sleep all night without being disturbed, and I feel better in every way. I cannot say too much in favor of Doan's Kidney Pills."

Doan's Kidney Pills are just what their name implies; a pill for the kidneys and the kidneys only. When you ask for "Doan's" see that you get them put up in an oblong grey box with our trade mark "The Maple Leaf". Price 50c. at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.
Address
MRS. M. SUMMERS, Box 309
Windsor, Ont.

Education of Ontario, we find him saying that "It will be the business of the oncoming generation to reconstruct the world. Immediate measures will be taken by those who are in active life but for the full expression and character of the new world after the war, we must wait for the efforts of the young and hopeful who, spared the actual horrors through which the present generation has passed, shall take off its coat and reshape the world to the heart's desire. One child therefore becomes all important in the scheme of things. The application of eugenics would guarantee him proper birth,—but if that scheme cannot be statutorily employed, every possible assuagement of existing conditions should be offered. The business of the child now newly born is no less onerous than to remake this planet, and therefore every amelioration should be applied to produce fitness for the task imposed by the circumstances of the war.

Training for Motherhood.

The girl should be trained for motherhood. Motherhood itself should receive a fresh consecration in the general heart and mind and every creature, male and female, who encourage or condone race suicide, should repent in sackcloth and ashes."

Also another quotation from an address delivered by Dr. Cody at Agricultural College in Guelph, as follows: "There is a real need throughout our rural schools particularly for medical and dental xeaminations. I don't think it will ever do to let this rest as merely an optional matter. We are not conserving our children if we do not also try to conserve them in body. I feel that this matter must be taken up and dealt with right speedily. The Women's Institutes are doing excellent work in some parts of the Province in carrying out medical inspection, but at the best it is only spasmodic. The system when introduced in this province must be compulsory and universal.

In conclusion there are many features of this work that time will not permit on this occáson to consider. We have had the History, the arguments for the same illustrations as to the findings of a systematic medical inspection, which by the way is argument enough in itself for the bringing into life such legislation and then applying same.

Provincial Organization

Now as to methods. It is our plan to have a Public Health Bureau, made up of Chief Health Officer, Chief Medical Officer, Chief of Laboratories, and a District Helath Officer for each district. There will be three districts.

Eastern:—Comprising Restigouche, Gloucester, oNrthumberland, Kent and Westmorland.

Southern:—Albert, Queens Kings St. John City and county.

Western—Charlotte, Sunbury, York, Carleton, Victoria and Madawasko.

Each district will be subdivided into sub-districts and each county will constitute a sub-district. The sub-districts will be divided into parishes, each parish will have a medical school inspector who will examine the school at the beginning of each term and be on call from the teacher regarding any special condition that shall arise.

The teachers will receive a certain number of lectures at Normal School re recognition of communicable diseases, so as to be able to request the withdrawal from school of any pupil, who will be required to produce a certificate of family physician that they are eligible physically to return.

The district health officer will have charge of the medical inspection in his own district, and each medical inspector who is an appointee of the sub-district board of health must receive the approval of the Chief Medical Officer before contract is closed. The above refers to rural schools. To city, town and consolidated schools the medical inspector in some instances will be an all time official, in other instances will visit the schools as often as it is thought necessary.

The premises of school buildings are inspected by any medical inspector and district health officer, and recommendations for their betterment from the trustees to act upon, and will be kindly compulsory.

The system of school inspection is good, but rendered much more effcetive by a school nurse whose duty it will be in cities and towns at least to visit the school with the inspector and then to follow up the work a the home of the child to see that such is being attended to.

I have in mind some service of a similar nature for rural districts, but it will take some little time to develop same.

I fear I have already wearied you, but there is so much to be said, it is difficult to know when to stop writing. It is needless at this stage to direct your attention to the fact that the effect of medical inspection on future citizenship will be the robbing of our hospitals, asylums, sanitoriums, etc. of their patients and handing them over as practically healthy units to the state as an all-round asset, and all that that means to the home and the various callings in life.

CHILDREN AT THE TABLE

What a pleasure it is to sit down to a meal at a nicely aranged table, where the children eat without remarking on the food that is placed before them, and the good lady of the house, even though she may look a trifle hot after getting everything ready, seats herself also, and evryone enjoys the perhaps plain, but well-cooked meal. It is a pleasure to be in a home where the older people are allowed to carry on the conversation without any un-

Save Sugar!

Don't use Sugar where Corn Syrup will serve your purpose as well or better. The ships that carry sugar are needed for soldiers and their supplies. Crown Brand and Lily White Corn Syrup are delicious, wholesome and economical alternatives for sugar in pies, puddings and preserves; as a sweet sauce and on cereals.

Use **CROWN BRAND CORN SYRUP**

The most nutritious part of the corn converted into its "sugar" or syrup form, with the added flavor of a little cane syrup.

LILY WHITE CORN SYRUP

For use where the Food Board Bulletin calls for Corn Syrup (White)
Delicious for table use and cooking.

In 2, 5, 10 and 20 lb. tins, at all dealers

CANADA STARCH CO. LIMITED - MONTREAL

Could Not Work

ON ACCOUNT OF

SEVERE HEADACHES.

Headaches are generally caused by some disturbance of the stomach, liver or bowels, and although not a serious complaint, the cause should be removed before they become habitual and make your life miserable.

You will find that Milburn's Laxa-Liver Pills will remove the cause by moving the bowels gently, safely and surely, refreshing and strengthening the stomach, toning up the liver, and thereby banishing the headaches.

Mrs. J. Armstrong, 7 Harris St., St. John, N.B., writes:—"I take pleasure in writing you concerning the good I have received from using Milburn's Laxa-Liver Pills. I had such severe headaches I could not do my work, but after using two vials of your pills, I can now do my work with comfort and pleasure."

Milburn's Laxa-Liver Pills contain purely vegetable matter and do not gripe like harsh mineral purgatives do. Price 25c. a vial at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

WIN

This Real—Gasoline Auto

for Boys *and* Girls

$150.00 *in* other Prizes

FIRST PRIZE

Real 5 horse power auto with high class air cooled 4 cylinder gasoline motor, just big enough for any boy or girl. Runs like real autos. Has artillery wheels, solid rubber tires, steering gear and wheels, 2 brakes, tool box, tools, cone clutch. Any boy or girl can run it easily. A real prize for boys and girls.

SOLVE THIS PUZZLE

23	8	5	14	-	7	5	18
13	1	14	25	-	9	19	-
4	5	6	5	1	20	5	4
-	1	14	4	-	14	15	20
-	1	-	13	9	14	21	20
5	-	2	5	6	15	18	5

WHEN WILL THE WAR BE OVER?

CAN you answer this question—When will the war be over? Every boy and girl wants to know. You can, if you are able to read this puzzle. The answer is contained within the 48 squares above. What is this answer? Solve it, and valuable prizes await you.

HOW TO SOLVE IT

The above squares hold the answer. It is in one sentence of nine words, containing forty letters. Each letter is represented by a number, and that number is the position of the letters in the alphabet. For instance, A is represented by the figure 1, as it is first in the alphabet, and so on. Now, to help you get started, we will tell you that the first letter in the puzzle is "W," because W is the 23rd letter in the alphabet. Get to work and figure out the words in the sentence, and try to find the answer to the great question, "When will the war be over?" It is not easy, but it is worth while trying for.

THE PRIZES

PRIZE	VALUE
1st—Five Horse Power Auto -	$150.00
2nd—Dandy Folding Camera -	25.00
3rd—Magnificent Gold Watch and Chain, or Girl's Wrist Watch - -	15.00
4th—Lovely 36-inch Doll, hand-gowned, and beautiful English Doll Carriage -	10.00
5th—Electric Projectoscope. Better than a magic lantern. Will show any picture or post-card photo on screen -	7.50
6th—Full-size Football - -	5.00
7th to 10th—Self-Filler Fountain Pens, each $2.50, - -	10.00
Also 10 Extra Prizes for Boys and Girls, each $1.25, - -	12.50
Total Value of Prizes - -	$235.00

Copy your answer upon a plain white sheet of paper as neatly as you can, because neatness spelling, hand writing, and punctuation count if more than one answer is correct. Put your name and address in the top right hand corner of the paper. If you have to write a letter, or show anything else, put it upon a separate sheet of paper. We will write and tell you your answer is received, and tell you if your solution is correct, and also send you a complete illustrated list of the grand prizes that you can win.

What Others Have Done, You Can Do

Here are the names of only a few of the boys and girls to whom we have recently awarded prizes—

Shetland Pony and Cart, Helen Smith, Dimention.

Shetland Pony, Beatrice Hughes, Hazenmore Sask.

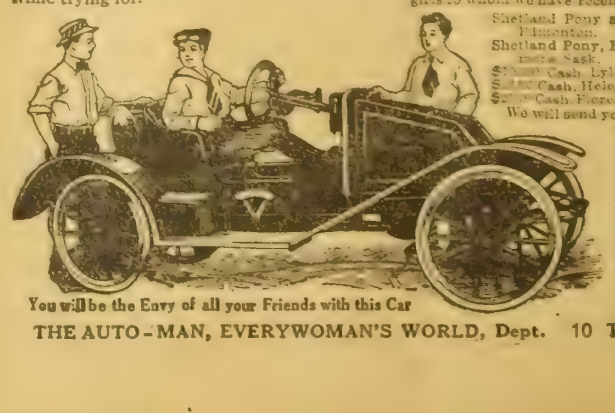
$[illegible] Cash, Lyle Benson, Hamilton, Ont.

$[illegible] Cash, Helen [illegible], [illegible], Alta.

$[illegible] Cash, Florence Nesbitt, Atherton, Ont.

We will send you names of many others too. Only boys and girls under 17 years of age may send answers and each boy or girl will be required to perform a small service for us for which an additional valuable reward or special cash prize will be given. The contest will close on March 31st at 5:00 p.m.

Send your answer this very evening. Address



You will be the Envy of all your Friends with this Car

DODD'S KIDNEY PILLS CURED HIS CHRONIC SORE BACK

M. J. Morrison Had Suffered for Thirty-Ive Years, But Got Prompt and Permanent Relief.

Tarbot Vale, Victoria Co., N.S.—Nov. 2nd, (Special.)—Those who have not used Dodd's Kidney Pills, and who would like to enquire as to their value as a kidney remedy, can get valuable information from Mr. M. J. Morrison, the postmaster here.

"I had been suffering from sore back for over thirty-five years, but after taking the first box of Dodd's Kidney Pills I have never had a moment's pain in my back," he says.

"Dodd's Kidney Pills are an invaluable remedy for sore back, especially if the kidneys are affected."

It is because his kidneys were affected that the postmaster got such prompt and permanent relief by using Dodd's Kidney Pills. They are a kidney remedy. Acting directly on the kidneys, they put those important organs in condition to do their full work of straining all the impurities, all the seeds of disease out of the blood.

It is because of thus removing the cause of disease that they have given such splendid results in treating rheumatism, dropsy, heart disease, gravel, diabetes and Bright's disease. Ask your neighbors about Dodd's Kidney Pills.

---

timely interruptions from the children seated at the table. And yet how many times have you had a meal at a table packed full of dishes, table cloth none too clean, food splashed on to the plates, children untidy, lady of the house hot, untidy and generally cross. And there you sit trying to shout in a word now anad again to your hostess while she is trying to listen to you and, at the same time keep the children quiet and see that everyone is getting enough to eat. She is generally the kind that criticizes her own cooking saying that this is not just what it should be, that the biscuits are a little heavy, the potatoes aren't quite salty enough, and the hundred and one other little things that help to make the children dissatisfied with what is set before them. Remarks sould never be passed on the food in front of children, and if people would remember this, children would perhaps, never think of "not liking" that or "liking" something else. They would take it for granted that what "mother" makes must be good, and eat it without question.

With few exceptions, children may be taught proper food habits. Children know nothing of foods in the beginning save those which are set before them and have to learn to eat every article of food. If from the first wholesome and suitable foods are served without comment or question, most children will like them, and thus normal dietary habits will be established.

In some cases a child may exhibit a distaste for certain food—such as eggs, for example, which he may not be able to eat but in general he or she can be and should be taught to eat all wholesome foods. A child who insists that he does no like this or that food may not be perfectly well, or his appetite may have been perverted by one cause or another. Others may have had their tastes limited by the objection of the members of the family to certain articles which are consequently limited by the objection of the members of the family to certain articles which are consequently almost excluded from the table. It is also quite possible that a certain child's distaste for certain foods may result from poor cooking, scorching, over-seasoning or other faults of preparation. For example, most children have a wholesome natural objection to pepper and sharp condiments, and will not eat foods in which they are used. It may be sufficient to destroy their relish for such things as soups, vegetables and meats. On the other hand, food may be so negative that it excites no pleasure in eating. It is important to have the ordinary foods appear on the family table so seasoned and flavored as to make them attractive, palatable and capable of exciting a copious flow of the various digestive juices. Flavorless, badly cooked, unattractive, and unappetizing food will be poorly digested. The pleasing appearance of food and an agreeable manner of serving it have much to do with the pleasure of eating it.

After the third year three good meals a day will usually suffice. The habit of lunching or nibbling on candy or cake between meals tends to destroy the natural appetite and to make a child indifferent to his regular meals, and leads to indigestion and malnutrition. If the interval between dinner and supper is very long, a light lunch consisting of milk, or bread and butter, ripe fruit, or other light food may be given halfway between these meals.

Meats should be cut fine, vegetables mased or strained, anad seeds and skin removed from fruits for the youngest children.

From the first the child must be taught to chew his food thoroughly, and must be continually watched to see that he does not fall into the habit of eating too fast and swallowing large mouthfuls without sufficient mastication. To guard against this habit, pleasant conversation and laughter should be encouraged at the family table, anda children should learn from the example of their elders to make the mealtime a happy one.

If a child will not eat he sould not be urged to do so, nor should he be tempted with indigestible or unsuitable foods when he refuses the ordinary articles. The lack of appetite may be due to many cauases, but a child in health should be able to eat simple, well-cooked food of pleasant variety at the three regular meals of the day. Morked or long continued lack of appetite, or freakish desires—as, for example, the longing for vinegar or sour fruit—may indicate illness, and such a child, instead of being scolded or nagged, which alone is sufficient to spoil the appetite, should be examined by a physician. Poor teeth or lack o fteeth may cause enough pain to the child to diminish his appetite. Constipation or any form of illness may have the same effect.

fI there is some wholesome article of food which the child persistently refuses and which seems essential to his well being a small portion of this food perhaps in a new disguise may be given first at the meal and other desired articles withheld until the child has eaten some of it. But taste and appetite are more successfully cultivated when they are noticed least, and the very effort to make a child eat something he does not fancy may serve to establish an even greater distaste.

CURED HIS RUPTURE

I was badly ruptured while lifting a trunk several years ago. Doctors said my only hope of cure was an operation. Trusses did me no good. Finally I got hold of something that quickly and completely cured me. Years have passed and the rupture has never returned, although I am doing hard work as a carpenter. There was no operation, no lost time, no trouble. I have nothing to sell, but will give full information about how you may find a complete cure without operation, if you write to me, Eugene M. Pullen, Carpenter, 5543 Marcellus Avenue, Manasquan, N. J. Better cut out this notice and show it to any others who are ruptured—you may save a life or at least stop the misery of rupture and the worry and danger of an operation.

THE PEAR TREE

"Why, Ellen Riley!" exclaimed Mrs. Walling. "I didn't know you was as wasteful as all this! Look at all those pears lying on the ground! Why in the world don't you pick them up?"

"Because they aren't mine," Ellen answered. "They belong to Amelia Stedman over the fence there. All is, the limb hangs over and the pears fall on my side."

"Well," said Mrs. Walling, "it's your fruit then. The law gives it to you. Ask Tom Cheney and see. If I were you I wouldn't hesitate to use them. You haven't any pears. And these look nice." She stooped and picked up two or three.

Ellen caught her arm. "Put them back on the ground quick!" said Ellen. "She's there behind the curtain watching, and I wouldn't have her think I touched one of those pears for the world."

"Pshaw!" Mrs. Walling deliberately set her teeth in the fruit. "I ain't one mite afraid of Amelia Stedman, and I'll tell her so to her face." She studied the situation a moment. "How does she get the pears on this side of the fence. Does she come over into your yard after 'em?"

"Yes. You see that place where the pickets are off? She comes through there. I don't mind."

"Well, I should mind," said Mrs. Walling emphatically. "I wouldn't have her on my premises. I'd tell her so, or put up a sign. I guess you haven't got any spunk, Ellen."

"Maybe I haven't" signed Ellen. "But I always liked Amelia. We were young together and you know you feel sort of tender toward people you've always known. She is a good woman at heart. The trouble is she lived so long with old Jake Stedman that she has grown to be a little like him."

"Maybe you're right, Ellen," Mrs. Walling said. "Well, since you won't have the pears I picked up I'll take 'em home with me."

Ellen stood a moment looking after the other woman as she moved down the street. Then she cast a look at the pears lying upon her grass. It would be so easy to help herself to some of those pears and vindicate herself by declaring that the law was on her side. She was poor and every scrap of food counted. She had little to eat that was appetizing, and Amelia had so much. By her husband's death a few months before she had been made the possessor of more than most women of her class. The money would never do her or any one else any good, so selfish was she. No one liked Amelia Stedman, while Ellen was a general favorite.

Ellen was a slender little woman, with gray hair, agate-like brown eyes, and a sweet mouth. Life had not provided her with many sweets. But she had made the most of what she had and been content with it. She lived alone in her own house, and no one knew how poor she was, because she never told. When she could get plain sewing to do she fared a little better.

She went into the house and prepared her usual supper of toast and tea. After she had eaten she put everything in the nicest order and sat down to her tatting. She was making a collar for Lottie Cheney, the justice's daughter, who was soon to be married. Ellen put a great deal of love as well as pains into that collar, for she had known Lottie's father and mother in their young days. In fact, if it had not been for Lottie's mother Ellen might have married Tom Cheney. As it was Ellen had been crowded out of happiness. Tom had been a widower now for more than a year, but Ellen felt she was too old for romance. And it was said of Tom that his devotion to his wife was such that he would not marry again.

The room grew dim and Ellen rose to light her lamp and close the door when she heard a strange sound. She ran out on the porch to listen and look, but she could see nothing.

"Did you hear that, Ellen?" called a woman's voice. It was Mrs. Hunt from across the street. "I've been out here listening to it for some time."

"It's a wild goose, isn't it?" Ellen asked.

"Yes, and you hardly ever hear them so close to town. If they fly over they fly high. This one is right down over us. There! It means theres a storm of some kind coming."

Ellen went into the house. She could still hear the wild cries of the fowl, though they were growing fainter and fainter. She wondered to what haven they were hieing. Then her work absorbed her, and she began to think of Lottie Cheney and Tom and Amelia Stedman and old Jake, with his yellow skin and one black eye, who had by his stronger personality warped and disfigured Amelia's nature. "At least I have only myself to answer for," she thought. Presently she fell into a pleasant sleep.

She woke in a flutter. All around her was one great engulfing tumble of thunder. "My goodness!" she said aloud. "Mr.s Hunt was right. Those birds knew. And my bedroom window is wide open."

As she approached the open window a great flash of lightning seemed to jump to meet her. But she said to her-

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Address

THE LAW OF HEALTH

PURE BLOOD

The Kidneys are the great filters of the blood. If for any reason they become congested and fail to act, uric acid and other impurities are allowed to remain in the system, poisoning the blood stream and causing a chain of afflictions such as Backache, Sciatica, Lumbago, Stones, Gravel, Etc.

Gin Pills FOR THE KIDNEYS

remedy Kidney and Bladder troubles by first restoring the Kidneys to a perfect state of health, and thus allowing them to function properly.

You must keep the blood stream pure—or you suffer. The modern way to prevent suffering and the ravages of Kidney or Bladder afflictions is by using Gin Pills.

Sold everywhere for 50c a box. Sample free if you write to

The Maritime Farmer
SUSSEX, N. B.

self:" Pshaw! Lightning's never been known to strike here," and boldly put down the window and lowered the green shade. As she went back she heard the rain falling heavily. "I better put a pan under that leaky spot," she thought. "Then—I'll wait a moment."

She felt a sudden inclination to enter the kitchen with its many attractions for electricity. She reached and turned the light up. At that instant the room seemed to be full of fire; the glare of the lightning seemed to have penetrated the very walls. Simultaneously came a detonation that made the house vibrate like a fiddle string. Ellen dropped into a chair and covered her head with her arms. She was deafened, sickened with the crash and with fear of the thing that caused it. Presently she heard a sound which she took at first to be the frightened thumping of her own heart.

"Ellen! Ellen! Let me in!" wailed the voice.

She sprang up and opened the door. Across the threshold almost fell Amelia Stedman. Her hair was stringy, her eyes wild, her dress wet.

"Ellen!" she gasped, as she gripped Ellen with both hands and hung to her. 'Oh, I'm so scared! The house was struck. I feel as if I'd been stung in a million places. I couldn't see for a moment. As soon as I could I got out. Oh, Ellen! Ellen!"

"There! There!" Ellen patted her. 'You're alive, and that's everything. Sit down here, Amelia. The storm's abating."

She stood beside the cowering woman, soothing her by word and touch till the storm passed into a mere growl, with an occasional flash. The rain kept up heavily.

"I'm going to bed now, Amelia," Ellen said. "You go with me. I'll lend you a nightgown. You musn't go back in that house tonight."

"I wouldn't go back," said Amelia, 'if it burned to the ground."

So she crept in beside Ellen, and after a while she slept.

Daylight came clear and bright. Ellen woke to find Amelia gone. She dressed hurriedly and ran out of doors. Amelia stood in the yard regardless of the wet grass about her feet, and beside her was Tom Cheney.

"If this don't beat all," Tom said. 'Come here, Ellen." Ellen advanced until she stood ebside him and Amelia. 'Look at that pear tree," Tom said.

The pear tree had been struck by lightning. It was stripped naked, and its bare trunk showed up white and clean. Bark was scattered about in every direction, along with fruit and leaves. Tom reached up a long arm and pulled off a pear.

"Cooked on the bough," he said. 'Just notice, Ellen."

"What a strange thing," Ellen murmured.

Amelia said nothing. She seemed dazed. "You see the pear tree deflected the bolt, caught it full and and saved the house," Tom explained. "Else—"

"Else I'd have been dead in there," Amelia shuddered. "As it is, I can never go back in there to live again. Mr. Cheney, I now put it in your hands to sell."

"Well, of course, if you feel that way", Tom said, in his large kindly way.

"I do." Amelia was vehement. "I always hated that house. I've never been a minute's real happiness. But of course I should have stayed on in it if this hadn't have happened. That lightning stroke seemed to untie something that fastened me to the house and Jake and—and all that. I feel free now, like I used to when Ellen and I were girls."

"Well, well," Tom said. He looked at Ellen, who was quite heedless of him in her tender sympathy for Amelia. "If you want me to sell the house, of course I'll do my best for you. In the meantime I suppose you'll stay here with Ellen?"

"No." Amelia spoke quickly. "I wouldn't ask it of her. I've been awful mean to her, Mr. Cheney. It would serve me right if she never forgave me." She began to cry weakly.

Ellen put an arm about Amelia's shoulders. "Of course you're going to stay with me," she said. "There, don't cry, Amelia. Come in and I'll get you some breakfast. Then you'll feel better.

"Will you give me some breakfast, too, Ellen?" Tom asked.

"I'd love too," said Ellen brightly.

After a cozy breakfast Tom said: "After I heard that big thunder-clap last night I got anxious about you, Ellen. For I knew lightning had struck here. So I came over to see. I looked in the window and saw you moving around, so I knew you were all right. But I wasn't just satisfied, so I came over again this morning soon as it was light enough to see anything. When I saw the pear tree I was pretty thankful. But it came close—it came close."

Ellen's heart was flying at the thought of the man she loved watching over her in the darkness and storm. She tried to hold up her head and look at him, but something she saw in his eyes set her trembling and flushing like a girl. A woman knows her happiness when she sees it, and Ellen knew hers. Somehow the pear tree had helped her to a friend and a lover.

Mother is Well Now

Your Noise Does Not Disturb Me Any More—It is a Pleasure to Hear You Romp and Play.

"IT is like a dream now to think of the long, weary months I spent in nervous helplessness. Some days I would be cheered by feeling better, but only to slip back again, and to be more than ever discouraged.

"I had always been very active. Had a wide acquaintance and did much entertaining. In addition to helping in whatever was going on at the church, there was Red Cross work to be done, and all the time I had my little family to look after and could not get help.

"I suppose I tried to do too much, for I got so I could not sleep at nights and always felt tired out in the mornings. Then I would have headaches and did not seem to care for my meals.

"Instead of the usual ambition and energy I found myself putting off the duties of the day. I got behind with the housework, and this worried me.

"I did not think that I was sick, but only tired. However, the time came when I did not get up in the morning. I simply could not. The doctor came and said, "Nervous Prostration." It seems I had kept on the go until the nervous system was wrung dry of all nerve force.

"Then came the long, weary weeks, and weeks dragged into months, without finding much improvement. I was completely discouraged and almost devoid of hope.

"But one day a friend told me of her experience with Dr. Chase's Nerve Food, and she was so sure that this treatment would do me good that I decided to give it a chance.

"I need scarcely say that there were some dark, discouraging days after beginning the use of the Nerve Food, but as my appetite and digestion improved I felt that I was gradually getting back the old-time vigor. Sleep became more natural and refreshing. The dark days passed and I began to take a more cheerful view of the future. Then I began to plan what I would do when I got around again. The house must be decorated and the children brought home, for I had to send them to my sister's on account of the way their noise disturbed me.

"Now I feel that I am entirely well again, and without hesitation give the credit to Dr. Chase's Nerve Food. I cannot tell you the pleasure it gives me to be restored to my husband and children after the long period of helplessness."

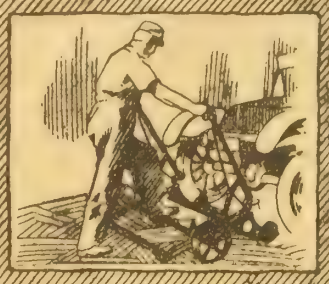
Dr. Chase's Nerve Food, 50 cents a box, 6 for $2.75, all dealers, or Edmanson, Bates & Co., Ltd., Toronto.

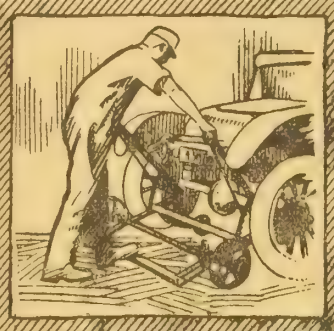
PATCHING WALL PAPER

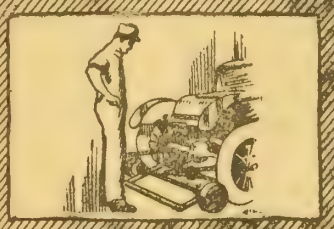
Take a remnant of new paper, pin it up on a flat surface well exposed to the sunlight, and let it fade until it matches the paper on the wall. Then cut it the proper size to cover the torn or spoiled wall-paper, and paste it over, matching the figure.

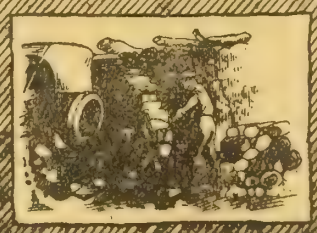
THE MECHANICAL FARM HAND

Something New — And Better — Under the Sun — for the Farmer









Make a hired man of your automobile. Use the wonderful power of its engine—use it to make your farm a bigger, faster profit-maker.

Hitch LAY Porta Power to your car and it will do double work. LAY Porta Power is a *real automobile accessory for the farm.* Weighs only 100 lbs. Stand it on the running board of your car. Drive to the job. Slip LAY Porta Power under the rear wheels of the car. Hitch a belt to the machine to be operated. Start your automobile engine. There you have any speed or power your car can produce.

LAY Porta Power

LAY Porta Power gives you the cheapest power on earth. Runs all kinds of machinery around the farm. Pumps water, runs washing machine, cream separator, churn, corn sheller, ensilage cutter, grain elevator, concrete mixer, wood saw, silo filler—any machine that any gasoline engine up to 10 h.p. will run. And all this power is *cheap* power. LAY Porta Power costs only a fraction of the price of a gasoline engine. It's portable—you take the engine to the job, not the job to the engine And you can't have a more efficient motor than is in your car.

We have fully illustrated and intensely interesting literature. Send to your nearest distributing point for it. Or send your order with $5.00 and a LAY Porta Power will be sent to you—balance of price on delivery.

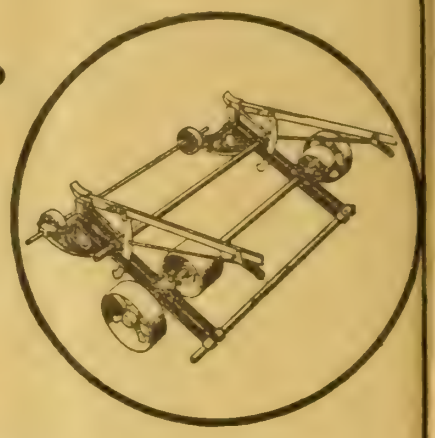
Price $48.00 f.o.b. Toronto

GRACE MOTORS LIMITED, Toronto

Here It Is

LIVE DEALERS

Farmers need LAY Porta Power. There is good profit in selling it to them. If you're a hustler—get in touch with your nearest distributing point. Your territory may still be open.



GRACE MOTORS LIMITED

120 King Street East - - Toronto

MARKETS.

COUNTRY PRODUCE

Montreal, Nov. 1st.—There seems to be a growing feeling amongst the trade that the surplus of storage eggs for export above home requirements will be very much less than was first estimated. The movement into consumption is very free, and some dealers are buying more from original country holders to ensure sufficient for their trade requirements. A sale was reported during the week at an Ontario point of a block of over 5,000 cases, at 50c. f.o.b., straight. Another car was reported bought by a Toronto dealer from a storage in Montreal at 50c f.o.b. This would seem to bear out the opinion that the surplus is less than was at first estimated. The opinion in the Prairie Provinces also bears out this view, and stocks htere, according to report, will all be needed for local consumption.

The ertreme scarcity of real new-laid eggs (specials), has caused a further advance in the price of this class of stock. Dealers stated they had found it necessary to pay from 60c to 62c, delivered. Country shipments in Ontario report sales of curren receipts at 56c to 58c, f.o.b., cases returnable, and circles are in many instances receiving 60c. Reports to hand from many coutry points state there are not sufficient eggs coming to satisfy local consumption. This is particularly the case in Western Canada. On Toronto farmers' market retail prices ranged from 90c to 95c a dozen.

From now on the weather will play an important part in production, variations in temperature affect the growing stock, and a quick change to severe cold would retard the laying of the pullets.

The tone of the local market for eggs remains very firm under a good demand for supplies for immediate consumption, anad the market is fairly active. The receipts tóday were 430 cases, as compared with 423 for the same day last week, and 804 for the corresponding date a year ago.

We quote wholesale jobbing prices as follows:

Strictly new laid eggs	65c to 70c
Fresh selected stock	50c to 54c
Storage selected stock	00c to 53c
Storage No. 1 stock	00c to 49c

The receipts of poultry showed a marked increase, the latter part of the week, but are not excessive, considering the season of the year. The market is firm in all parts of the country and well finished birds are absorbed quickly at full market prices. The receipts show a large proportion of unfinshed stock which is difficult to move except at a discount. Some light chickens are being taken by dealers for crate ceeding. The reserve stock in the freezers is still low and dealers would taake all surplus of good poultry available for this purpose if they could handle it.

We quote prices for dressed poultry as follows:

Turkeys, per lb	36c to 38c
Chickens	28c to 32c
Ducks	28c to 32c
Fowl	27c to 30c

THE BALED HAY MARKET

Montreal, Nov. 1.—There was no further developments in the market for baled hay, prices being firmly maintained, with a good demand for all offerings, which are not sufficient to satisfy the wants of the trade, and the condition of the market is becoming somewhat serious. Sales of car lots of No. 1 timothy hay were made at $26 to $27; No. 1 light clover mixed hay at $26 to $27, No. 2 clover mixed hay at $24 to $25, and No. 3 timothy hay at $23 to $24 per ton, ex track.

The farm is a great factory where one part of the machinery thrown out of kilter can cause worry, loss, perhaps disaster.

The Bridge to the British Market

The Victory Loan is a bridge over which the farmers of Canada drive their hogs, their cattle, their grain and all their surplus crops to the profitable British market.

For, the money raised by the Victory Loan enables Canada to give credit to Great Britain. And only by means of that credit can Great Britain buy the products of Canada's farms.

Therefore, when you come forward at your country's call and loyally lend your money that Canada may continue her vigorous prosecution of the war, you are also benefitting yourself and the whole farming community.

It is the duty of every earnest Canadian not only to invest heavily in Victory Bonds 1918, but to work among his neighbors to make the loan a success.

Before the subscription lists close, every man should realize the sterling character of the investment; the good interest return of 5½%; the undoubted security offered in the Bonds of this wealthy nation; and the vital importance to all classes of people, particularly to the farmers, of the Victory Loan 1918.

Buy Victory Bonds

Issued by Canada's Victory Loan Commitree in co-operation with the Minister of Finance of the Dominion of Canada

COMMON DISEASES OF THE DIGESTIVE ORGANS OF HORSES

(Continued from page 69)

and teaspoons one fluid dram of sixty minims or drops.

In prescribing we shall use the following abbreviations: lb. for pound. oz. for ounce, dr. for dram, gr. for grain, m. for minims or drops, qt. for quarts, and pt. for pint.—J. Hugo Reed, V.S.

In the Horse Department of this and in future issues we will continue Dr. Reed's advice re symptoms and treatment for the most common diseases of the horse. Preserve these copies of the Maritime Farmer for future reference.

IMPORTANCE OF KNOWING THE MILK YIELD OF THE BULL'S DAM

Not much headway can be made in breeding up a dairy herd if the dam of the bull is not a good milker. This is now a well known fact and very high prices have lately been paid for bulls out of heavy producing cows.

At the Cap Rouge Experimental Station a very fine French Canadian bull, which will be called Z, was bought a few years ago, one that would easily have won championship honours at any exhibition in Canada against all comers. Moreover, this bull, according to ordinary standards, was of a conformation which induced one to believe that he was of a heavy milking strain and would produce good heifers. But, unfortunately, such was not the case and he did not leave a single heifer which was worth keeping as a milk producer.

Cow A, to the service of another bull, produced a daughter which later qualified for Record of Performance with 7794 pounds of milk whilst to the service of Z, she gave a heifer which never gave fifteen pounds of milk per day during her first lactation period.

Cow B qualified for Record Performance as a three year old with 5332 pounds of milk, gave 4624 pounds during her first period of lactation and averaged 6117 during her first five years in milk. Her daughter, by Z, only gave 3040 pounds during her first period of lactation.

Cow C was out of a dam which qualified for Record of Performance, with 9747 pounds of milk, but herself failed to qualify though tried two different years. She only gave 3297 pounds during her first period of lactation and her daughter, by Z, only gave 2800 pounds during her first period of lactation.

Cow D qualified for Record of Performance with 8358 pounds of milk and her daughter, by Z, only gave 2776 pounds during her first lactation period.

Cow E qualified for Record of Performance as a two year old with 4547 pounds of milk and as a three year old with 5530 pounds whilst her daughter, by Z, only averaged 2731 pounds during the first two periods of lactation.

Cow F is the dam of a cow which gave 10229 pounds of milk in 365 days an dher daughter, by Z, only gave 2401 pounds during her first lactation period.

Cow G averaged 5271 pounds during four lactation periods, going up to 6224 in one of them and her daughter, by Z, only gave 2947 pounds during her first 365 days in milk.

The cost of barn room, care, feed, has gone up faster than the price of milk, so that every dairy farmer must see that he does not use a bull like Z.

LARGE AREAS OF SWAMP LAND ARE LYING IDLE

In various parts of the country there are swamp lands, varying in size from a few acres to quite large areas. In almost every case where these lands have not been reclaimed, they are covered with wild grass and trees, and in most cases are yielding nothing worth while, either to the owner or the country. These lands could be made very useful in growing certain kinds of crops and should be used for that purpose instead of practically lying a waste as at present.

Marsh lands are usually divided into two or three classes, according to the amount of vegetable and mineral matter which they contain. The terms used t odesignate swamp lands are, peat, which contains from 50 to 95 per cent. of organic matter; muck, which contains from 15 to 50 per cent., and "marsh border soils," which contain from 5 to 15 per cent. The balance of these soils is made up principally of silty or earthly matter varying from 5 to 95 per cent.

The majority of this land is of little use for agricultural purposes until it has undergone certain processes pertaining toward that end.

The first thing to be done toward reclaiming swamp land is drainage. The surplus water must be got rid of before any crop production worth while can take place. This is best accomplished by large open ditches to remove the surface water and sub-surface drainage to remove the soil water to a depth sufficient for cultivation and plant growth. Even for the latter purpose it is not advisable to put tile into fresh swamp land for two or three years, for the reason that land when drained will continue to settle for that length of time, and it is safer to use the open ditches until this is completed, after which tile may be placed therein and covered up.

After drainage has been done the land must be solidified. The action of the tile has already done a good deal in that direction, but cultivation and pressure with a heavy land roller will need to be applied in order to finish the job.

After the land has been brought into a suitable condition physically the efforts should then be directed toward properly balancing the elements required for plant food. Being excessively rich in nitrogen these soils are almost sure to eb deficient in mineral substances such as phosphates and potash. Barnyard manure will supply the deficiency to a certain extent but unless well rotted it will have a tendency to make the soil more loose, a condition just the opposite to that desired; besides under normal conditions these fertilizers can be purchased in a commercial way cheaper than furnishing them in barnyard manure, thus leaving the latter for use on other parts of the farm where it will do more good.

Acidity is also quite a common characteristic of swampy soils. Where the surrounding land, however, happens to be of a limestone formation this difficulty is likely to be overcome by lime carbonate seeping into the marsh in the spring time from the surrounding higher land. In order to overcome this difficulty the best treatment is an application of ground limestone, burnt line, air slaked lime, or lime carbonate should be used.

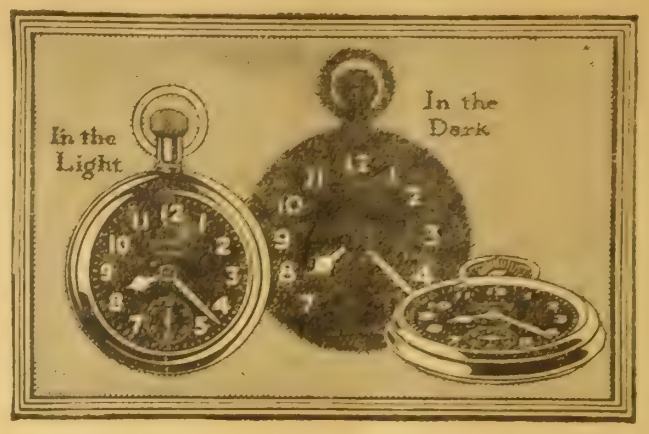
It is important to know definitely whether a soil is acid or not in order to properly treat it for crop production. A neutral soil is usually low in potassium and an acid soil is phosphorus. The drainage water from these soils is coffee colored when the marsh is acid and clear or nearly so when it is neutral. **This gives a very** good general idea of conditions but more definite informations is frequently needed an dtherefore the following simple method of testing a soil is given.

Get five cents worth of blue litmus paper from a druggist and go into the field soon after a rain, while the surface it still moist. With a jacknife cut a clean slit into the soil and insert a piece of the paper and press the soil firmly around it. After five minutes examine the paper carefully and if any red spots appear on the blue surface, it can safely be said that the soil is acid. It is best to make several tests in different parts of the field.

The crops best adapted to marsh lands include corn, potatoes, cabbage, buckwheat, timothy, and alsike clover for hay. After the land has been worked down for two or three years and has been made firm with a heavy roller and other suitable implements, other crops such as wheat and barley may be added to the list and still later oats and rye.

Marsh lands should be seeded early in the spring. On account of the tendency of this land to dry out quickly, the seed must eb sown before dry weather occurs or there will be difficulty in getting it to sprout.

Where a good catch is secured in the spring there will be little danger of



Worth More Than It Costs

THIS watch can be bought at any dealer's for $3.00. It is different from the ordinary watch because it tells time in the dark.

Real Radium in the substance on the hands and figures makes them glow brightly, no matter how dark it is, and this glow lasts for the lifetime of the watch.

You do not need to strike a match to see the hour.

On the farm, in mines, factories, camps, for outdoor work or exercise, you will find a Radiolite much more useful than the ordinary watch. It is indeed worth more than it costs.

More than 50 million Ingersoll watches have been sold during the last 25 years, and Ingersolls can be bought in any town or village just the same as in the big cities—same high quality, same low price. Ask for Ingersoll Radiolites—$3.00—at any dealer's.

Look for the words Ingersoll Radiolite on the dial.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight aud dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters. I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatmept suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

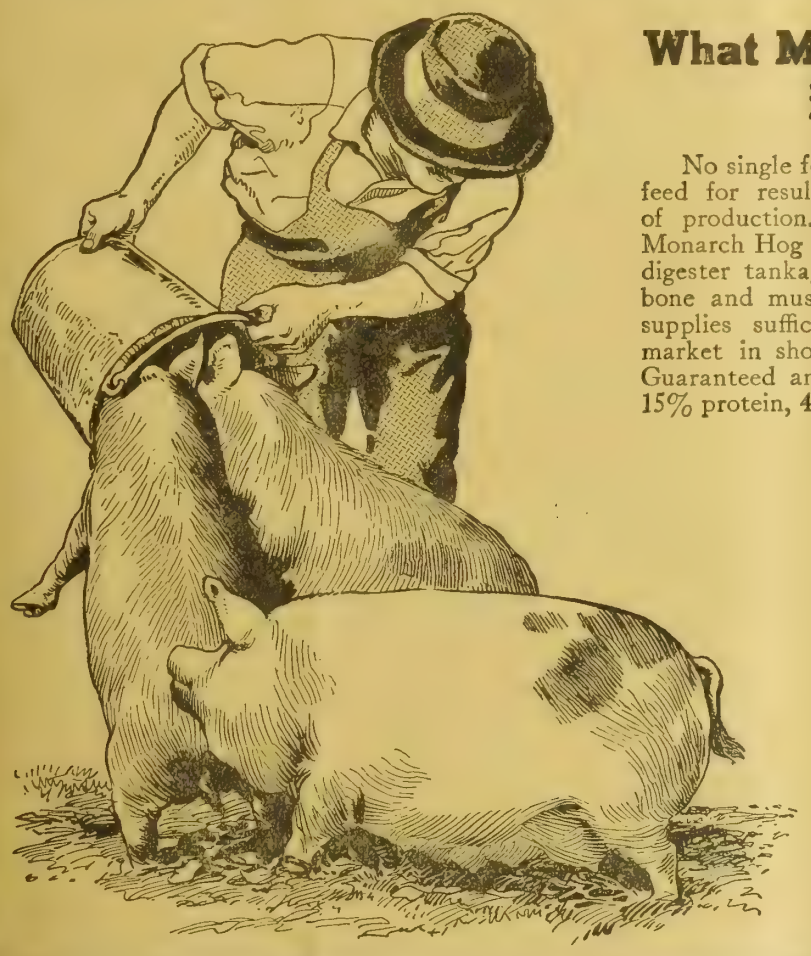
More Pork and More Profit

Heavier, Cheaper Hogs in Less Time

HOW to round your hogs into tip-top shape for an eager market at lowest cost—that is the problem Monarch Hog Feed is solving for farmers every day. Monarch Hog Feed is a properly balanced feed, supplying every requirement for sturdy hogs with stamina, energy, vigor and size; it has exactly the right proportion of protein and fat to finish your hogs in the shortest time.

Monarch Hog Feed

makes more pork and better pork; it shortens the hogs' stay on the farm and reduces cost of production; it gets hogs to market in best condition; in fact it solves the problem of economical feeding in these strenuous times of high-priced feeds—and there's money in good hogs nowadays. Improper feeding is one of the causes of soft bacon, declares Prof. G. E. Day in Ontario Agricultural College Bulletin No. 225. Monarch Hog Feed used along with the proper amount of roughage means good hard bacon that gets the best prices.



What Monarch Hog Feed is made of

No single feed can equal the properly mixed feed for results as to gain per day and cost of production. The principal ingredients of Monarch Hog Feed are shorts, corn products and digester tankage. This combination is rich in bone and muscle forming ingredients, and also supplies sufficient fat to bring your hogs to market in shortest time and in best condition. Guaranteed analysis of Monarch Hog Feed is 15% protein, 4% fat.

Monarch Dairy Feed

has guaranteed analysis of 20% protein and 4% fat. It is a properly mixed combination of Oil Cake Meal and Cotton-seed Meal with the bulky feeds, bran and corn meal. Though very rich, ensuring splendid results, it can be fed alone.

Sampson Feed

This general purposes feed is somewhat similar to Monarch Hog Feed, except that oil cake meal is used instead of digester tankage: it gives results for both cattle and hogs. Guaranteed analysis 10% protein and 4% fat.

Pigs "go for" Monarch just as they are doing in the picture. It is a palatable, easily digested feed. For profitable results it is the most dependable feed—and, remember, you can depend upon getting it, while mill feeds are often unobtainable.

Give it a trial. Order a ton from your dealer and note results. If your dealer does not handle Monarch feeds, send us his name and we will see that you are supplied.

10

e crop, as the roots will soon get ng enough to reach the water level elow the drains and the soil will be armed by the sun after the surface ater has been removed so that there ill be little danger of frost.

PROTECTING PUBLIC ROADS

If every one were as careful of the roads as they should be there would not be so many roads needing repair. Excessive loads placed on wagons with narrow tires are bad for any road. Tractors using cleats or lugs on the wheels will do great damage to the roa dsurface and should never be permitted on the public highways. The cleats should first be removed from the tractor wheels. Disc harrows or any other cultivating tool may cut up the roads. More care in the driving of automobiles or other vehicles to keep out of the ruts would help to keep the surface smooth. Every person in the community should be interested enough in the public roads to help keep them in good condition.

Money losses through depredations of rats are only half appreciated. After a full inquiry made a number of years ago, it was found that the average annual loss caused by each rat in England equaled $1.80, in Denmark $1.20 and in France $1.

Success does not so much depend on external help as on self-reliance.

Two Cents a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word, each insertion. Milking Shorthorns for Sale

We are offering some choice young Shorthorn bulls of the milking strain, ages 3 months to 15 months.

Also a limited supply of heifers, one and two years of age.

For particulars apply to

FRANK C. FAWCETT,
Successor to Bliss M. Fawcett
Upper Sackville, - - - N. B.

POULTRY FOR SALE

POULTRY FOR SALE—In Utility Barred Rocks, White Wyandottes, R. I. Reds and White Leghorns, I am offering a fine lot of yearling hens, all good layers, and some grand breeding cockerels. Special prices for immediate delivery. A few exhibition Barred Rocks, five pairs of W. C. Black Polish, and one trio of Brown Leghorns left. Satisfaction guaranteed or money refunded. H. M. McMONAGLE, Box 652, Fredericton, N. B.

AYRSHIRES BULLS !

fit for service, bred from heavy producing stock.

FRED S. BLACK & SONS,
Springvale Farm,
AMHERST, - - - N. S.

MARKET OLD HENS

The yearling hens carried over from last season have about finished laying now and will be boarders until late winter or early spring. The present prices of feed absolutely prohibit the keeping of these non-producers, and they should be fattened and shipped to market as soon as possible. Even with low-priced grain it is a question if it pays to keep the average hen after she is two years old. Production of the first and second years is usually sufficient to pay a good profit, and though a small profit might be possible during the third laying season it is not great enough to justify the maintenance of three-year-old layers. We must increase production as much as possible this year, and the execution of such a programme calls for pullets anad yearlings in the layers' quarters this fall. Get rid of the old birds and make room for the prolific young sters.

Common Diseases of Digestive Organs of Cattle

By J. Hugo Reed, V. S.

(By J. Hugo Reed, V. S.)

In the last issue of the Maritime Farmer we published an article by J. Hugo Reed, V. S., on "The Common Diseases of the Digestive Organs of the Horse." In this issue Dr. Reed deals with diseases of cattle. Preserve these copies of the Maritime Farmer for future reference.

The Ox

When we use the word "ox" we refer to cattle in general, regardless of sex. The stomach of the ox, being such a complex organ, is more liable to digestive derangement than his intestines. In order that the reader may more readily understond and appreciate the different diseases, their causes, symptoms and treatment, it may be wise to describe the anatomy of the oesophagus and stomach.

The œsophagus or gullet, passing from the posterior portion of the pharynx or cavity posterior to the root of the tongue, is a tube composed of mucous membrane surrounded by muscular fibres. These fibres surround the mucous membrane, and, like other muscular fibre are contractile. When a bolus of food is passing down the tube the fibres expand, and immediately contract after the bolus has passed. The œsophagus, after passing through the thorax or lung cavity, pierces the diaphragm (the division between the thoracic and abdominal cavities) then expands and enters the stomach as a somewhat funnel-shaped dilation; the mucous meembrane is plentiful, somewhat folded, and continuous with the mucous membrane of the stomach.

The ox is usually spoken of as having four stomachs, but this is not strictly correct, as there is but one organ; but it is more or less completely divided into four compartments, called for convenience the first, second, third and fourth stomachs.. Technically these are called, the rumen, reticulum, omasum and abomasum. The rumen, paunch or first stomach is a very large compartment, occupying about four-fifths of the abominal cavity, situated principally on the left side, extending well back to the pelvis and having an average capacity of probably about thirty-six gallons. The reticulum or second stomach is situated to the front and right of the rumen. It is a comparatively small compartment and not well divided from the rumen. In fact, the division is so imperfect that it would be difficult to distinguish one from the other if it were not for the arrangement of the mucous membrane; that of the rumen being smooth like that of the œsophagus, while that of the reticulum ssrongly resembles an empty honeycomb with the top of the cells cut off. On this account the compartment is frequently referred to as "the honeycomb." The omasum or third stomach is to the front and right of the reticulum. It is a small organ with a capacity of about 1 and ½ gallons. The mucous membrane of this compartment is formed into leaves of different depths. In fact, when it is empty it appears as a compartment of leaves of mucous membrane, on which account it is often referred to as "the many-plies." These leaves are thickly studded on each side with elevated epithelial cells, which grind food as it passes through. To the right and posterior to this compartment is the abomasum or fourth stomach, which is the true digestive stomach and contains the gastric glands. That is comparatively small, if scapacity probably being between three and four gallons. At the posterior portion is a constricted orifice called the pylorus or pyloric orifice, with which the small intestine is continuous.

Digestion in the ox (with the exception of that which takes place in the small intestine) is supposed to be carried on as follows: He eats large quantities of bulky food, eats it rapidly, hence does not take time to masticate it well. It enters the rumen, the muscular coat of which has both transverse and longitudinal fibres, the contraction of which lessens the calibre of the organ in all directions, and, of course, their relaxation correspondingly enlarges it. During the time the animal is eating this contraction and relaxation is continuous, producing a somewhat churning motion which thoroughly mixes the contents with each other and with the liquids that are present. When the animal has satisfiied his desire for food the process of rumination or chewing the cud commences. This is supposed to be performed somewhat as follows: The muscular fibres mentioned contract firmly, this compresses the contents of the organ and forces it forward, the dilated end of the œsophagus closes and, in closing grasps a portion of the ingesta and by a reurgitative or antiperistaltic action it is returned to the mouth for re-mastication. This process being performed the bolus is swallowed. If there still be any imperfectly masticated portions they are supposed to again enter the rumen, while the finely masticated and the fluid portions pass directly to omasum by what is known as "the œsophageal canal," which consists of two double leaf-like folds of mucous membrane which extend from the œsophagus (hanging downward) to the omasum. When a bolus of re-masticated food is being swallowed the lower edges of the folds approach each other and when they meet a canal is formed which carries the ingesta to the omasum. Then another bolus is regurgitated, re-masticated and swallowed, and this continues until the process of rumination is completed. It will be seen that the cud is simply a portion of the contents of the rumen returned to the mouth for re-mastication, hence the too-common idea that cattle suffer from a disease known as "loss of the cud" is false. In most cases of digestive troubles the process of rumination ceases, but when the disease is cured it will again be performed.

It must not be thought that all the contents of the rumen undergo this process at any time. Only a limited amount is operated upon at once; hence, in health the rumen always contains a large amount of ingesta.

The re-masticated food having entered the omasum it fills the spaces between the leaves, which press upon it, and, having a slight motion, one upon the other, still further grind it and press the fluids in the abomasum. These gradually pass into the abomasum, where true digestion really commences. It will be seen by the above that the functions of the first three compartments are simply to prepare the food for digestion which takes place in the fourth stomach.

When from any cause any of the functions mentioned are checked, suspended, interrupted or materially altered, digestive derangement will be noticed, the causes, symptoms and treatment of which we will discuss.

Tympanitis, Bloating, Hoven or Blown

Causes.—This condition known by many names consists of distension of the rumen with gas. The most fruitful cause is a sudden change from dry food to an unlimited supply of green food of any kind, principally to the different varities of clover, and more particularly when the clover is in flower. It frequently occurs from the voracity with which cattle that have been kept on dry food all winter consyme green fodder. Hence, it is more prevalent in the spring than at any other seasons. It results from feeding too freely on green food of any kind, especially on that upon which dew or rain is present, and more particularly when frosted; hence is not uncommon in the fall when the cattle are allowed to consume clover, rape, turnip tops, etc., when frosted. Any food that readily ferments, if taken in sufficient quantities to temporarily check digestion, will quickly form gases and cause bloating. It is often a complication in cases of choning, the mechanical impediment being the cause by preventing the escape of gas through the gullet. Sudden changes of diet of any kind may cause the trouble, or insufficient sercetion of saliva may have the same effect. While some of the above-mentioned causes usually precede an attack, it is not uncommon to notice a well-marked case for which no well-marked cause can be traced. Such cases are doubtless due to some unsuspected and not well understood temporary derangement of the digestive glands and muscles of the rumen. Any condition that causes torpidity of the rumen may cause bloating, even though no change of food of a dangerous nature has taken place. Torpidity of the rumen occurs in debiliating diseases, in fact in most diseases of the ox, also from the introduction of excessively cold material as frosted fodder, into the organ.

Symptoms.—The patient commences to exhibit signs of uneasiness, lying down and rising frequently, and kicking at the belly. Rumination is suspended and food refused. There is general depression, protusion of the muzzle, projection and congestion of the eyes, increased flow of saliva, and generally moaning during expiration. The back is arched and here and there is more or less marked swelling of the abdomen especially marked on the left side, especially between the point of the left hip and the last rib. If this be pressed with the finger it will yield, but at once regain its former condition pressure is relieved. If tapped with the finger a resonic, tympanic or drum-like sound will be heard, hence the name "tympanitis." Distension of the rumen causes forward pressure upon the diaphragm (the division between the abdominal and lung cavities), hence lessens the degree of bloating. In many cases forcible ejection of fæces per rectum is noticed. In most cases there are eructions of gases of a special odor. The bowels soon cease to act and breathing becomes more difficult as the tympany increases. Teh brain frequently becomes involved to some extent, the patient becoming blind, staggering and falling. Death may occur quickly from rupture of the rumen, rupture of the diaphragm, suffocation, or absorption of gases.

Treatment. — Preventive treatment consists in avoiding sudden changes of food, especially from a dry to a moist or green ration. All changes should be made gradually, When cattle that have been accustomed to dry fodder are to be turned out on grass, especially any variety of clover, it is good practice t ogive a moderate meal in the stable then turn on grass for a few minutes, say twenty to thirty minutes. Next day leave on grass for a longer period, say forty minutes, and continue to gradually increase the period in order that the animals will become less inclined to engorgement and the digestive organs gardually acquire the power to perform their new functions. In a few days it will be reasonably safe to allow the cattle to remain on the pasture. Much greater danger exists at any time in allowing cattle that are not accustomed to green fodder to partake of it when frosted, or damp with either dew or rain. Frosted grass ,rape, turnip tops, etc., are very dangerous under any conditions.

Curative treatment must be directed to remove or neutralize the gases that

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

NOVEMBER 19, 1918

DATES OF ISSUE.

November 19
December 3-17

ATTEND TO REPAIRS

Now that the live stock is housed for the winter, unless small repairs that tend to the comfort of the animals have been already attended to, it is now an opportune time to do so before the rigors of winter set in. The practical stock man does not need to be told that every little comfort bestowed upon the live stock during the season they are, so to speak, at man's mercy for food and shelter.

Is your stable a dungeon without light or ventilation? If insufficiently lighted why not cut several openings in the proper places for windows and insert a few sashes of glass or frames covered with cotton—the latter will give light and a fair amount of ventilation without drafts. A raid on cobwebs with an old broom, followed by a coating of whitewash will make the stable a place where you will rather delight in spending some extra time in looking after the comforts of your stock, instead of a place from which you wish to escape as soon as possible.

A great many stable floors are made of poles or planking. In either case, after a period of time the softer parts of the wood will wear down, leaving the harder knots protruding, much to the discomfort of the dumb animals that are compelled to lie on them. A few strokes with an adze, axe or chisel will soon cut off these hard knots to the level of the surrounding floor, and we are very sure that your stock, were they able to say so in words, would heartily thank you. There is no excuse for rough, uneven floors in the stables. Such floors should be gone over carefully to remove knots and to drive spikes or nails that may be protruding from the wood.

Can the cold winds blow in under the floors of your stables? If so, why not spend a few hours doing some banking, and stopping up the chinks in the foundation walls. All ti will cost is your own labor, and this will be well repaid by the saving of feed that the added warmth will effect. If the stable walls are not as proof against the admittance of cold as they might he, the farmer's own ingenuity will tell him what may be done to improve conditions.

"The merciful man is merciful to his beast" is an old adage, and one that the well thinking farmer will heed. Nothing can be more cruel than to tie animals in stalls where they famish with cold, when a few hours work effecting repairs at this season would save them unnecessary suffering.

HOUSE THE FARM MACHINERY

Now that operations in the field are about over for the season, look around to see where your farm machinery is housed. Is it possible that mowers, rakes and reapers, as well as cultivators and seed drills are still in the open?

We know some farmers who are very careful of their farm machinery. As soon as a machine is no longer needed in the field, it is put under cover. In fact, careful farmers find it a paying investment to build a shed where machinery is kept under cover except during the hours when it is in actual operation. Farmers of this class find that their machines last many more years than do similar machines in the hands of the careless.

How often a plow, a mowing machine, rake or other implement is left in the fields to rot and rust. We have seen farm machines of every description emebdded in ice out in the fields as we travelled throughout the provinces. It is bad enough to leave the machines in the open, but it is worse to leave them on ground that is flooded and covered with several feet of water and ice during the winter season.

We know farmers who own mowing machines that have been in use for over twenty years and are still in good repair. We know some of the above mentioned afrmers' neighbors who have allowed three or four similar machines to rot and rust in the field during that time. This is a big leak. Stop it. If you have not a proper machine shed, build one as soon as possible, you cannot afford to go without one any longer. In any case oil the parts that are subject to rust and put forth an effort to protect the machinery in some way from the elements.

HOUSE THE LIVE STOCK

Jack Frost is now issuing his daily reminder that the Winter Season is fast approaching. The live stock is, in most cases, housed and must be fed. While the fields remain uncovered many farmers follow the practice of allowing their stock to graze the frozen herbage. We often see live stock in the open while driving, cold, wintry rains are drenching them, as they are striving to gather enough food to eke out an existence. During cold wet or windy weather, we believe the live stock could more profitably be kept in their stables. Nothing is gained by subjecting stock to adverse weather conditions. Frozen grass is not conducive to the accumulation of muscle or fat, and discomfort will very soon cause even the most thrifty animals to rapidly loose flesh.

WERE THE SCIENTIST AND FARMER MEET

Horsemen caution us against allowing the young colt to nurse the mare while she is heated from hard work. Dairy men tell us, if we want wholesome milk, to handle the cows gently. Swinemen caution us to keep the brood sows quiet. But why all these precautions? The answer is—excitement, worry or over-heating the animal has a very detrimental effect on the milk. The inquiring mind is not satisfied with the answer. Just what effect do these various causes have on the milk of the sow or the cow?

Here is where the scientist comes in. The layman has found that certain conditions or causes produce certain effects. We learn by observation and sometimes costly experience what nature does under certain circumstances. We cannot analyze or explain the chemical changes which take place in the milk. And so it is with many things the farmer has learned by experience. He states them for truths and facts.

But the scientist in answer will say—I do not take much stock in it because I have no experimental data which proves it to be so. Or perhaps he may think it a superstition handed down from our forefathers to the "hollow horn" school. He sometimes smiles at our statements. But being a painstaking and hard working fellow, he continues with his test tubes and magnifying glass and after a while announces a discovery. The announcement reads something like this: "Prof. Smith has recently discovered by a series of experiments with the milk from heated and angered animals, that analysis reveals certain acids and poisons present in quantities sufficient to produce rheumatism, colic and various other ailments, often very serious or fatal to the life of the young." It is now our turn to smile and say (if we like) I told you so.

WHERE WE FOUND OUR PROOF

Haven't we been started often enough, on going into the barn to find a fine big colt rolling violently with the colic, to have known about that heated milk long before the scientist worked out his problem? Didn't our grandfather know it wouldn't do to dog the cows? That to allow a sow to be worried by a dog or from any other cause would be very injurious and sometimes fatal to her pigs even after they were six weeks old; that it would be almost sure to cause rheumatism or big joints, or indigestion? But he says navel infection causes the big joints. Sure that does it, too. But we knew that the milk trouble was caused by something in the milk produced by the condition of the animal and we also know what that condition was.

After all, we like the scientist and every day his assistance is ebcoming more helpful and more necessary.

* * *

A soil that is well supplied with phosphorus and lime goes a long way in producing a good crop if it has a fair chance.

* * *

The best breed of poultry is the one you like best.

* * *

Clean stables, clean cows, clean milk utensils and cleanliness in milking is what produces sanitary milk for human consumption. Is your milk clean?

* * *

It is not what the hog eats, but what he digests and assimilates, that brings the profits out of the feed consumed.

* * *

The boy with a pig of his own to-day is the livestock man of to-morrow—provided his father does not beat him out of the money the pig brings.

* * *

Now is the best time to gather up and sell all your old junk in the way of iron and steel, rubber, paper, bones, etc. Prices are not only exceptionally high, but the material is actually needed; and the results in your pocket-book will be much more artistic and satisfactory than the junk piled up in your fence corners or your yards where the stock can run over it and be crippled. Of course, we think you should save your papers for reference. At least, you cannot afford to throw them away or burn them at the present high prices for old paper.

FOUNDATION FACTS OF DAIRY INDUSTRY

An Address by Prof. J. M. Trueman before the Nova Scotia Dairymen's Association

Mr. Chairman, Ladies and Gentleman:

I am glad to have the opportunity of standing before the Dairymen of Nova Scotia. I have had the opportunity of meeting with the Dairymen's Associations in different parts of the country where the Dairymen were, I will not say wider awake than in Nova Scotia, but where dairying was an older business, or where the pushing of the business to build up a big dairy industry, had been going on longer than in Nova Scotia. I do not know that milking cows was as old in some of these states as some of them were wild states when Nova Scotia was making butter. Nevertheless, the big centres and a growing demand for dairy products had forced the dairy business ahead at a faster rate than in Nova Scotia.

You will know that my business at the present time is not connected so closely with the manufacturing as with the producing of milk and the breeding of dairy cattle. Mr. MacKay has asked me if I would not spent a little time emphasizing facts with which you are alrealy well acquainted, and which are perhaps truisms, but which are at the foundation of the business.

You men in the creameries can only be successful if the farmers bring you enough milk to carry on your business. Let us take a few minutes in putting into orderly array our ideas in re milk production.

I take it there are three things necessary for the production of milk. You may be surprised at the one I put first. It is not the cow, it is not the feeding of the cow. It is not the feed which the cow eats; It is not the cow herself, it is the dairyman. Now, it is important to have a man who thinks and a man who has stored away in the cells of his brain knowledge that he has built up by years of work in the proper handling of cows. You may say never mind about the man, give me some great cows like the ones in the barn at the Agricultural College and I will get the milk no matter whether I ever saw a cow before or not. You will not do it; you will ruin her in six months or milk her so that she won't produce half as much as she should produce. It is the man who handles the animal who must have the knowledge and that is where we come back to every time.

One time in Connecticut I was asked to give a speech and told to choose a subject. I said I would talk about the dairyman, and they said that was a very peculiar subject to talk about, the man himself. They knew what they knew and it was no use to talk about them. I might speak about his temperament and his ambitions, but one thing is of vital importance and that is that he should be a lover of animals.

I remember a man whom I once knew who was driving a stage coach. About every other day that man would get mad and give the horses a licking, and would keep them in a nervous condition, so that they were never able to do the work and nobody was ever satisfied. It works the same way with a cow, the man who, every time the cow does not do just as wishes, remonstrates with her with the stool, is not going to make a success.

I used to wonder what the man who drove the staeg coach was good for and used to say he was good for nothing. However, eventually we found a place for him running a gasolene engine. When the engine does not work right, it is no good for him to beat it. He could not make anything by getting mad at the engine so he kept cool and used his brains. So if you have a man who cannot keep his temper, give him a tractor.

We have the man first, the cow second and then the feed to give her. These are the three important things.

Let us consider the cow as to her breeding. You might get a pure bred cow that would sell on the market at from $400.00 to $500.00, but this is not the kind of cow you want to give best results. I have seen many men ambitious to get into the breeding of pure-breds. I would not give this advice. One or two here and there who have had the experience, have the capital and the ambition can make a success of pure-breds to furnish the foundation stock to use with a grade herd. In this Province the greatest improvement in the dairy herds will be made by the use of pure bred sires, and in buying a pure bred sires, and in buying a pure bred sire care should be taken to study up his ancestry. Too many bulls are sold simply because they are pure breds and not on account of their record.

It is the work of the Agricultural College to build up a herd which will provide pure bred sires for the grade herds of the Province. You will never get any sympathy from me if you come to buy pure bred females unless I recognize that the man has the ability to go ahead with the pure-bred business in which case I am glad to do what I can for him. What we can do for Nova Scotia is to get the best females to be found and sell their sons to improve the herds all over the country. This is the work which our best breeders of pure-breds are doing.

These bulls should be taken good care of and be used for a number of years. A man told me today that he had to sell his Ayrshire bull because he was getting cross and he was only three years old. If he was a good bull, he was just throwing him away as far as breeding was concerned.

If you get a good bull and breed to grade cows, the next generation will be more than half as good as their dams. In the second generation you will use the same bull on the 50% heifer. This generation will be 75% pure. The next time you may use another bull just as good, preferably bred along the same lines in an endeavor to get a definite strain of blood introduced into your stock. In this way you will get the progeny 87% pure.

So by buying a bull of the right kind and using him on these grade cows and keeping this up for five generations, which means ten or twelve years work, you have your herd 96 7/8% of the right blood.

In too many instances the breed is shifted. If you have been working on the Holstein and change to the Shorthorn, you break down the work you have been doing. This is the story. I might talk here for a week and give lecture after lecture, but I cannot tell you anything more about breeding. I prove your stock on the plan of "every time a little". Have every generation a little better than before.

One reason you get discouraged is that you do not get a bull good enough. The price is the smallest thing. When you pay $200.00 for a bull you are a great deal more likely to take care of him. The trouble is that we do not buy good enough bulls. We buy poor bulls and after a year or two they are turned over to the butcher. We shift and shift and have not a chance to select as we have to use about all the bulls that are born from decent cows. If you would buy bulls and keep them for ten years, I would have to throw away the bulls that were not up to the highest mark, but as it is we have to scratch around the country to find enough to go around, and we have to use the poor ones.

I do not want you to think that I am opposed to the right man going into the breeding of pure bred cattle, but I will say that the general farmer who is producing milk, is better off with this kind of stock than he is to try to breed pure stock. Even if they do sell a a high price, there is nothing in it in the money way, and you had better leave it for the men who have time, ability, capital and a chance to keep posted on it.

We would soon crowd out the breeder who was not giving us the best of stock if we did not kill the bulls off so much. A man came to me tonight and told me the experience his society had. First they bought a good bull which gave them good results; then they bought a poorer bull and he was not satisfactory, then they bought another and he was not satisfactory. Now they have come to the conclusion that they must go back to a good breeder and put more money into a bull.

I will just take time to very briefly impress upon you some facts in regard to the feeding of cows.

Just to keep a 1,000 lb. cow for one year, just to maintain her so she will do her work, just to pump the blood, just to keep her warm and enable her to move around, would take 255 lbs. of protein and 2892 lbs. of total nutrients. In order to produce 8000 lbs. of 4% milk, she will require 520 lbs. more of protein and 2800 lbs. of nutrient. This will be supplied by 4280 lbs. hay, 5330 lbs. turnips, 428 lbs. of bran, 428 lbs. middlings, 214 lbs. oats, 428 lbs. cotton seed meal and 5 months pasture.

When you give her 775 lbs. of protein and 5692 lbs. of nutrient, you must remember that you have to feed her 225 lbs. protein and 2892 lbs. nutrient to just keep her alive. If you were to figure the cost for feed, it would be as follows:

Hay	25.68
Turnips	13.37
Bran	8.56
Middlings	10.70
Oats	6.42
Cotton Seed Meal	12.84
Pasture	10.00
	87.54

You will have to add for expenses $60.00. Do not think that all it costs to keep a cow is to feed her. We have to add to that the labor which is equal to $40.00 anyway, and then there are the various items, taxes, insurance, veterinary attention, bull service, etc., which will make a total of not less than $60.00. The cost of keeping a cow is, therefore, $150.00. If she gives 320 lbs. butter fat at 40c, the returns are only $128.00. Add to this skimmilk, manure and calf and there will be a small profit. I would call your attention to the fact that it takes as much for the actual maintenance of a cow giving 4000 lbs. as for a cow giving 8000 lbs. This would be a good thing to impress upon your patrons' minds. Make them understand that a cow giving 4000 lbs. of milk costs as much to maintain as a cow giving 8000 lbs. It costs so much to maintain an ordinary cow, that you cannot possibly make anything out of her.

Get a cow that will eat a lot of feed and will make the right use of it and there is no reason why we should not run our average production from 3500 to $4500 or 5000 lbs. As I figure it today, you cannot possibly come out any more than even until you have a cow that will give 6000 and that is a long way from the average of Nova Scotia cows. It is possible to get them and that is why we are keeping cows that will give 12,000 lbs., 15,000 or 16,000 lbs. We keep a bull from a cow that gave 18,000 lbs. Breeding from this kind of stock, if we stick at it, will work up the average eventually and we should, as creamery men, encourage the patrons to buy the best, encourage proper feeding; not extravagant feeding. If we work hard at this we should in a few years have an average of 5000 lbs. for our dairy herds.

When we have done this we will e that much nearer the realization of the goal Mr. MacKay set before us and it will mean a very great thing for the farmers and for the creamery men.

EVERY FARM IS BENEFITTED BY HAVING TOOL EQUIPMENT SUITABLE FOR REPAIR WORK

The location of a workship on the farm is one of the important things about it. It should be centrally located, not only in relation to the other buildings but to the fields as well. If there is a tool shed on the farm, this is an ideal place for the workshop. The tools, then, need not be removed to another building when being repaired. If the farm is located near a town where the services of a competent workman may be had, at short notice, the work in the shop can be easily attended to without much expense and loss of time. But as is the case with the majority of farmers, it would be necessary to go from two to ten miles in order to procure a good mechanic. It, therefore, is necessary for the farmer to be his own mechanic.

Every farm will benefit by having an equipment of tools proper for handling the repair work. The ax is probably the most important and should be of good quality. Then the half hatchet, hammer, draw-knife, crosscut saw No. 8, brace and bits, as well as good chisels, will be found the most serviceable. That is, they are the most needed for repair work in wood. To these should be added a steel square, spirit level, plane, and rule, if very much construction work is to be attempted. A claw bar is almost indispensable on most farms, for the pulling apart of old buildings and extracting of spikes and rusty nails. The steel and iron-working tools are almost as indispensable on the modern farm as are the wood-working tools. A number of sizes of monkey wrenches should be procured. The general-purpose size is a 12-inch. A set of wrenches or an alligator wrench will be fund useful in getting into tight places. I think the next in importance to the wrench are the riveting hammers, cold chisels, and files. If one wishes to do some of his own black-smithing, a small forge and anvil will be found a valuable addition to the farm repair equipment. For working in sheet metals and repairing metal roofings, a soldering iron is needed.

For working in leather, few tools are needed. A leather punch, rivet set, awl, and harness clamp are about all the tools needed. No workshop deserves the name unless it has a serviceable workbench of some sort. This should be fitted with good vise and planing stop, and should stand about 34 inches from the floor. The iron vise may be on the same bench as the wood vise, but it is more convenient to have this on a separate bench that is of more substantial construction than the wood bench.

Good windows are of great inportance in a workshop. Most of the work in the shop will be done on dark and rainy days and it is such work as will require all the light that can be obtained. In a shop 16 by 24 feet, at least 6 windows should be provided, 3 on each side. If the building is erected especially for a shop, a bench should be placed along each wall, one for woodworking and the other for metal. If a blacksmith outfit is to be installed, this can occupy the back third of the shop. This part of the building should have a dirt floor. The rest of the shop should have a plank floor. The door to the front part of the shop should include all of the space between the two benches so that the largest of the farm machinery can be brought into the shop for winter repair work. The blacksmithing part should also have a large door so that horses or machinery can be brought into this part of the shop without interfering with work in the other part of the shop.

Some of the tools necessary for the farm workshop are as follows: Crosscut hand saw, claw hammer, half hatchet, ax, steel square, spirit level, twist drills to fit carpenters' brace in sizes ½, ⅜ and ½, solid centre wood bits, chisels, draw knife, jack plane, bench vise for wood, bench planing stop, saw files, boxwood rule, wrecking bar, saw set, wire pliers, screw driver, etc. A crowbar and an assortment of carriage and machine oblts, wood screws and nuts, a keg of 7 and 20-penny nails, five pounds each of 3, 4, 5 and 6-penny nails, and ten pounds of fence staples, 1 and ½ inch.

HORTICULTURE.

SUSSEX AND STUDHOLM AGRICULTURAL SOCIETY HOLD ANNUAL MEETING

The 1918 annual meeting of the Sussex and Studholm Agricultural Society was held in the Agricultural School, Susser, on Monday, November 11th, at 2.15 p. m. In the absence of the president, J. T. Prescott, J. F. Roach presided. A report of the various lines of activity carried on under the auspices of the Society was given by the Secretary. It was resolved that the Society continue the same lines of activity as during the past season, including the holding of the annual Seed Fair and the co-operative purchase of fertilizer.

The election of officers which took place in open meeting resulted as follows:

President—J. Frank Roach.

Vice-President—A. D. Freeze.

Directors—H. R. McMonagle, W. F. Mosher, Wm. Jamieson, H. B. Parlee, Wm. Venning, J. W. Patterson, Kenneth McLeod, Harry Wallace, R. S. Parlee, F. S. Sharp, Alex Cook, Walter Craig, D. A. Walker.

Representative to N. B. Agricultural Societies United—J. D. McKenna.

Delegates to N. B. Farmers ano and A. D. Freeze, with F. S. Sharp and H. Wallace as substitutes.

M. A. McLeod was re-elected Secretary-Treasurer by the newly elected Board of Directors, which met immediately after the close of the annual meeting.

The Directors decided to start a drive for new members by each Director making a thorough canvass of his district before the end of the first week in December. The membership fee to the Society is $1.25, which includes a year's subscription to the Maritime Farmer.

The Directors will meet at the Secretary's home early in December to compile results of the new membership drive. Each and every farmer in the parishes of Sussex Studholm, Cardwell and Waterford should be a member of the Society.

The fertilizer order book will be kept open until the December meeting of the Directors to give new members an opportunity to place an order for their requirements for the season of 1919.

Are you a member? If not join the Society that represents your calling by handing your name and $1.25 to any one of the foregoing named officers of the Society. .

The war is over. The production or munitions is no longer one of the necessities of our empire. Men will gradually be released from military duties and the prospects are that in the 1919 seeding season labor will be more plentiful than it has been for the past few years.

The farmers part in the war was an important one. They nobly and well played their part in the Empire's second line, of defence on the farms. Their efforts, we are told, must not be abated. Food is urgently needed and will be needed until such a time as the devasted areas of Europe are brought back to a state where their peoples will no longer be absolutely dependent for their food supplies on outside sources. As never before, under the newer conditions that are bound to prevail, it will be necessary for the farmers of each district to co-operate. Begin now by joining the Society.

THE HOME-DRYING OF DAMP WHEAT FOR MILLING PURPOSES

Each year thousands of bushels of damaged wheat are treated and cured in privately owned "hospital elevators" in Canada then shipped to the mills to be gristed, the flour put upon the market, bought and used for bread-making. New Brunswick wants just such flour today. The market is crying for it. We have the mills, and, the damaged wheat, but no "hospital." What can be done for our damaged wheat crop?

The rough and ready home-cure must here be applied and applied with vigor and at once to save the crop from bin-burning, heating, and molds.

Wheat that is allowed to heat becomes fire-fanged or moldy and it cannot then be used for any purpose. But if the excess moisture be driven off before much heating has taken place, it will make good standard flour. Wheat sweats just as hay, potatoes and roots sweat after being harvested. How to get rid of the moisture is the problem in each case.

Sheaves of wheat taken to the barn in a damp condition will sweat in the mow, but will dry off without damage if but slightly damp. In some cases the bands or twine may need to be cut and the straw scattered over the haymows to dry sufficiently to thrash. The sheaves will thresh much easier after the freezing weather sets in, meanwhile the barn doors should be opened widely every fine day to permit a draft.

If wheat sheaves have been threshed when very damp the sweating takes place in the granary bin, or in bags, barrels or puncheons in which the grain is stored. The air does not penetrate these, heat develops, and when cooled the wheat has a musty smell. It is then useless for grinding.

Thousands of bushels of wheat already threshed are stored in hogsheads, in damp granaries and outhouses. This wheat, if held in such storage, will spoil. No "cold storage" plant can preserve its quality. It must be "dry cleaned" at home.

A method of every-day use in western elevators to handle damp wheat is to change the wheat from one bin to another. This method is effective there and will be effective in your case. Empty the hogsheads of wheat into a bin and if necessary shovel it over again into another bin within a week. Keep it moving as soon as heating is indicated. Ventilating shafts such as laths or strips of board shoved down through the heaps of wet grain—or a piece of stove pipe pierced wtih holes and the bottom plugged will keep small bins of wheat from heating, and a barrel of stone lime is useful to absorb the moisture.

If your granary is full and space limited, install a plasterer's stove, or any kind of stove and keep a fire burning, provide for ventilation of the building and the wheat can be brought to milling condition with the approach of freezing weather.

Dirty, damp wheat can be dried and greatly improved if run through a fanning mill with a strong blast of air. Damp, dirty wheat yields damp, dirty flour, for the "scalper" at the mill will not screen out the weed seeds, dirt and broken smutty kernels. Then, before going to the mill, clean your wheat, and as a final "dryer" range the grist around the stove for a day or two.

The drying of damp wheat is not a local problem only—good flour is made every day from damaged wheat. Wheat-saving is imperative today and is the why of the "Victory Loaf." Wheat is scarce.

Try, then, these methods to bring your damaged wheat into milling condition.

Dept. of Agriculture,
Fredericton, N. B.

FALL PRUNING OF BERRY BUSHES

Raspberries and blackberries are considered by the majority of people to be the best small fruits we have for table use. Even when they are selling for double what they usually do, we see the poor as well as the rich buying them by the crate for preserving purposes. In order to keep all the raspberry and blackberry plants in this state bearing in good shape each year they must be properly pruned. You will hear people say, "What is the use of pruning, my plants bear every year?" That is not what we prune for; we prune to make the plants bear more every year and keep free from disease. It used to be the custom to do all this pruning in the spring, but there is a great rush of work at that season of the year and many times the pruning is only half done or not done at all. Also it is very hard to tell which canes are lod and which are new in the spring of the year. The best and proper time to do the raspberry and blackberry rpuning is during the latter part of August or first of September after all the crop of fruit has been harvested.

Removing the Old Canes

Raspberries and blackberries are fruits which grow wood the first year and then the second year this wood produces berries. So after the second year's growth of the cane is past, it is no good to the plant for fruit production. It should be removed at this time in order to give all the vitality of the plant to the fruit-bearing canes. When the canes are cut from the plants they should be piled in heaps and burned so as to destroy all insects and diseases on them. By doing this every fall you will keep your plot of raspberries or blackberries in a very healthy condition.

Thinning the New Canes

At the same time that the old canes are cut out the young canes and suckers should be thinned. In doing this thin out the weak canes and suckers, leaving the strong healthy ones for the next year's fruit crop. This gives the canes left more sunlight and a better chance to make a strong growth. To get a good crop of very fancy berries it would be best to thin the canes so that they are about six to eight inches apart.

Pruning for a Late Crop

Some people who do not want only enough raspberries for their own use have a system of pruning so as to extend the fruiting season from two to four weeks. It works out quite well on a small patch, but reduces the crop too much to be a profitable proposition for the commercial fruit grower. All the canes are cut back to within about one foot from the ground in the fall to cause the late fruiting the following year. The strength of the plant the following spring goes to the lower buds first and a long shoot is made before the flowers appear on the canes. By this late flowering process you can make your patch of berries bear for a long time during the summer. Prune part of the patch for a late crop and prune the rest as you would ordinarily, and your season of

Fashion Favors These Amherst Styles

With their graceful lines they possess a definite and dignified air of distinction that has won for them an enviable reputation in fashionable circles.

This good name is further enhanced by reason of their unusual wearing qualities.

Your shoeman will be glad to show you the newest Amherst models.

Amherst Boot & Shoe Company Limited, Amherst, N.S.

WHEAT

We will purchase good, dry, clean New Brunswick Wheat at highest market prices, according to grade.

Flour, Feed or Cash in payment.

Write us for full particulars, stating quantity of wheat you have.

FOWLER MILLING CO., Limited,
WEST ST. JOHN, N. B.

fresh raspberries will be several weeks longer than it would be under normal conditions. A. M. PORTER.

HOME-GROWN GARDEN SEED

The Experimental Farms Branch in a circular just sent out, very strongly urge upon every vegetable grower the need for growing his own seed, so long as there is danger of a seed shortage, which is very much the case at present. The experts of the branch suggest that growers mark the best plants of each vegetable grown in the garden and save these for seed rather than to take seed from what remains after the plants have been cropped. The following minimum number of feet, plants or specimens to be saved is suggested as being sufficient to supply enough seed for the home garden in 1919; Beans, 5 ft.; corn, 1 ear; cucumbers, 1; lettuce, 3 plants; melons, 1; peas, 5 ft.; radishes, 3 plants; spinach, 3 plants; squash, 1; tomatoes, 3. Either reserve a few feet of the row of beans, or, better still, mark a few productive plants free from disease.

The seed stalks of lettuce are thrown up after the heads are full grown. The seed ripens rather unevenly and, in order not to lose any of it, each head should be picked over as it shows white, it being necessary to go over the plants every few days. The plants can, however, be pulled and hung up to dry.

If some radishes are left unpulled, after being ready for use, they will soon throw up stalks, and good seed will develop. For best results the plants should be at least six inches apart.

Spinach, if thinned to six inches, will produce an abundance of seed. In saving home-grown seeds, it is important to dry them as soon as possible after they are ripe, then clean them and keep them dry until needed the following spring.

Peas and beans will soon be spoiled for seed if they do not dry rapidly in the pod after being harvested. As corn sometimes has to be pulled before it is quite hard, it is desirable to see that there is a good circulation of air around each ear. A good plan is to husk the ears and then stick each one separately on nails driven into a board and far enough apart so that the ears will not touch.

The seed of tomatoes for home use should be saved from the plant bearing the largest crop of early and best fruit. Where a quantity of seed is saved, the tomatoes may be cut in half and the pulp pressed out into some vessel, adding about one-third its volume of water. Put in a dark room until fermentation sets in, which will be in about two days, when the seed will separate readily from the pulp. Wash out and dry where the sun does not shine on it.

Following are the quantities of seed which one might expect:—Beans, 1 or more ounces per plant; corn, 300 to 600 kernels pe rear; cucumebrs, ⅛ to ½ oz. per specimen; lettuce, ¾ oz. per plant; muskmelon, 1 to 1½ oz. per specimen; onion, ⅛ oz. per plant; pea, 4 oz. per 3 feet or row; pepper, 1/16 to ⅞ oz. per specimen; radish, 1 oz. per plant; spinach, 1¾ oz. per plant; squash, small, seeded, 2½ oz. each; squash, large, seeded, 3 oz. each; tomato, 50 to 300 each; watermelon, 2 to 3 oz. each.

APPLE, KING OF FRUITS—CIDER, QUEEN OF DRINKS

(By Frank B. McMillin, Mount Gilead, Ohio.-

Fruits supply in superior form a number of elements that are absolutely essential to the well being of the human body and brain. But of all our varied and fascinating range of fruits none can hope to ever attain the popularity of the apple. There is no fruit that lend itself to such varied uses and none that can take its place as a food product. Apples lead all fruits in North America for the amount grown and the money value inivolved. Our total agricultural apple crop for one season would make ten piles as large as the Great Pyramid of Ghizeh, or would wrap a band around the earth at the equator a foot thick and seven feet wide. The immensity of the industry is little comprehended by most people. Almost every state in the Union produces apples and in most parts of the United States they are one of the leading staple products of the farm, whereas the larger share of other cultivated fruits rank as luxuries. Apples agree with everyone and are found everywhere. They are at once the poor man's fruit and the rich man's dessert. All ages, conditions and kinds of people relish them, yet the rightful place of the apple in our national diet is all too little appreciated.

As a matter of fact, apples merit a universal use as a medicine as well as a food. Analysis shows that they contain albumin, sugar, gum, malic acid, gallic acid, fibre, water and indisepnsable organic salts such as potassium, phohphorous, calcium, magnesium, silica and sulphur. The age-long veneration for this king of fruits is found to be well justified upon scientific investigation. So marvelously are health-giving properties combined in apples that blood and muscle, bone and nerve all receive peculiarly valuable nourishment and one can readily imagine that the ruddy hue of the apple is in a measure imparted to the complexion of the eater. The preponderance of base-forming elements in apples tend to neutralize the harmful effects of our ordinary American diet of too much meat and denatured cereals. The acids of the apples diminish the excess acidity of the stomach and purifies the blood. Their plentiful use will add to our happiness and length of days by aiding in the elimination of impurities from the system and strengthening the digestive processes.

When we consider that the skin and cores of apples are anything but digestable, we recognize that it is really the juice—some ninety per cent of the whole—that contains the valuable elements for which apples are justly famed. Pressing out the juice does not lessen the value or change the essence but merely alters the form. Therefore whatever food and medicinal properties may be ascribed to apples are likewise contained in pure, sweeet cider. Furthermore, the chemistry of nature takes the raw juice and by the process of fermentation and clarification renders it highly agreeable to the palate and even more effective as a tonic. All the mineral salts of the apple and all its esters and other desirable bodies are carried over into the cider, as will be attested by any chemist who takes the trouble to investigate.

Eminent physicians throughout the civilized world acknowledge the hygenic properties of cider and recommend it for quite a series of diseases such as indigestion, rheumatism, kidney trouble, stone, gravel and gout. As a preventive and cure for various gastric ills, cider is unsurpassed. Its wholesomeness as a beverage and effectiveness as a remedical agent is championed by many of the most distinguished physicians and scientists of Europe and America.

The objection of some that the use of cider may create an appetite for strong drink does not seem to be borne out by facts. Few drinking men care anything for sweet cider; to many of them it is positively distasteful. On the other hand ,nearly everyone who has no appetite for liquor is fond of good cider. This is especially the case with children. Ginger ale, coffee or tobacco are more likely to create an appetite fro liquor than cider, as they are stimulants.

While the juice of the apple is converted first into cider, its usefulness as a food product increases as the cider is made into cider vinegar, apple syrup, boiled cider, cider jelly and, last but not least, apple butter. The pomace, which is rich in pectin, is also used very satisfactorily for jelly stock. In many places it is being used with splendid results as feed forcattle, hogs and sheep.

The market for good cider and cider products is far greater than the supply and the business offers unusual attractions. Wherever apples are grown great quantities of small, unmarketable fruit go to waste anually. hese under-grade apples represent a valuable asset of good food as well as an excellent source of profit to the grower when properly utilized. An average of over four gallons of cider can be easily obtained from each bushel of these waste apples by the use of a modern hydraulic cider press. The invesment required is not large and the upkeep is nominal. The pressing season comes at a time when farm work is usually not urgent. Very little mechanical knowledge is required for successful operating. There is undoubtedly room for a great many more cider mills throughout the apple-growing section of our country.

Especially this year the apple grower who permits fruit to lie on the ground and rot is not only losing good money for himself, but is wasting a much-needed food right at a time when great numbers of the world's population are actually starving. Gather up all your waste and surplus apples, take them to a modern hydraulic cider mill and make available just that much more good food. Besides the enjoyment of delicious apple products for your own household, there is splendid profits to go into your pockets from the ready sale of the surplus. Don't let any cull apples go to waste this year.

Investing by Mail Popular

We are receiving a steadily increasing number of customers all over the Dominion who purchase stock and bonds by mail.

These clients are so well pleased with the security, convenience and profitableness of investing by mail that they are freely recommending this plan to their neighbors and friends.

DAIRYING.

COW CO-PARTNERSHIP

(By Chas. F. Whitley.)

In the science and practice of dairying, it is recognized that several factors contribute to success. At a dairy convention only a few can possibly be considered, so may I offer a remark or two concerning man's finest servant, and how her service may be rendered still more useful through cow testing?

"Finest" was used advisedly, for what domestic animal is more patient, more completely useful than the dairy cow? Some day a poet lauareate will appear to immortalize her, redeeming her from the joke page of a fifth-rate artist's so-called comic paper; she well deserves it, for day in (and night out) she works unceasingly, ungrudgingly, with no expectation of reward. To her we all may look in admiration; on the character of some of us perhaps, she, the symbol of contenment, the perfect embodiment of exquisite unselfishenss may have some reflex action. The extent of her enormous task is not always fully appreciated, the giving of her actual self in the breaking down of tissue, while laboring at the secretion of milk 24 hours per day—a contract indeed to an average farm horse, working less than five hours per day and costing far more than Bossy to feed.

In this age of organization and cooperation essential to include a thorough overhauling of all dairy herds. As these times demand that all lines of endeavor must render service, is it not incumbent on every dairyman to assure himself of the exact measure of each cows participation? It is hardly good business, is it, to keep, blindly, the cow that gives a scant 4,000 lb. milk when from others in the herd a bounteous weight of full six tons may annually be derived.

Every man is interested in the upbuilding of the dairy industry, believing that it makes for the prosperity of our glorious Dominion. It is an old truism that the foundation of good dairying is the cow: but please note, not any common, ordinary old cow, but the cow of distinction, selected on her records as one worthily filling her mission of profitable yields. Obviously due credit should be given to each partner-cow for her contribution to the total wealth of the firm, the point is that we need it down in black and white whether she delivers the goods to the extent of 150 or 350 pounds of fat. On that important point cow testing alone can satisfy your enquiring mind.

To get the best results this co-operation evidently must be genuine, complete, not fragmentary. Are all of our dairy cows today getting a square deal? From the humane standpoint it appeears that some merit better treatment; here and there the milk of human kindness needs to be clarified so as to leave no sediment of ungentleness. Our cow testing records indicate plainly that where the alliance between the herd owner and the cow is one based on honest dealing, there is ready response on both sides; the cow does better as she is treated better, and the owner does better as she, through the milk records, teaches him her needs.

Fellowship, comradeship, gives mutual advantages. The good cow helps the owner climb, the cows improve as the people on the farm are appreciative. Time and again our records have shown how better care, more liberal and more judicious feeding have completely altered the financial situation and helped to build both herd and farm.

A herd in one of our Ontario dairy record centres has a marked instance of the direct results of such treatment, with an increase in yield from 5,460 lb. milk to 9,428 per cow in two years, seventy per cent. more milk from the same cows.

In the table following some remarkable contrasts are to be found.

Comparisons in a Herd

Average Yield 18 cows, 4,915 lb, Milk, 3.4 Test.

Average Yield, 18 cows, 161.6 lb. Fat. Value $56.56.

Average Profit, 10c. per lb. Fat, Feed cost $40.00.

Cow No.	Lb. Milk	Test	Lb. Fat	Value Fat at 35c.	Profit per Lb. Fat
1	3,440	4.0	140	$ 49.00	6c
2	3,550	3.8	137	47.95	6c
3	6,210	3.7	234	81.90	18c
4	3,474	3.5	123	43.05	2½c
5	5,460	3.5	194	77.90	14c
6	4,520	3.2	147	51.45	8c
7	9,750	3.1	307	107.45	22c
8	5,316	2.8	151	52.85	8c

These figures reveal contrasts that occur frequently. In this herd of 18 cows the average yield is 666.6 lb. fat; omitting the ten nearest that average the individual tests are seen to run through the whole scale from 2.8 to 4% of fat. The lowest yield of fat is from a six year old contributing only 123 lb. of fat to the general wealth; on this is made, above the feed cost of $40.00 a profit of barely two and a half cents per pound of fat. The highest yield is from a seven year old giving 307 lb. fat, on which is made a profit of twenty-two cents per pound, more tha neight times as much.

With the eight cows tabulated above, the profit is $22.65 per cow above feed cost: but if the three lowest yields of fat are omitted from the eight, the profit stands at $32.45 each, or almost ten dollars aditional per cow.

This partnership with real cows means almost more than one can dimly outline in a few minutes. If man is known by the company he keeps, some of our records make us wonder if a few dairy cows would like to choose other owners, they might then have needed oportunity to make good. Many others, both cows and men, advertize their own good old home farm, so excellent are they.

In the real community, where pooling and harmony of interest are maintained, good results are apparent. Where all the partners are active, not sleeping; where each is thoroughly interested in the live, going concern; where complete understanding exists; where the working basis is sensible and economical; what a chance there is for abundant productoin! And the selected cow rises to the bait every time.

For where our cow testing work is in operation we find districts averaging 6, 7 and 8,000 lbs. milk, over 240 lbs. fat per cow for as many as 500 cows.

The formalities of partnership are clear enough, the objects well defined; you and the cows deal in certain commodities, acquire certain properties and make certain articles. From whichever angle you view cow testing, ii must be admitted that to Ontario dairymen it is most valuable, it is more, for it is absolutely indespensible to real success.

With due mixture of capital invested in good cows, and intelligent labor in field and stable, one may rely on a good day, a good month and a good year. Profits are not from an accidental hit on a fleeting big pay streak in the live stock gold mine, they result from steady, permanent growth fostered by the enlightenment of cow testing.

You may take in $300 from your 20 cows some one month, but is not the vital point a definite knowledge not only of income from each during the whole year, but the net profit each one earns? If it is only $10 now, you can soon make it $70 profit per cow.

While it may not be possible for every man to own many champion prize winners, yet as the herd can only average up well if each individual member is good, it follows that a study of each one as a separate entity must be made if real development is to follow and if income is to be increased.

Can you by such study improve your present output? Do your 10 cows bring you $350 clear profit, Will any of your cows give two dollars and fifty cents worth of butter in return for one dollar and a quarter's worth of grain? Do you get better results from feeding 1 lb. of grain for every 2½ lbs. of milk produced or for every 5 pounds? Can you get 5% or 20% net prolt on your investment? Does Old Spot give you 9 or 19c prolt on each pound of fat produced? Such questions are answered definitely by cow testing, for its modern business methods rest mainly on attention to the individual in order that resulting totals may be classed A1; not as a dead, inanimate machine, or as machine-made, turned in a lathe to one pattern.

If one should be tempted to ignore the wisdom of linking arithmetic with cows, it may be well to remember that this ancient and exact science if numbers helps tremendously in every phase of modern preparedness. Not a battleship moves, not a gun is fired, not an aircraft soars, but figures are used, checked and rechecked In the dairyman's war against loss he wisely counts, daily he calculates where saving retrenchment can be made, where advances are justified, from the elevation of his superior intelligence he computes values; at every turn he needs arithmetic.

Indeed it may be claimed that the better type of dairyman, the one who would not dream of neglecting his daily weighing of each cow's milk, and balancing her account annually, is a distinguishing mark of modern civilization; for is that not just the outcome of what cow testing recommends system, order and method, as opposed to mere chaotic barbarism? We can hardly picture a barbarian using a Babcock or a feed record; but the mod-

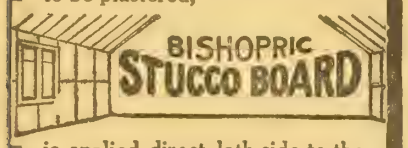
HOW THE FARMER BUILDS

He examines carefully—he figures closely—and he puts up a substantial house and barn, at a big saving of time and money—by using Bishopric products.

BISHOPRIC STUCCO BOARD

is made of sulphide Fibre Board with bevelled undercut lath embedded in the molten asphalt mastic under great pressure. It comes in panels 4' by 4', but if longer lengths are required, same will be run on request. Ready to be nailed direct to the studding, lath side out, as a foundation for stucco outside the building or plaster inside.

For interior walls and ceilings not to be plastered,



is applied direct, lath side to the studding, leaving the fibre board exposed, giving an excellent sized decorative surface for any class of interior decoration.

Bishopric Stucco Board makes warmer, drier and better buildings and reduces cost over lath and plaster. A carpenter can apply it quickly and without muss or dirt, or you can do the work yourself.

Study our book on Bishopric products for the farmer. Mailed free on request

ern, aiming at perfect manhood, builds up, constructs; he has this positive goal in view, to better himself, his herd, his farm—therefore he figures.

Our dairy cows throughout the Dominion consume probablyl eighty million dollars worth of feed a year. This is a business worth figuring about. Assuming a successful farmer works three thousand hours in a year, how much per hour do your cows make for you?

Whether cows are of correct structural style of architecture befitting their breed, or incline more to the ornamental, they will be subpected to the finding of the scales and test by men who are particular. The precise dairyman, the successful one, wants no trappings and trimmings till the fundamentals are assured, the solid base on which he builds must always be the selected cow, his plans and specifications are records of milk production and feed cost.

The argument for this partnership with cow capitalists may be further clinched. Cow testing educates the herd owner, whether young or old, and necessitating only a nominal first expenditure must appeal to those who seek affluence.

Men induced to commence, though at first sceptical, have frequently become dairy enthusiasts and good local preachers of cow testing because of the education it imparts.

Then from the intensely practical side of increased revenue and profit, it calls with no uncertain voice.

maintained. To omit such aim is to negate our birthright.

So the wisest among our dairymen, our farmers of far sight, clear vision, and big ideals, take up cow testing and reap rich rewards.

Let me give you another definite case; in two years sixty patrons of two creameries who were keeping records made a gain of 71 lb. fat per cow, or 8 per cent. The other patrons who were not cow testing fell off 87 lbs. fat per cow, or 17 per cent. Note what might have been: if all patrons had increased like the sixty did, there would have been an additional make last season of 58,000 lbs. butter. You know what butter is worth.

Fortunately our farmers are not touched alone by this purely monetary consideration. To the call of these awful times for men, they have responded magnificently. You turn now with broadening conceptions of responsibilities towards encouraging conceptions of responsibilities towards encouraging each cow to "do her bit" through true partnership is to be of timely, valuable service to the nation.

FAT TEST OF SWEET AND SOUR CREAM

One frequently hears people discussing how best to handle cream to secure the highest test at the creamery. Unfortunately some of the means suggested for securing a high test are not the best for the quality of the cream or the butter churned from it. E. O. Hanson, of the Minnesota Agricultural College, writing on this matter, says: Many have been led to believe that by holding their cream until it was real sour they would be given a higher test. This would be possible under one condition and that is, if a can of cream was allowed to stand for a long time at a rather high temperature, there would be enough moisture evaporate to increase the per cent of fat slightly, but this would be very slight and in that length of itme the cream would no longer be fit for food. Still this would bring no higher price for the product as the extra per cent of fat would only make up for the amount of moisture which evaporated.

To illustrate: If there were 80 lbs. of sweet cream, testing 30 per cent. fat, in this amount there would be just 24 lbs. of butterfat. Supposing this were allowed to stand until five pounds of moisture has evaporate, this would then leave 75 lbs. of cream testing 32 per cent. fat. It would also yield 24 lbs. of butter-fat and it is needless to say that the butter made from this 75 lbs. of so-called cream would not be fit for human consumption.

On the twenty-second day of May, 1918, the question was again asked in this way, "How do you know cream will not test more when it is sour?" On this same date the writer tested eight different samples sweet, of one pint each, using retested glassware and one of the best cream scales the market has to offer, making these tests in duplicate, and found that they ran as low as 16.5 per cent. up to 38 per cent. They were then kept in air-tight bottles and sealed with paraffin to prevent the escape of any moisture. They were held at approximately 80 deg. F. for ten days. They were then tested again, using the same test bottles to avoid any possible error and again tested in duplicate. The first results were not at hand while the latter were being read. In comparing the two results they were found to be exactly the same. It may be true that in some cases a higher test has been reported when the cream was sour, especially in thin cream. If a can of cream has been allowed to stand for any length of time and becomes sour, the milk solids settle and become very sour and firm, this making it almost impossible to get the can of cream thoroughly mixed. Therefore the sample which is taken will not represent the contents of the can it is taken from, as you realize there would be practically no fat in the milk solids which are left unmixed. Therefore many have been led to believe that cream would really test more when sour. If a higher test is given it is neither fair nor accurate.

Increases in Yields, Listowel, Ont. Dairy Record Centre

Herd	No. of Cows	In Four Years of Cow Testing Last Year's Yield Lbs. Milk	Lbs. Rat	Increases per Cow Lbs. Milk	Lbs. Fat	Per Cent. of Milk Increase
A	9	7,309	260	3,528	132	93
B	17	8,625	275	2,970	90	52
C	5	9,445	300	3,216	108	51
D	9	10,118	339	3,049	100	43
E	10	10,197	333	3,541	114	53
F	16	10,391	360	2,762	114	36

The increase noted in these six herds, samples of many others, afford wonderful encouragement to every dairyman. In four years the average addition to income has been the value of over 3,000 pounds of milk and 109 lbs. fat, that is at least $35.00 per cow. Both small and large herds have gained; the first herd shows actually 93% more milk, many other dairymen are now aiming at notring short of 10,000 lb. milk per cow instead of the old contentment with 6,600.

With no narrow-gauge view of life our best dairymen are truest patriots, for they broad-mindedly seek and absorb the best of other countries. Denmark taught us cow testing, the means to this definite end, on which always the emphasis will be loid, that is, the highest possible yield of milk and fat commensurate with moderate cost, the best possible cow that can be reared, the best possible herd that can be

AN INDIANA BULL STORY

"Buy better bulls" is the admonition of the Indiana Department of Agriculture. The further advice is given, "When you buy, get a good one. He transmits to his calves what he inherits from his ancestors. Look for a good individual with a pedigree showing high production records. If an older bull, he should have high producing daughters. His sire should be a good breeding bull with as many high producing bulls as possible. His dam should be a well-made individual, a good breeder, and have a high production record." The Department strengthens its counsel with the following story: "A few years ago a good dairy bull was purchased for use in one of Indiana's dairy herds. This bull cost $100 as a calf and was used on a herd of cows whose average production was 4,800 lbs. of milk and 260 lbs. of butterfat. The daughters of this bull have now replaced the old cows in the herd. These daughters exceed the production of their dams by 102 lbs. of butterfat and 1,828 lbs. of milk per cow per year. This improvement nets $300 profit each year in a herd of ten cows. It was a "bully" good investment."

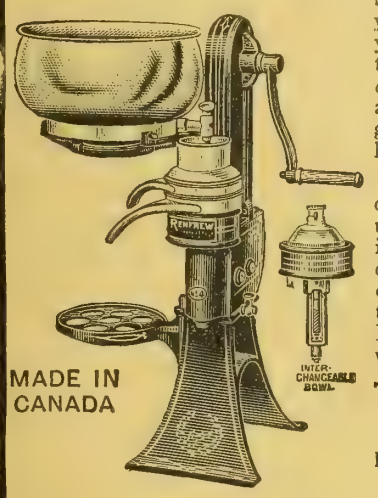
Let the Babcock Test Put You Right

SUPPOSE a tax collector came along and demanded from you a tax of about $4.00 on every thousand pounds of milk skimmed! That is the penalty you are paying by operating an ordinary separator that loses so much butter fat per 1000 lbs. skimmed that you would be astounded could you see it piled up in pound prints. Don't feed costly butter fat to pigs—save that needless tax on profits by getting the Renfrew.

Let the Babcock test put you right. It is an eye-opener for users of ordinary separators. Send a sample of your skimmed milk to one of the Government Dairy Schools. Then compare the result with the Government Dairy Schools' tests of Renfrew skimming on page eleven of our catalogue. How long will it take the saving of butter fat, with *your* output of milk, to pay for a Renfrew? We will tell you.

Renfrew

Send us the result of your independent Babcock test and your total amount of milk skimmed per year. We will, without obligation on your part, tell you how long it will take to pay for a new Renfrew *out of savings*. Is it good business to go along working in the dark? Investigate now—it may eventually mean hundreds of dollars to you!



Write for the Renfrew illustrated catalogue describing many exclusive up-to-date Renfrew features, including the curved wings, the automatic oiling system; the easy-running and easy-to-clean features are a revelation. Write to-day—and accept our Babcock test suggestion if you really want to save money.

LIVE STOCK.

FARM CHEMISTRY TAUGHT THE FARMER BY THE COW, THE HORSE AND THE PIG

The lot of domestictaed animals on the farm is seldom considered from the natural point of view, and it is from this lack of consideration that many fail to get the best results from animal husbandry When these animals were free to roam the prairie from place to place seeking only to sustain and furnish life and sustenance for the reproduction of their kind, the laws which govern their actions met with few obstacles in accomplishing the natural results. But since being domesticated by man they have beeen placed under highly artificial conditions. wrere their capacities are taxed to the utmost. When they had their full liberty they could follow their instincts in selecting the food to manufacture into materials for the various needs of their bodies. How essential it is then, that those who substitute treatment of their own for that which nature prompts, should understand well. everything pertaining to the life, health and vigor of the animals on the farm. It is right here where the correct start is made, and the stockman who can best substitute nature in his methods of feeding and attention is the one who will make animal husbandry a profitable success. There are many conditions to be taken into consideration in regard to the domesticated farm animal. but that of supplying the proper feed in winter time is the one which meantime should be exercising the thought of the farmer. And the three prime necessities in any well selected ration are **succulence, digestibility and palatibility.**

Cows give the largest amount of milk when on good pasture and are generally in the best of health. and though giving large returns in milk, also make rapid amends for the loss of flesh and vitality, on the rough and ready winter keep. Horses gather flesh quickly on summer pastures even when they are in the season that demands their hardet labor. Pigs are "in clover" in a small summer run. and poultry fill the daily egg basket with only half the care and attention they get in the winter time. Can these conditions be extended? To a great extent they can and for this reason the farmer is urged to study his feeding operations from the summer standpoint, and the first call will be for **succulence in feed and its twin brother, plenty of good air.**

One of the greatest questions suggested by a study of the feeding problem is that of keeping the animal comfortable. The more heat required to warm the animal the more fuel or food is wasted. Chemistry teaches that the air in which a cow lives should be comfortably warm as well as pure. It is essential to the life of either the cow, horse or pig that they get an abundant supply of oxygen so that their internal manufacturing processes be fully accomplished. Abundant oxygen simply means lots of fresh air. All other good things in the life of farm animals will not avail if pure air and comfort is denied them.

Succulence

Nature's feed then for the farm animal is grass. and all their organisms are fitted to deal with such succulent feed. Green feed is more easily digested than is dry coarse fooder, such as hay. straw or fodder corn. Less energy is required to digest it, and it tends to keep the body and digestion in better condition, stimulating the appetite. Apples are not specially valuable from the standpoint of nourishment for the human body; their value is due to the fact that they tone up the whole systetm and satisfy the craving for something succulent. In like manner it pays to supply live stock on the farm with something succulent. The whole ration need not be of a succulent material. but that a portion of it should be such is essential for best results. Ensilage is one of the cheapest succulent feeds. The silo is the great canning plant on the farm, the one that carries over the sunshine of summer for winter use. **Ensilage is good feed, handy to deal out and very much relished by stock.**

Roots are another medium for supplying the necessary succulence, and for small herds, where the erecting of a silo would be too expensive, they fill the needful at less expense. An acre or so of roots, planted on rich, well-prepared land and well taken care of, will provide sufficient succulent feed for six cows. A few roots per day will impart vigor to the horse, and put a shine on his coat as nothing else can. That alone is true indication of health and proves the value of succulence in horse feed. They are of equal value in the pig pen and poultry yard, and the inmates will largely waste other more expensive feeds if their digestive systems are not toned up wit hsuccu-lent root.

The timothy hay, straw or corn-fodder prescription for feeding cows, is nothing more than a precarious existence that barely carries an animal over the winter to a summer chance, resulting in a loss of as much in the six months' winter period as it is possible for them to regain in the six months' grass period. The lot of the horse or brood mare ,kept in similar conditions is equally hard. Change the operation of feeding so that some sunshine may come to them all the year. It pays to supply succulence.

Palatability

Palatability is also an important factor in feeding. The chemist can tell which feed, feeds or rations are suitable to produce milk in the dairy cow, beef in the steer or energy in the horse, but the universal solvent is the palate of the animal, and upon that depends the health of all animals. In almost every class of food, anything that adds to its palatability aids digestion. Even though agreeable flavor may add nothing to the energy of a food, yet an animal relishing its food will have a greater flow of digestive juices, and the nutriments of the ration will be better dissolved and assimilated by the body. Even in the bare subsistence ration of hay and straw, there can be material difference in feed value if their palatability is looked after. In this class of food the manner of harvesting rules both digestibility and palatability, and therefore its value.

Completeness of digestion depends largely on the palatability of the food, for woody over-ripened hay, or mouldy badly stored fodder of any variety, however good its chemical analysis may be, loses a large part of its value. Any farmer can, wtih a little variety of added feed suited to stimulate the saliva flow in the mouth, aid the greater digestion of hay that has unfortunately been spoiled by adverse weather conditions on the farm. Damping it with water in which has been dissolved some molasses, the application of some seasoning condiments on the market, or even the judicious use of salt, will help greatly. These do not add nutritive value to the hay or fodder; their efficiency is found in the more complete digestion that is stimultaed by their use.

Digestibility

The measure of a food's value is its digestibility, and to ascertain this quality is the dariyman's or stockman's most important duty. Animals differ very much in respect to digestive ability. It is this observance of the feeder that spells success with live stock. Nearly all ailments of farm animals are produced by disturbances of the digestive organs. Digestibility, as has bee npointed out, depends generally upon the succulence and palatability of foods, and thus it becomes the sum of the two latter.

The stockman's object is to use the cheapest food to make the horsepower. beef, bacon, milk, butter or cheese, and the nutritive element in the foods grown on the farm can be conserved and utilized to good acocunt by one farmer, while it may become unprofitable by the wasteful non-obesrvant operations of another. All depends upon the man who takes these into consideration that farm animals are living things, with organs that respond and act according to the treatment they receive. **In these times of expensive concentrated feeds, winter days give the opportunity to consider what can be found in the feed barn more succulent and more palatable, and the digestive organs on which depends so much of the success desired, will respond with better health to the animal and more profit to the husbandman.**

SUNFLOWERS FOR SILAGE

On several occasions during the past two years reference has been made to the experimentation being done with sunflowers for silage purposes, but nothing definite has been given about Canadian experiments. This year the Saskatchewan agricultural college has been going into the matter, and has made a very good showing. The Manitoba Free Press refers as follows to the work done there:

"The university farm at Saskatoon has entered upon an experiment which may prove of very great value to the Canadian west. namely, the testing of sunflowers as material for filling the silos. Everyone knows that there is an enormous amount of nourishment in the seed of sunflowers, but the use of the whole plant is something new. The experiment has not been carried far enough to warrant the university issuing anything official, but no possible harm can result from telling the story of what has taken place so far.

'|The university of Saskatchewan does not claim that the idea originated with them at all. They are following in the footsteps of the Montana Experimental station at Bozeman, where some four years ago a small patch of sunflowers was grown, cut green and fed to cattle. The result was so satisfactory that the station has since grown large enough quantities to feed both in the green stage and cut up and put in silos. Several investigations led to the belief that dairy cows not only liked the feed in either form, but they produced milk and butter in quite as satisfactory quantities as when fed corn, cut green or as ensilage.

"Proceeding on this data, the university at Saskatoon has grown this year a sufficient quantity of sunflowers (some 36 tons' to test it out along with ensilage made from green oats. The sunflowers were cut when the heads were just forming. The stalks contained a large amount of succulence, about 90% water, and were easily cut with an ordinary cutter as are other crops used for ensilage, such as corn, oats and peas. The stems are solid ,and being very juicy, it is easily packed in the silo.

"The university also fed some of the freshly cut sunflowers to the dairy cows. They ate it up clean what was given them. It has a sweetish, rather oily taste.

"The sunflowers were sown on May 25, at the rate of 20 lbs. to the acre, with an ordinary grain drill, in rows 36 inches apart, by stopping up the inter-drills. The late spring frosts did not injure the plants, and the cutworm left them severely alone, while they totally destroyed the corn and mangels in the same field. The early fall frosts did not harm them either. The average of sunflowers for the four years on the experimental plots was 60,'00 pounds per acre, while the average yield of north-western Dent corn for the same period of years was only 19.700 pounds.

.,As has already been stated, the university is making no claim to a complete experiment, so far they have not had an analysis of the composite product, and, of course, have no definite feeding results, but the experiment will b watched with very keen interest and if it is sucessful ,it wil lsolve one of the big feed problems in the more arid districts of the west.

"The wild sunflower grows everywhere, and where the wild sunflower grows the cultivated sunflower will grow also. The sunflower in the Canadian west attains an enormous height and seems to thrive under any conditions. If it proves to be a good ensilestimate the value of the discovery."

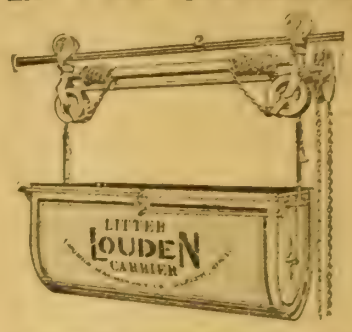
COTTON SEED MEAL OR OIL MEAL

(Hoard's Dairyman.)

The price of cottonseed meal hsa been fixed at $53 f.o.b. mills in Arkansas, Alabama, Mississippi and Georgia. This makes it figure about $63 Boston rate.

According to Henry and Morrison a good grade of oil meal contains about the same amount of digestible protein as good 36 per cent. cottonseed meal. The oil meal contains 140 lbs. per ton more of digestible carbohydrates,

LOUDEN
LITTER CARRIER



Are you Short of Help this Season?

If so, let the LOUDEN Litter Carrier help you solve the labor question. It not only saves time but turns a disagreeable task into an easy one—and you have the satisfaction of knowing that the LOUDEN Litter Carrier is always where you need it—and ready. Ease and safety in operation. Simple and strong in construction. Thousands in use and thousands of farmers satisfied. They pay for themselves many times over.

which is equal in feeding value to the digestible nuterients from three or four bushels of corn.

The present price of oil meal figures out about $60 Boston rate. Therefore, you might say that the oil meal gives at least $6 more feed value for $3 per ton less money.

It looks like cottonseed meal is due for a decline to us to make it more in proportion with other feeds. What do you think about this proposition? What do your readers think of it?

Ohio. D. BROS.

So far as chemical anaylses are concerned, it may be stated that prime cottonseed meal and oil meal have practically the same feeding value. There is a difference, however, in the properties of these feeds, and which is not measured by chemical analysis. It is our belief that a feeder can afford to pay more for oil meal than for cottonseed meal when there are no succulents suc has silage or roots to form aportion of the cow's ration. When there is silage it does not make very much difference whether the feeder uses cottonseed meal or oil meal, but we would prefer oil meal if we could obtain it at the same price, even to use with sucuclent feeds. Where there is nothing but dry feeds, we would pay several dollars more per ton for oil meal than cottonseed meal, because oil meal has a laxative effect upon the animal's digestion.

We are satisfied that feeding experiments rave not yet determined all the qualities of oil meal, but we do know from parctical experience that is is a most excellent feed for dairy cows. If an animal is run down, out of condition, so to speak and given a little oil meal regularly it will usually show its effect in a very short time.

Neither oil meal nor cottonseed meal should be fed in large quantities, that is, not more than two pounds per day to obtain the best results.

Whether the price of cottonseed meal will be any lower than at present we are unable to say. We must bear in mind that there is a shoratge of feed and it is quite possible that cottonseed meal will be picked up at the price stated in this letter, even though oil meal can be purchased a little cheaper at the present time. The chances are that the price of oil meal will advance to be on an equal basis with cottonseed meal. It is our opinion that our readers would prefer oil meal to cottonseed meal at the same price and many of them would pay a little more for it.

NO PROFITABLE COWS FROM ILL-FED CALVES

The ordinary calf will consume two gallons of whole milk a day. In six months this would amount to about 112 pounds of butterfat. It really takes no figuring to see that butterfat is too expensive to feed to calves.

The new born calf must receive the first milk or colostrum of the mother for the the first few days. The calf should be fed new milk for at least two weeks, and if the calf is not robust it is safer to continue the whole milk three weeks before beginning to substitute skim milk. The change should be made gradually taking about two weeks to complete it. The amount of feed depends upon the size, strength and appetite of the calf. But don't guess at the amount of milk—have a graduated quart measure and then always measure. Overfeeding starts the calf wrong more often than any other cause. When you guess a large feed today and a small one tomorrow the calf does not thrive well. Just because milk is plentiful is no reason why the calf should be overfed, and it is never advisable to feed more than six quarts at a time, no matter how old the calf. The great difficulty in feeding calves is to prevent indigestion ,commonly known as scours. Many seem to think there is no danger of overfeeding on separator milk, as the butterfat has been removed. But this is a great mistake, as the protein has not been removed.

If a calf's bowels become too loose give, instead of the regular feed, a little more than a pint of wholemilk in which a raw egg has been beaten. Give this two or three times and then go back to half the regular feed and gradually increase if calf is in normal condition. The calf that is no in normal condition should never ge given a full feed of milk.

Observe the following simple rules: Never overfeed. Measure the milk each time. Feed immediately after separating, while the milk is still warm. Milk should be fed at the same temperature every day. Feeding cold milk one day and hot another will ruin a calf's digestion. Hot milk is never good for the calf's stomach. If necessary to warm the milk use a ther mometer and feed as near 100 degrees F. as possible. Feeding sour milk one day and sweet another will make a calf sick. Feed regularly and feed individually. If fed together some will get too much. Keep calf pails clean. This will make you extra work, but the healthy calf pays.

Do not feed grain mixed with milk, as it is gulped down without being chewed. Linseed meal and oats make a good ration.

The calf needs bulk for a healthy digestion, and will learn to eat a little fooder or hay when quite young.

SHEEP NEED WATER

Sheep, although not heavy drinkers, require their regular daily supply of water, and the caretaker should see that the spring or creek where they acquire it is kept open and easily accessible during cold winter weather. Some farmers say that sheep do not need water, an dwill live without it. They proved their words by their acts, and their flocks did not have water for weeks and months at a time during winter, unless a thaw set in.

The sheep ate snow, but that did not supply the needed water to quench the thirst. They lived, but how did they look? They were poor and half-starved looking, although well fed with both hay and grain. All that was needed t omake fine, sleek sheep of them was a box of salt, where it could always be accesible, and all the water they wnted. A less amount of grain and some water would have given better results. The body of the sheep requires the water to keep bowels and kidneys in active circulation, and when water is withheld those organs cannot perform their proper functions. Water helps to eliminate disease and promotes digestio;n without it the body suffers, the apetite flags, and a poor, straggling creature is the result.

Oh, yes, they live, but they are not a proft-maker, for their progeny is not sufficiently nourished before birth, and arrive weak and ailing. Some complain that salt gives the sheep the scours, but it will not if kept in goodly quantity before them all the time. Then they will not be so hungry for it ,and overeat. It increases the appetite and keeps them in prime condition when water is plentiful.—A. A. Drew.

Someone must stay at home to do the work of daughter, sister, maid.

To keep home sweet and clean, wouldn't you say she needs all the time-saving help that Gold Dust will surely give. These four *helps* particularly.

No. 1—Greaseless

Some articles collect more grease than others. For instance, roasting and frying pans, tops of stoves, dish towels. Busy housekeepers find that a tablespoonful of Gold Dust to half a pail of hot water makes the water soft for hands and wonderfully dissolving for grease.

No. 2—Gritless

There are many articles which require a *smooth* cleaner with no grittiness to mar glossy or polished surfaces. Such things as: silverware, windows, mirrors, wash bowls and all enamelled surfaces. Gold Dust is a smooth, gentle cleansing agent without grit. Remember—a tablespoonful to half a pail of hot w..ter.

No. 3—Rubless

Soap rubbed on a cloth cannot clean such things as: baby bottles, milk bottles, cruets, funnels, food choppers and all utensils with spouts. But Gold Dust dissolved in hot water makes a solution which dissolves every bit of oil or grease without the need for rubbing. Yes! A tablespoonful of Gold Dust to a gallon of hot water.

No. 4—Tasteless

Not even a trace of soap must be left behind when you clean the following:
Nooks and corners in ice boxes, dairy utensils, strainers, sieves and graters, patented articles such as grinding mills and egg beaters. Gold Dust thoroughly and effectively dissolves every tiny particle of oil or grease and washes out completely. Nothing but sweet cleanliness can remain.

MILK FROM UDDER THAT IS DISEASED

Milk from the udders of cows suffering from mastitis (comonly called caked bag, garget, etc.) should not be used for human food as some very troublesome diseases may arise from doing so, especially in children. Milk from udders or portions of udders so affected nearly always contain harmful bacteria which multiply with great rapidity when the milk is drawn, and these organisms may be responsible for nausea, vomiting and even diarrhoea in th consumer. Epedemics of septic sore throat in many instances have been traced to the milk supply having been contaminated by one or more cows in a herd which were suffering from mastitis. The pus present in milk from a mastitis udder may impart to the milk an unpleasant taste and the mlik may curdle and putrefy within a few hours after being drawn. If only one quarter of an udder is affected and a small top milking pail is used the milk from the healthy portions may be used. The diseased portion should then be milked into a separate vessel and boiled before being disposed of.—Wm. H. Feldman.

THE LAWRENCE-WILLIAMS COMPANY, Toronto, Ont.

THE HORSE

SPASMODIC COLIC

Probably the most common form of indiestion in horses is that form commonly known as "Spasmodic Colic." Some horses are particularly predisposed to it. It consists in a spasmodic contraction of a portion, or portions, of the muscular coat of the intestines, usually of the small intestine. It is not uncommon for the muscular fibres of the neckof the bladder to be involved.

Causes.—The disease is usually due to the nature of the food, or improper feeding, sudden changes of diet, exhaustion from overwork, particularly if associated with long fasting. A drink of cold water may cause it, especially if the horse be exhausted by a long journey or several hours hard work. Some horses are particularly predisposed, such as those in which there are concretions of different kinds in the intestines, abscesses in the mesentery, parasites in the intestines, ulcers in the stomach, canker or chronic thickening of the intestinal walls, also those with congenital or acquired weakness of the digestive powers or disease of the digestive glands.

While simple spasmodic colic is a comparatively unimportant disease, which readily yields to treatment in most cases, fatal cases have occurred, the patient dying from exhaustion, and a post mortem revealing no lesions or chronic disease of the digestive tract, the only abnormal conditions being a rigid contraction of small portions of the small intestine. Repeated attacks of colicky pains occurring in a horse without apparent cause, indicate some structural change in the digestive organs, in many cases the presence of concretions or tumors in the intestine. If such be present, and are movable, we are justified in assuming that they occasionally, by change of position, occlude the canal, and thereby check the backward passage of faecal matter, check peristaltic movement, and cause pain. In such cases the violent movements of the animal are liable to dislodge the obstruction, reopen the canal and consequently relieve pain. In other cases the obstruction does not become dislodged, the case does not yield to treatment, and after several hours, inflammation of the bowels results and causes death. A post mortem reveals the presence of a calculus or tumor.

A horse that is predisposed to colic from any cause will probably, sooner or later, suffer from an attack that will cause death. Some horses suffer from colic if allowed water shortly after a meal, others if given even a light change of food, others if fed certain foods, etc. When such is the case the attacks can usually be prevented by exercising care not to subject the animal to the conditions that cause the attacks.

Symptoms.—These usually appear suddenly and are very violent and alarming. The patient suddenly expresses pain by pawing, kicking at the abdomen, throwing himself down violently, rolling an dstruggling, jumping suddenly to his feet, probably repeating these actions, and, in other cases, shaking himself, then becoming quiet and commencing to eat as though nothing were wrong. After a variable interval of ease the pains recur, sometimes in an aggravated and sometimes in a modified form. During the attacks the pulse is full and frequent, but during the intervals of ease it is normal. The attacks may occur again and again, the periods of pain and of ease being of various duration, until the patient is relieved by treatment or spontaneous cure or the disease becomes complicated by inflammatory action, which complication usually terminates fatally. At the commencement of the attack faeces are often voided frequently and in small quantities and may be either soft or hard, while frequent voiding of small quantities of urine is often noticed. In other cases frequent but ineffectual attempts to urinate are noticed.

These symptoms indicate that the neck of the bladder is involved in the spasms, and as a consequence urine cannot be voided. This leads the uninitated to conclude that the horse is suffering from disease of the urinary organs. This idea is very common. The owner or driver decides that there is an obstruction in the urinary passage, and proceeds to remove it by giving a dose of sweet spirits of nitre. This is usually followed by relief but it does not act as it is generally supposed to. It will not remove obstructions, but it tends to relieve the spasm of the neck of the bladder, hence allows escape of urine, after which the horse iwll probably show no more pain. We often hear a man telling that his horse was very sick from "stoppage of his water," that he gave him a dose of sweet nitre, after which the animal urinated and then got all right. The fact is, the nitre relieved the spasm of the neck of the bladder, the horse became "all right"—and then urinated. If there be an occlusion of the urinary passage from other causes than that mentioned, the treatment named would make matters worse, because the drug, as well as being an anti-spasmodic, increases the activity of the kidneys, but does not remove obstruction; hence it causes an increased flow of urine into the bladder, but does not remove the obstruction that prevents its escape from the organ.

During the paroxysms of colic the pulse becomes altered, as stated, the respirations are also accelerated, and in some cases perspiration is profuse. During the intervals of ease these functions become normal. The symptoms, while usually short, are generally more violent and alarming than those of more serious intestinal diseases.

Treatment—In many cases a spontaneous cure takes place without treatment in from a few minutes to an hour or two, but it is wise to administer an anti-spasmodic in all cases. The following is a favorite and effective colic drench: 1½ fluid ozs. each of laudanum, tincture of belladonna, and sweet spirits of nitre, in a pint of cold water. This giving the dose for an ordinary sized horse, young, small, or very large animals require less or more according to size. Instead of this we may give 1 or 2 ozs. of chloral hydrate or 2 to 3 fluid drs. of chloroform in a pint of water. The patient should be placed in a roomy, comfortable box-stall or paddock, and carefully watched to prevent him from hurting himself or becoming fast. It is good practice to give a rectal injection of soapy, warm water. If relief be not apparent in an hour the dose should be repeated. If the first mentioned drench be used the laudanum must be omitted.

as it tends to constipation. After this the dose may be repeated every two hours as indicated by the symptoms. If relief be not noticed in at most four hours we may suspect a more serious condition than ordinary spasmodic colic, or that the disease has become complicated. When practicable, the services of a veterinarian should then be procured. If professional assistance is not available, the owner should repeat the doses as noted. If bloating occurs, the patient should be treated as for flatulent colic, a discussion of which will follow.

It is good practice to administer a laxative of 5 to 7 drs. of aloes and 2 drs. ginger or 1 to 1½ pts. of raw linseed oil after the acute symptoms have passed.—J. Hugo Reed, V. S.

FLATULENT COLIC

A disease commonly called "Flatulent Colic" is quite common in horses. It is a form of indigestion, and in the early stages the symptoms strongly simulate those in acute indigestion.

Causes.—This condition is much more serious than spasmodic colic although the causes are much the same, viz., changes of food or water, overfeeding (especially after a long fast or when overheated), food of poor quality, severe exercise too soon after a hearty meal, a weakness, or partial inactivity, of the digestive glands, etc., food that ferments readily, as green clover, turnip tops, etc., especially if wet or frosted is a fertile cause. It sometimes occurs during the progress of other diseases, indicating a very grave condition. This, and in fact, mostly all intestinal diseases, occasionally appear without recognizable cause, due, no doubt, to a non-active state of the digestive glands.

Symptoms.—The symptoms do not generally appear so suddenly, nor yet are they so violent and alarming to teh ordinary observer, as those of spasmodic colic. The animal becomes dull, uneasy, stamps his feet, probably kicks at his abdomen, looks around at his flanks, paws, lies down carefully, may roll, rise again and continue to show uneasiness. The pulse is increased ni both force and frequency and respiration is often more or less labored. The symptoms of pain are practically constant, but vary in intensity. In a short time after the first symptoms are shown there will be noticed a more or less well-marked fulness of the abdomen (bloating) more marked on the right side just in front of the point of the hip. The visible mucous membranes become injected, the pulse continues to increase in frequency, but usually gradually loses force, and the respiration will be labored in proportion to the degree of distention of the abdomen with gas. The extremities are usually cold, and there is often a twitching of the muscles. If relief be not effected, the symptoms continue to increase in severity, bloating becomes excessive, and death takes place from rupture of the intestine, suffocation or absorption of gases into the circulation.

Treatment.—Place in a roomy boxstall or a paddock. Agents which combine with, or neutralize, the gases are indicated. For this purpose there is probably nothing that can be safely given by the stomach that acts as well as oil of turpentine (commonly called spirits of turpentine) and raw linseed oil, 1 to 3 fluid ozs. of the former in one-half to one pint of the latter (according to the size of the patient). If necessary, the dose may be repeated in an hour, but if given the third time new milk should be substituted for the oil. When this medicine is not quickly obtainable 2 to 3 ozs. of bi-carbonate of soda (baking soda) dissolved in water should be given. The patient should be well bedded and kept as comfortable as possible. A couple of gallons of warm soapy water should be injected into the rectum occasionally. If the pain be severe it should be combatted by the administration of 1 to 2 ozs. of chloral hydrate dissolved in a little water, or 1½ fluid ozs. each of tincture of belladonna and sweet spirits of nitre in a pint of cold water as a drench. This anodyne may be repeated about every two hours as needed. If bloating becomes excessive, care should be taken to prevent the patient from throwing himself down violently, as there is danger of this causing rupture of the distended intestine. If the bloating becomes so marked that there is imminent danger of suffocation or rupture, the patient should be punctured on the right side at the most prominent part between the point of the hip and the last rib to allow the immediate escape of gas. This operation, if skilfully performed with a trocar and canula (an instrument especially designed for the purpose), has proved successful in most cases, but the use of knives and other crude instruments has not usually been followed by satisfactory results.

In a case of this nature when the administration of the drugs mentioned does not give relief in at most two hours, it is better, where possible, to secure the services of a veterinarian, but where this cannot be done the attendant can only follow the above treatment to the best of his ability.—J. Hugo Reed, V. S.

INTUSSUSCEPTION

Intussusception is a name given to a form of indigestion which is caused by a portion of the intestine (either small or large) slipping into the portion immediately behind it, like the drawing of a finger of a glove into itself. As a result of this, the normal course of the intestine is interrupted. In consequence nothing can pass through, the action in the bowel is checked and the circulation of the blood through the bowel involved is also checked. While this practically an incurable condition, it may be wise to draw attention to its occurrence and symptoms. Recovery of cases where this condition has been suspected has occurred, the imprisoned portion (if the condition really existed) having been released during the struggles of the animal, while other cases have recovered by a rapid sloughing of the imprisoned portion, and union taking place between the several ends, the sloughed portion passing off with the faeces.

Treatment, other than an operation, has no action in rectifying the trouble, and the veterinarian does not operate in such cases, as it is practically impossible to make a correct diagnosis or to exactly locate the lesion, and, though such were possible he cannot provide surroundings where antiseptic measures can be observed to a sufficient degree to afford probable favorable results.

Symptoms cannot be said to be diagnostic, but are a combination of those observed in other diseases of the di-

(Continued on page 124)

Horsemen Attention !

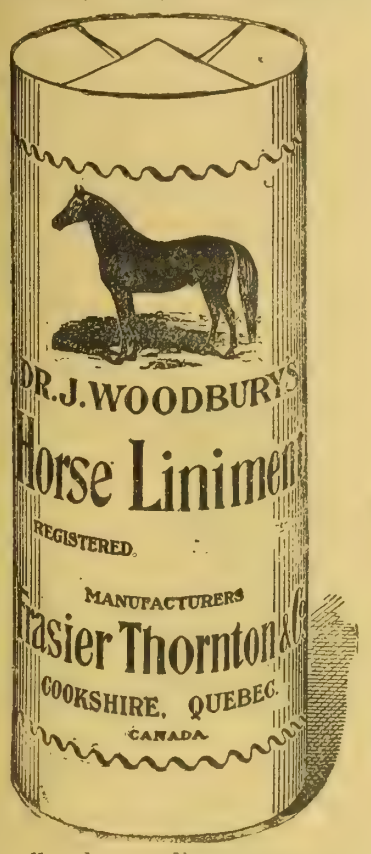
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsement of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

FOR SALE ALL DEALERS

PRICE 35 CENTS



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

CEMENT AND WOODEN HEN HOUSE FLOORS

Poutry-house floors are usually made of either earth, wood, or cement. Where the soil is light and well drained the use of earth floors give economy in construction and investment, and a more comfortable house. Where the drainage is not good, and on heavy soils, especially those containing much clay, floors of wood or cement are generally preferred.

Each kind of floor has its advantages and disadvantages, consideration of which will often lead a poultry keeper to use a different kind of floor from that most generally constructed in his locality.

Earth Floors

A floor of earth needs to be renewed at least once a year. If the droppings that fall upon the floor are carefully removed at frequent, regular intervals, much of the earth is removed with them. If the regular cleaning of the floor is superficial, the earth of the floor to a depth of several inches becomes so mixed with droppings that its condition is very insanitary.

When the poultry keeper has a garden, the manure obtained by removing the earth floor of the poultry house will compensate for the labor of renewing the floor, and the new earth required can be taken from a convenient spot on his own land. When the poultry keeper must pay some one else to take away the old earth and bring in new, the cost will in a few years exceed the cost of a cement floor.

Cement Floors

The principal fault of a cement floor is that it is likely to be cold and damp. These conditions may be corrected by covering the floor to a depth of an inch or two with dry earth or sand, using over this scratching litter of straw or wood shavings. Floors so treated require as much routine work to keep them in good order as earth floors, but the supply of clean earth required is much less and the work of annual renovation is eliminated.

Floors of wood are not now much used in poultry houses except when the space under the floor is high enough to be occupied by poultry. A wooden floor close to the ground soon rots, while any space under a floor not high enough to be used for poultry makes a harbor for rats and other vermin.

The wooden floor of a poultry house should have a light coating of dry earth, sand, chaff, or similar material to prevent the droppings of the birds from sticking to and saturating the boards.

Real Home Made Pie—

Canada Food Board Flour Mill License No. 10.

Yes, Ma'am!
Real homemade Pie!

With top and under crust that truly melt in your mouth—and a generous filling of your own delicious homemade preserves or home-grown fruit.

That's a pie worth eating, and worthy of your baking, and it's the kind of pie you can make every time with

BEAVER FLOUR

MILLED OF BLENDED WHEAT

"Beaver" Flour equals any of the "special pastry flours" because it is, in itself, a special pastry flour—being the choicest Ontario fall wheat, blended with western spring wheat to give it strength.

This is why Pies, Cakes, Cookies, Tarts, Doughnuts, Buns and Fancy Pastry —when made with "Beaver" Flour—are so light, so flaky, so uniformly good.

This is also why the Bread and Rolls—made with "Beaver" Flour—have a delicate, nutlike flavour that is totally lacking in western spring wheat flours.

Just try "Beaver" Flour for anything you are baking—and see what happy results you get, every time.

FOOD AND FEEDING

More food is needed by hens in wet weather than in dry, and in cold than in hot. In wet and cold weather combined more still is required. Give plenty, but not too much.

When food is left lying about it gets dirtied and entices sparrows, mice and other vermin.

If the hens are in good condition for laying, they will thrive much better if compelled to come off the roost in the morning and scratch for their breakfast than if they walk up to a feed trough and fill their crops.

Excessive feeding of middlings is apt to produce small-sized eggs. This, no doubt, si caused by the fact that middlings generally increases egg production.

The feeding question is one which each individual poultry raiser must largely decide for himself.

Until the fowls get used to it, new corn should be fed sparingly. Too much will prove disastrous.

Feed at regular hours. Irregular feeding frequently causes derangement of the digestive organs, resulting in impaired health and fewer eggs.

Very little barley is fed to poultry in this country, although it is a splendid food, and should be more largely used in making up a balanced ration.

Eggs are made from the food consumed by the hens, and unless they are supplied with foods containing the elements that enter into the formation of the eggs, the supply will be very limited. The food must be clean, sound and wholesome, and the water pure, and fresh.

Vigorous exercise is quite as important as proper food.

A liberal amount of wheat bran should always be used in the mash for bulk, and gradually decreased with a larger amount of cornmeal as the time for marketing approaches.

Barley, either whole or ground, is very good. It has rather too much hull, but otherwise it is a satisfactory food. It is considered by many to be next to wheat in point of value.

ROUP IN TURKEY

Roup is one of the most fatal diseases pertaining to fowls. When this disease is found, the affected birds should be killed at once and burned or the well ones taken away to other quarters, otherwise the entire flock is in danger.

The symptoms, at first, are like those of severe catarrh, but the discharge from the nostrils is thick, opaque, and of a peculiar and offensive odor. Froth appears at the inner corners of the eyes, the lids swell, and often the eyes are entirely closed; the sides of the face become much swollen, and the bird rapidly loses strength and dies.

The fowls must have warm, dry quarters, and soft, stimulating food. As soon as possible give a small fowl a teaspoonful, or a large one a tablespoonful, of castor oil. The nostrils should be syringed, by inserting a small syringe in the slit of the roof of the mouth, with one part of chloride of soda to two parts of water. Three or four hours after the oil has been given, having divided the following into thirty doses, give one, two or three times a day:

One-half ounce balsam copaiba.
One-quarter ounce liquorice powder.
One-half drachm piperine.

Enclose each dose in a little gelatine, and administer as directed. If the fowl continues to get worse, kill at once and burn the carcass.

SALT FOR POULTRY

No dairyman would think of letting his cattle go without a regular supply of salt, but few poultry breeders give their flocks any salt, let alone a regular supply. If salt is needed by cattle it will help hens.

For fowls the finer grades of salt such as table or dairy salt sold for large animals is likely to give some individul bird too much. When moist mash is fed the salt may be mixed with it. about a tablespoonful to each large bucket—fourteen quarts—of mash. When dry mash is fed the salt may be mixed with the meal. using a heaping cup of mash. In adding the salt, sprinkle it evenly over the meal and then mix thoroughly. It is, of course, necessary to use judgment as to the quantity of salt needed. as a great deal depends upon the strength of the salt and what other feeds are fed; some beef scrap, for instance, is very salty, thus less salt would be required in the mash.

Fowls. unlike cattle. cannot be allowed a salt supply to eat at will. as they will invariably eat such quantities as to cause salt poisoning and death.

WHITE DIARRHOEA AMONG POULTRY

I have lost quite a number of hens. they sit around and won't eat, then die. Their excrements are white and green. H. W.

There is no known method of treat-

ing poultry affected with white diarrhoea. To keep the disease out of the flock one should never set eggs from hens that had white diarrhoea when they were chicks. Eggs for setting should not be sold fro ma flock where this disease has been present during the former season. Several remedies have been recommended but cases of guaranteed cures have not been reported. Care should be taken to isolate the sickly looking birds from the healthier ones and eliminate the possibility of infection.

The use of sour milk has beeen found very beneficial. Clean all the coops, feeding troughs and youltry house fittings, and then thoroughly spray with chloride of lime dissolved in water.

REMEDY FOR FEATHER PULLING

Temptation to start feather pulling is frequently furnished by some few hens or chicks, who, not having feathered up so quickly as the others, expose numerous juicy quills that attract the idle ones. If the flock is closely watched at such times, and means are taken to stop the habit at its beginning, little trouble need result. Any fowls that show signs of having had feathers plucked should be caught and the surfaces of exposed quills greased with lard mixed with extract of aloes in the proportion of one teaspoonful of extract of aloes to a cup of lard. Birds picking at surfaces thus treated do not find the taste to their liking and rarely try it more than once.

TEST YOUR THERMOMETER

It is not an uncommon occurrence for a nentire setting of eggs to be ruined because of a faulty thermometer. While fairly accurate the average incubator thermometer is not a high-grade instrument and is very apt to register incorrectly after a season or so of service. To test the instrument it is necessary to procure a good thermometer for comparative readings.

Fill some small vessel with luke warm water and immerse both instruments in it, moving them slowly about all the time. Remove from the water in about a minute's time and compare readings. If there is a difference of not more than half a degree the error can be noted and the thermometer returned to the incubator. If the variation is greater the best plan will be to purchase a new instrument. Both old and new thermometers should be tested before the incubators are started.

LIVER TROUBLLE OR TUBECULOSIS

"Would like to know what is the matter with my young fowl. When I kill one I find yellow spots on the liver. Are they good to eat? They look fine and their combs seem to be in good condition. I bought eggs from different stock for hatching last spring and sold off all my old hens thinking that perhaps I would get rid of these troubles in that way, but the young ones have the same trouble. Please tell me what to do about it."

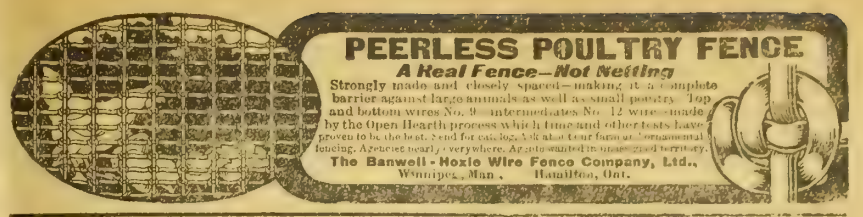
The yellow spots which you find on the livers of your chickens may indicate simply liver trouble, or if the spots extend into the liver forming hard, yellowish bunches, it is likely to indicate tuberculosis. If it is tuberculosis, merely killing the hens last spring and allowing the chickens to run on the disinfected ground would not be much protection against the disease. If it is tuberculosis the chickens are not fit to eat, but if it is simply liver thouble there will be no danger in eating them, though we would not want to eat the liver, and it would not be advisable to sell any on the market. Tuberculosis reduces the flesh of the fowls sooner or later and that may be taken as the proof in this case. Your best plan is to get rid of the whole flock. Plow the poultry yard, clean and disinfect all houses, coops, roosts and feeding troughs, then lime wash and start anew in the spring time with hatchings taken from assured flocks free from liver cr tubercular diseases.

BUMBLE FOOT AMONG POULTRY

What will cure bumble foot that has appeared amongst my hens? Are they fit to eat?

Mumble foot is another name for abscess of the foot and it can be cured as a local abscess anywhere would be cured, that is by freely opening it with a clean blade and allowing it to drain and heal. Not all cases of bumble foot need treatment, as they seem to give the fowl little inconvenience, and the others may be so deeply seated as to require more surgical interference and subsequent care than the fowl is worth. If the fowl is in good health otherwise, ther eis no reason why it sould not be eaten.

I know of nothing to do for the case of "leg weakness" except to place the affected fowl in comfortable quarters and feeed her lightly until recovery or it is seen that she probably will not recover. While the cause of this condition is obscure, it will be perfectly rational treatment to administer a physic and repeat once or twice if you care to repeat the trouble with the bird. A half-grain tablet of calomel, followed in an hour or two by a teaspoonful or more of castor oil will be good "on general principles."



PEERLESS POULTRY FENCE
A Real Fence—Not Netting

HENS WITH BLACK COMBS ARE DYING

Some of my hens stand around, are dull for a few days then die. Their combs get black. What is the cause and give a cure.

Enlarged liver due to overfeeding of rich food and lack of green food, is probably what your fowls are suffering from. The best thing for you to do is to remove the causes, that is, give them an entire change of feed, plenty of freedom, fresh air, dry quarters, grit, pure water, skimmilk, plenty of green feed, and change your mash and grain feed. There is no medicine that will help.

October and November are the months of great egg scarcity. This is because the layers need all their vital energy to complete the moult and are resting from egg production then. Pullets are just beginning to lay if well matured. At this season eggs should command the highest market price. Our advice is to feed liberally during the moulting crisis and provide everything needed for the comfort and health of the flock.

WOMEN'S INSTITUTE SECTION

This section of the Maritime Farmer will be devoted to the interests of the Women's Institutes of New Brunswick. We respectfully solicit contributions from all branches, touching upon matters of general interest. We wish the members of all branches of the Women's Institute to feel that the Maritime Farmer wishes to fully assist them. The Maritime Farmer is the official organ of the Women's Institute of New Brunswick. We would suggest that YOUR BRANCH name a press committee, so that news from YOUR BRANCH may reach other branches.

It was only a glad "Good Morning"
As she passed along the way,
But it spread the morning's glory
Over the livelong day.

SADIE GOES TO HEAVEN

(By Diana Burnet)

I take it that heaven is a necessary hypothesis of all religions. I have heard of religions that could do without hell, but never one that could afford to give up heaven. Exactly what kind of a heaven was prescribed for little Sadie Bernowitz I am not sure. I suspect that it was quite different from my own type of heaven, and am rather sorry for that. I think that we would all do well to share the same heaven, inasmuch as we are compelled to share the same world. But I dare say the idea is too conservative to appeal to most human beings.

Sadie Bernowitz is a friend of mine; this despite a certain discrepancy in our ages—and our hereafters. I met her in West Brodaway one Sunday afternoon in October. She was sliding down a highly polished door-step, and as I passed along the sidewalk she struck me fairly in the chest. There were mutual apologies and explanations and we became acquainted.

"I have six teeth and a lame dog," said Sadie, by way of introductory conversation. I replied that I had nothing but an old silver quarter, which for the life of me I could not get spent. So we adjourned to a dejected looking drug store, where Sadie consumed a pale pink something that I trust was ice-cream. The lame dog whose name was George Washington Square, sat near by and trembled ecstatically at every mouthful that Sadie took. I have seldom seen such disinterested affection. Nor was Sadie lacking in reciprocal devotion. Instead of devouring to the last crumb the shrinking small cake that accompanied her order, she deliberately broke it in two and gave half to George Washington Suarqe, who was like to die of happiness.

"Do they have dogs in heaven?" asked Sadie with a fond glance at her chance treasure.

I replied that it was a delicate question, which had not yet been fully decided.

"You can bring 'em in a drug-store," observed Sadie hopefully.

"Quite true," I replied. "But heaven may be somewhat more restricted.

"I'd like to go to heaven," said Sadie, in the enthralled tone of the prospective traveller. "But I wouldn't go unless I could bring George Washington Square."

From the contemplation of such high ethical issues we turned to matters more temporal. I learned that Sadie was the eldest of five children whom fate had visited on Herman Bernowitz, a merchant peddler of the neighborhood, and his wife Rebecca. It was not particularly an intelligent distribution of infant life, for the Bernowitz home consisted of only two rooms and a fire-escape. But since the question of human birth is clearly the Almighty's business, we will not dwell too long upon it here. Only the Almighty (and possibly Mrs. Bernowitz) knows how many times seven goes into two.

Mrs. Bernowitz was a large billowing woman who scrubbed floors from five to eight every morning, and from five to seven every evening. The rest of the day she spent in solving the problem of seven into two. Consequently there was little time for that esthetic practice known as "beautifying the home." One of the great disadvantages of poverty is that it produces ugliness, which is another name for hell. But if we go a step further we perceive that poverty may also produce an interest in heaven. Sadie Bernowitz, for instance, was passionately interested in heaven. She wanted to go there, in precisely the same way that an artist wants to go to Spain. It was this desire that led her into the adventure of the eleemosynary hamper.

In order to explain the hamper it will be necessary to point out that West Broadway is, in a sense, the continuation of Fifth Avenue. This coincidence, which is more ethical than geographical, had impressed itself deeply upo nthe social consciousness of a certain great lady whose name I shall not mention. The mere fact that she possessed a social consciousness is sufficient to denote her high station. Only the most fashionable ladies can afford to have a social consciousness.

The great lady in question had felt the responsibility of West Broadway very keenly. She had entered into an arrangement with the local Rescue Mission whereby the poor of that vicinity should be provided with the discarded raiment of Fifth Avenue. It was a very beautiful arrangement.

Regularly, then, from week to week, there appeared at the Mission a large hamper whose advent was the chief excitement of the neighborhood. Crowds gathered to see it unloaded from the great lady's motor, and to cheer the two men in purple who carried it into the Mission. The two men in purple were exquisite in their parts. They bore the hamper with solemn groans, and just the right amount of disdain in their eyes. It is hard to say whether West Broadway was more interested in the Hamper per se, or as a sort of spectacle. Especially enjoyable to the onlookers was the exquisite disdain of the two men in purple.

To Sadie Bernowitz the event thus described was but proof positive of the existence of a diviner universe. She had made up her mind long since that the hamper came from heaven, which belief she had confided to George Washington Square. "Those men are angels," she had said, pointing to the dignitaries in purple, "and that"—indicating the motor—"is God's delivery wagon."

It was on a morning late in October that little Sadie met the hamper, so to speak, in confidential circumstances. The huge wicker receptacle was standing empty in the narrow, dark hall of the Mission, awaiting the two men in purple, its lock unfastened, its straps hanging loosely at its sides. Immediately Sadie felt herself to be confronted by unusual oportunity. Her heart began to beat very fast. She darted into the little hall, dragging George Washington Square after her.

There she hesitated, half expecting the hamper to give forth some hollow alarm. But no sound issued from the sacred trunk. Sadie crept forward, grasped the lid, opened it. Five seconds later a very frightened, but determined girl and a very astonished but trustful lame dog were seated side by side in the hamper, with the top pulled down over their heads and the world quite shut away.

Scarcely had they arranged themselves with comfort when the honk of a motor-car was heard just outside the Mission door.

"It's the angels," thought Sadie, and hugged George Washinkton Square the more tightly . Through a chink in the wicker she saw two pairs of purple trouser-legs enter the hall. Then she heard masculine voices fraught with disdain.

"Take 'old, Enry," said the lrst angel "an' we'll 'eave the ole barsket into the car."

"Take 'old yourself," retorted the second angel. "D'y' think I'm a bloomin' hexpressman?"

There was a brief pause, devoted, upon the part of the angels, to divers preparatory groans; then Sadie felt herself lifted bodily into midair.

"Seems 'eavier than usual," remarked the first angel.

"Wot is it is?" replied the second. "Wot if it is? Oo are we to know 'eavy from light? Get the bloomin' barsket 'ome, that's what I s'y!"

Followed more angelic groans, and finally a definite conclusive bump as the Hamper was tossed into the car. Shortly thereafter the motor began to whir, and the celestial chariot moved forward toward its exalted destination.

"We're goin' to heaven, George Washington Square," cried Sadie as she crouched upon the floor of the hamper. "That's where we're goin'." George Washington Square gave a short bark of pleasure and licked his mistress's face in token of eternal fealty.

The journey was not a long one—was far shorter, indeed, than the ordinary human would have supposed. The car stopped; the angels seized upon the hmper, bore it off with further gruntings, nd deposited it at last in a Place of Darkness.

Sadie waited until she was quite sure that they had gone and then cautiously raised the cover of the hamper. There was a sort of twilight all about her. Peering out, she found that she was in a cavernous chamber of receding walls and crawling pipes that led to an upright cylindrical contrivance of sinister aspect. This contrivanace, terrible to relate, was aglow with red-hot coals, and gave off a noticeable heat. Moreover one could see through the open mouth of it sulfurous flames leaping fantastic. For one awful instant little Sadie thought that she had gone to the wrong place, that all was lost. But suddenly, at the far end of the room she perceived a flight of stairs lifting hopefully upward, and her optimism returned.

"I always knew there would be stairs!" said Sadie, and taking George Washington Square in her arms, she made for the celestial ascent.

At the top, very naturally, was a door, which she opened. A narrow passageway confronted her. She crept through it on tiptoe, until she came to another door flanked by a remarkable flowered screen—

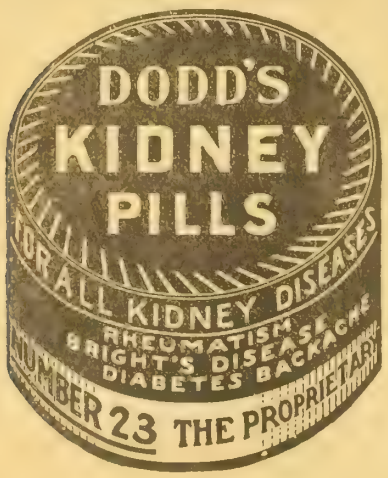
"Oh!" exclaimed Sadie. "Oh! oh; We're here!"

A room more vast than any earthly room need possibly have been, lay before her. From its ceiling depended a gigantic cluster of—could they have been icicles?—and upon its walls were hung wonderous draperies, with strange pictures woven into their hearts. The Bernowitz apartment, even including the fire-escape, would have fitted into this one room thric over. But who are we to draw comparisons between heaven and earth?

In the centre of the room stood a lustrous table, and upon the table was a silver dish, filled to overflowing with beautiful fruits: red apples, yellow bananas, golden oranges, huge bunches of purple grapes. Sadie walked slowly forward and selected an apple from the dish. Then she looked at George Washington Square, who wagged his tail encouragingly. So Sadie began to eat the apple.

It was not until she had reached the last few mouthfuls that she perceived the embarrassment of her choice. What should she do with the core? Obviously she could not put it back into the dish, and one of the disadvantages of heaven seemed to be a total lack of rubbish heaps.

At this critical moment the sound of



Knit Socks and Dollars with the Auto Knitter

Profitable employment at home in war or peace time

Socks—more socks—the Soldiers' call! The hosiery industry is booming and the demand far exceeds the supply. Help us fill it but get away from slow hand knitting. Use the fast, reliable, modern Auto Knitter. We gladly take all the socks you wish to send us and pay you highly profitable prices.

The Auto Knitter is simple and easily learnt—and secures a big income for full or spare time work right in your own home and no previous experience is essential.

Write today for full particulars enclosing 3c stamp. See what good money you and your family can earn at home besides doing patriotic work.

footsteps fell upon her ears. She glanced despairingly about the immaculate room and then popped the apple core into the faithful jaws of George Washington Square.

"You've et oilcloth and baseballs," whispered Sadie apoletically, and turned to see a gorgeous man-creature regarding her from the opposite end of the chamber.

He was very evidently an angel, and rather a high type of angel, too. One saw at a glance that he outranked the two men in purple. He had on the tallest white collar that ever persecuted saintly chin. His coat, moreover, was of awesome pattern. It began with a single button high up on his bellying chest, and ended in a long backward sweep that reached almost to his heels.

Suddenly the stout angel opened its mouth and looking straight at Sadie, said: "How do I know you're real? It might be the brandy I took for breakfast!"

He shut his eyes very tight, opened them very wide, and then thrusting his head forward like a turtle, stared at the small intruder.

"Who are you?" asked the angel. "And where do you come from?"

"I'm Sadie Bernowitz," replied the child, "and I come from Washington Square South. Do you allow dogs?"

"Dogs" said the other, loosening his collar with a fat finger. "Dogs! Lord bless you, yes! Nothing but dogs!"

"Then I'll stay forever and ever," declared Sadie, firmly.

The stout angel passed his hand acros his brow. "I'd better be calling one o' the maids," he muttered. "'Tis no matter for a man to trifle with."

He disappeared, mumbling imprecations against the brandy. Sadie stood gazing anxiously after him. Suppose they took dogs exclusively, and did not take people? She decided to say that she had been invited.

A female angel dressed all in white, came abruptly into the room, saw Sadie and George Washington Square and stopped short.

"The Saints preserve us!" said she. "What are ye doin' here, little girl?"

"I've come to stay," replied Sadie, and added boldly, "I was asked!"

The white angel seemed nonplused. Then a faint light glimmered upon her not too intelligent countenance.

"Sure, ye must be one of the ma'am's fancies," she said. "Come into the reception room, Miss, and I'll call the housekeeper."

So Sadie followed the white angel into another great chamber, and she sat upon a couch that felt as soft as clouds, while George Washington Square rolled joyously upon the thick rug at her feet.

Soon a third angel appeared, a very grand silken angel who rustled as she walked, and who look appraisingly at Sadie through a pair of gold rimmed eye glasses.

"You will need a bath," she said decisively. "And some new clothes. I really should have been told that you were coming. Good gracious! What animal is that?"

Her horrified glance had fallen upon George Washington Square, who yawned to conceal his embarrassment. Sadie rose to her pet's defense.

"He isn't an animal," said Sadie he's a dog."

"Indeed!"

"He's allowed here, too," continued Sadie, who was determined to stand upon her rights.

"Dear, dear," said the silken angel, "I really should have been told."

Then the silken angel summoned the stout man angel and gave him a number of instructions to which he responded by swaying bacward and forward in a sort of stiff unjointed bow. The man angel could not bend at the waist because if his stomach, which was distinctly in theway; nor could he nod his head because of the high collar. So he bowed all over, as it were, and waddled ponderously away.

After which the silken angel and Sadie and George Washington Square went through a wilderness of rooms until they came to a door in the wall. This door the angel opened, disclosing a large cupboard fitted with plush seats and two full-length mirors. Into the cupboard they got, all three, and the angel pushed a button, whereupon the cupboard began slowly to ascend. Sadie held her breath and clutched George Washington Square's ears for moral support. Were there heavens upon heavens?

They had risen but a short distance, however, when the angel pushed another button; the cupboard stopped, the door slid back, and they emerged upon a new plane of adventure.

"I suppose that I had better give you the pink room," said the silken angel, in her brisk way. "This way, child."

It was inevitable, perhaps, that heaven sould contain a pink room, but it was no less miraculous for that. Little Sadie stood entranced up the threshold.

"Oh," she cried, "isn't it beautiful!"

"It ought to be," said the angel briskly, it was done by Baumgarten."

Ten minutes later Sadie was sitting in a dazzling white bathtub. She thought it a wonderful sensation. Never before had she looked upon ablutionary exercise as a pleasure. Now, however, it seemed a positive delight. The idea of devoting an entire room to one's personal cleanliness was so extravagant as to appeal to her feminine nature. She decided, wisely enough, that heaven was simply a place where on e found happiness in old experience.

When she had been scrubbed from head to toe, and sprayed with an ineffable warm spray, and dried with a voluminous soft towel, the silken angel wrapped her in a snow-white sheet and put her to bed.

"I've ordered some new clothes for you," said the angel. "Of course you can't wear the old ones. They're hardly sanitary."

"Yes, ma'am," said Sadie, who hardly dared breath lest she be whirled out of this amazing realm of illusion.

The silken angel rustled away, and Sadie sat very stiff and straight among her pillows, awaiting fresh wonders. She had not waited long when the white angel appeared with a small trayful of steaming and savory dishes. At the same time a divine aroma permeated the pink room, so that George Washington Square became tremulous with emotion, and performed his one trick, which was to lie down and roll over as furiously as possible.

"Is this all mine?" asked Sadie, gazing wide-eyed at the tray, which the white anagel had deposited at her bedside.

"Yes, Miss. But ye can leave what ye don't want."

"Oh," said Sadie hastily, "I won't leave anything."

With which heroic announcement she advanced to the attack, ably seconded by George Washington Square, who stood upon his hind legs and begged for titbits. And if he so far forgot himself as to snatch a morsel or two from the tray, what then? A dog that has been accustomed to dine on baseballs can not be expected to retain his manners in the presence of such heavenly delicacies.

When the last crumb had disappeared, little Sadie lay back in her pillows with a contented sigh. She felt warm, and comfortable and deliciously drowsy. So she closed her eyes, just for a moment.

She was awakened by the sound of a brisk, firm voice, and looking up, saw the silken anagel bending over her. Upon a chair nearby reposed a bewildering heap of packages.

"Your clothes have come," said the angel.

"Oh," exclaimed Sadie, and flinging aside the covers, leaped out of bed.

The angel smiled and began to untie the packages, and in a short time Sadie was transformed from a small tatterdemalion of the slums to something approaching divinity. So complete was the change, indeed, that George Washington Square grew apprehensive, and crawled under the bed to ruminate upon the alterations.

"We'll go dow nnow," said the silken angel.

Taking Sadie's hand, she led the child down a broad stairway of highly polished wood, and into one of those tremendous rooms of which heaven seemed to be composed. At the far end of this room sat a woman, drinking tea. Beside her the stout man angel bent at great risk above a silver kettle, and upon three cushions at her feet sat three dogs, of a diminutive fluffy white breed. It was apparent that she was a very great personage—probably the queen of heaven.

"Whatever you do," whispered the silken angel, as she and Sadie entered the reception chamber, "don't forget to admire the dogs!"

Then the silken angel dropped Sadie's hand, and hurrying forward, spoke a few words to the queen of heaven. The latter raised her imperial head, and frowned impatiently.

"But, my dear Higgins," she said, "I have taken no child from the slums."

The poor practical angel fell back a step and pressed her hands to her bosom.

"Could there be a mistake?" she gasped.

"I think it quite likely," replied the queen, in a weary voice, and tossed a tea cake to one of the dogs.

"I'm very sorry," stammered the angel. "I will send the child home at once."

"Wait," said the queen. "She seems to be rather a pretty child. I had no idea the poor dressed their children so nicely. Come here, little girl."

Sadie approached with diffident steps yet sustained by the thought of her pink sash and shiing slippers.

"What is your name?" asked the queen.

"Sadie Berrowitz," was the faint reply.

WAS WEAK
ALL RUN DOWN
FROM HEART and NERVES.

Mrs. Percy G. McLaughlin, Lawrence Station, N.B., writes:—"I am writing to tell you that I have used Milburn's Heart and Nerve Pills, and find since I commenced to use them that I feel altogether a different woman. I was weak and run down from my heart and nerves, and was recommended to try your pills by Mr. James H. Scott who has taken them, and says if it were not for them he could not live. When I finish the box I am now taking I will be completely cured. I wish to thank you for putting up such a wonderful medicine, and I will gladly recommend it to one and all."

To all those who suffer in any way from their heart or nerves, Milburn's Heart and Nerve Pills will come as a great boon. They strengthen and stimulate the weak heart to pump pure, rich, red blood to all parts of the body, strengthen the shattered nerves, and bring a feeling of contentment over the whole body.

Price 50c. a box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

A MESSAGE TO WOMEN!!

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:
Mrs. M. Summers, Box 309 Windsor, Ont.

WIFE'S COLD
Husband's Bronchitis
CURED BY
DR. WOOD'S
NORWAY PINE SYRUP.

Mrs. James Mack, Trenton, Ont., writes:—"I suffered for several months with a bad cold. Some friends told me about Dr. Wood's Norway Pine Syrup, and of the benefit it was to them. Before I had used two bottles I could get some rest, which I could not do before. I had tried everything, but "Dr. Wood's" was the only thing that gave me any relief.

My husband suffered terribly from bronchitis, and did not know whether he was going to recover or not. At my druggist's, Mr. J. H. Dickey, I was advised to try your syrup, which I did, and am so thankful that I cannot recommend it highly enough."

Many people on the first sign of the slight cold or cough neglect it, thinking, perhaps, it will disappear in a day or two, but the longer it is let run the worse it gets until it settles on the lungs and serious results ensue.

On the first sign of a cough or cold, get rid of it before it gets settled. Take a few doses of Dr. Wood's Norway Pine Syrup and see how quickly it will disappear.

This sterling remedy has been on the market for the past 30 years, and stands head and shoulders over all other cough remedies.

Put up in a yellow wrapper; three pine trees the trade mark; price 25c. and 50c. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

"That is very dreadful," observed the queen. "But doubtless it can be changed. How did you get here?"

"I came in the hamper," said Sadie simply.

"The hamper!" exclaimed the queen and the angel in person.

Sadie nodded; and then feeling that it was high time to change the subject, remarked that she was very fond of dogs.

Immediately the queen sat upright in her chair. A gracious smile overspread he rfeatures. She looked brightly at the silken angel.

"Really," she said, "it might not be a bad idea to have her stay? What do you think?"

"I think that it would be very kind of you to keep her," replied the angel."

"Yes," said the queen, "and she would be such good company for the Poms. I have often thought that the poor dears needed a young person about the house—"

Suddenly she broke off, uttered a piercing shriek.

"Mercy on us!" cried the queen. "What is that?"

Sadie and the silken angel turned. The three Poms began to bark furiously. The stout man angel, who had been all this time bending over the kettle, straightened up so abruptly that he burst the button off his coat.

Through the door of the tea room of heaven came a yellow dog that limped as he walked. His tail was wagging in a pathetic attempt at friendliness. His whole attitude was one of humble apology. When he perceived the furore that his entrance had caused, he stopped and performed his one trick. After which he arose and looked at Sadie Bernowitz with an expression of love agonized by doubt.

"Oh, George Washington Square," cried Sadie. "I'd forgotten all about you." And catching the impossible canine up in her arms, she hugged him to her breast, regardless of the beautiful new dress.

The queen meanwhile had succeeded in quieting the Poms, who, one by one, turned their backs upon the plebian intruder.

"Hodgson!" said the queen.

The angel man stepped forward.

"Yes, Madam."

"Take that hideous little beast out of my sight! Have it removed at once from the house!"

"Very good, Madam."

But Sadie took a fresh grip on George Washington Square, and faced the advancing angel with flashing eyes.

"I won't let you touch him!" she cried. "I won't, I won't."

At this point the silken angel attempted to intervene. "Perhaps if I could talk to her—"she began, but the queen made a commanding gesture.

"Stop!" she said. "We will let the child decide. Little girl," she went on, turning to Sadie, "you may stay here if you wish to—but only on condition that you give up that dreadful dog!"

For a moment Sadie hesitated. A vision of the pink room passed her eyes. She thought of the bath and the luncheon and the new clithes. And then she thought of George Washington Square, lying warm and trustful in her arms, and the hot blood surged into her cheeks. She took three steps forward and looked boldly into the queen's eyes.

"I wouldn't give up George Washington Square," she said, in a low quiverin gvoice, "for all the heavens that ever was!"

There was a brief, tense silence. Then the queen spoke, in a tone of unfathomable ennui.

"Hodgson!"

"Yes, Madam."

"Order the motor at once, and have this child taken home."

"Very good, Madam."

The stout man angel bowed his peculiar bow, and departed. The queen sakn back into her chair. A weary sigh escaped her delicate lips.

"The ingratitude of the poor," she said, "is really too discouraging. I don't know what the world is coming to."

A few days later I met Sadie in her native habitat. She was sliding pensively down the doorstep railing, with George Washingto nSquare tucked under her arm.

"I have been to heaven," she said, as soon as we had exchanged greetings. "It wasn't so much. I would rather have an ice-cream soda."

She paused and looked down at George Washington Square.

"You can bring all kinds of dogs in a drug store," she said softly.

Hours afterwards I found myself still cogitating Sadie's bit of philosophy; and the more I cogitated the more I perceived that it was nothing but ridiculius sentimentalism. That is the great trouble with the poor. They are sentimental. They permit themselves to be enslaved by their emotions.

The rich are wiser. They do not have emotions.

RHEUMATISM
Needs Strong Medicine Decided Syracuse Man Who Suffered 36 Years Before, at Last He Found a Cure
WILL SEND FREE TO ALL WHO SUFFER

"You can't cure Rheumatism with linaments, cheap uric acid solvents, starving, sweating or dosing your stomach with drugs that either ruin the digestion or are so weak they do little more than scratch the surface of the disease," says F. H. Delano of Syracuse, N. Y. Rheumatism is deep-seated, hard to shake off for good as everyone who suffers from it knows, and it needs medicine which, while harmless to the stomach, is strong enough to take right hold to do any permanent good.

Mr. Delano who suffered from all the torturing, twisting pains of rheumatism for 36 years, found at last, a strong but harmless medicine compound that cured him. As he took it, all those years of accumulated soreness, pain and stiffness just seemed to melt away and vanish. THIS REMEDY IS WORTH TRYING. If you suffer from rheumatism, let Mr. F. H. Delano send you a generous package of his great medicine FREE. Don't send any money. He wants to give a package free to every one who needs it. Don't suffer another day from rheumatism if this package will end it, but write at once to F. H. Delano, 787-D, Syracuse, N. Y., and get your package right away. Because of the great expense, not more than one free package can be sent to an address.

Note: Orders for Delano's Rheumatic Conqueror will be filled from their Canadian Laboratories without duty.

THE PROPER CARE DUE THE CHILD ATTENDING SCHOOL

The work in the fields and in the farm home has gone on during the summer in regular routine. The children have helped at every turn, for there are tasks on every farm to suit boys and girls of all ages.

But when the children are in school they must be released from a greater part of their work. It is the parents duty to send them off to school as comfortable and hapy as possible.

The garments must be kept ready for use, also handkerchiefs, overshoes, storm coats and umbrellas. Wet feet and damp clothing bring aches and colds, and the latter may be passed to every child in school. The mothers should be sure that the school room has been properly cleaned and disinfected. Send cloths along with the children and insist on their washing and drying their desks frequently. A small case containing a comb and one holding a drinking cup should be supplied every child in school. The cup should be brought home so it may be washed and scalded each day.

The school lunch is an important matter. It should always be packed in a besket or well ventilated box or bucket. Oiled paper is cheap and it keeps the food in good condition. Plain white paper napkins should be used, and after the lunch they can be used in place of a towel for drying the face and hands. Paper towels may be used or the small linen towels, sending a fresh one each day. Small custard cups ,glass jars with screw tops, and tart dishes aid greatly in putting up the school lunch.

The mother must not feel that just anything left over from breakfast will do for the lunch. Neither will a piece of soggy pie do that is left over from the day before. In th ecountry where institute members meet, mothers find much help in the exchange of ideas about such matters as preparing school lunches. It is surprising to some mothers how many new and attractive combniations may be used with materials always at hand without adding any cost and little effort.

Every mother knows the energy required to get the children off to school on time an in proper order. The ordeal is often accomplished only after much talking, perhaps scolding, and when it is over the mother is tired out completely. In order to eliminate all this confusion, one mother hung up a blackboard with the morning program outlined on it. It began with:

Arise promptly when the alarm clock rings.

Throw bed clothing over the foot of the bed.

Hang night clothes up to air.

Wash, brush teeth and dress.

Breakfast at 6.30.

Brush teeth again.

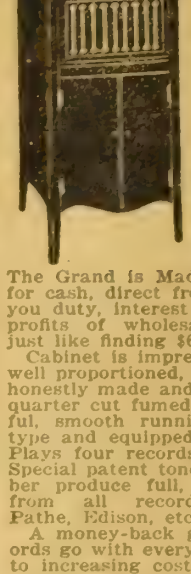
Brief work, play or study time.

Be ready to start at 8.00 o'clock.

If any special work was to be done in the morning by the childrei, a note was made on the blackboard the night before. The children then attended to this work while the mother prepared the lunches. With this sort of progam there need be no rush or confusion in the morning and each child learns to attend to his own personal needs.

When the children are ready to start, go with them to the door, just as you would were a guest leaving your home. Give them a cheerful goodbye and tell them you wish them a pleasant day. Then ,be ready to greet them when they return in the evening. Listen to their little problems. Enjoy hearing about their lessons. Be a good friend to your children and also to their teachers.

FACTORY TO HOME



48.50
Six Records FREE

Think of it! The Grand, a handsome, full sized, sweet toned, cabinet phonograph for less than dealers sell old fashioned table-style machines.

This low price is possible only because The Grand is Made in Canada and sold for cash, direct from the factory, saving you duty, interest charges and the huge profits of wholesaler and dealer. It's just like finding $60.00.

Cabinet is impressive in size, 42" high, well proportioned, of very artistic design, honestly made and beautifully finished in quarter cut fumed oak. Motor is powerful, smooth running, and non-vibrating type and equipped with speed regulator. Plays four records with one winding. Special patent tone arm and sound chamber produce full, clear volume of tone from all records.—Victor, Columbia, Pathe, Edison, etc.

A money-back guarantee and six records go with every instrument, but owing to increasing cost of material and labor this low price, $48.50, is good for a limited time only. Order now.

Each instrument well packed at factory and shipped as desired, F. O. B., Toronto. Remit by money order, postal note or cheque. Do not send money in envelope unless registered.

KEEPING CLOTHES AT THEIR BEST

The young woman who lives in the country often envies her friend who lives in the town or city, the chic spick and span appearance of her garments. Perhaps the rural dweller attributes the fact that her own garments are often lacking in freshness or appearance to her having to ride several miles before reaching the place where she is to shop or call.

Weak, Emaciated Nervous and Pale
MRS. FRANK BERRY SAYS SHE FOUND A CURE IN DODD'S KIDNEY PILLS
New Brunswick Woman Tells How She Got Relief From Ills That Sprung From Sick Kidneys.

New Jersey, Northumberland Co., N. B., Nov. 10th. (Special.)—Mrs. Berry, a well-known resident of this place, is just one more added to the host of New Brunswick women who are singing the praises of Dodd's Kidney Pills.

"Dodd's Kidney Pills have cured me," Mrs. Berry says. "I was weak emaciated and nervous. I would start in my sleep, and had bad dreams and nightmare. I was unable to do my work, my eyes were dull and heavy and I was troubled with billiousness headaches and constipation. My hands and feet were always cold, my skin was dry and harsh, and my face was marked with pimples.

"I was always tired and weak and I knew I had bad kidneys. I took just three boxes of Dodd's Kidney Pills and they have done me a world of good. They have cured me."

Mrs. Berry went right to the root of her trouble and treated her kidneys by using Dodd's Kidney Pills. She got results. If you have any of Mrs. Berry's symptoms, and have not tried Dodd's Kidney Pills, ask your neighbors about them.

a garment to a professional clean-
When it comes home notice just
the work has been done and
where the creases in sleeves and sides are placed.

If a garment becomes damp through being out in the rain it should never be hung carelessly, but placed upon a hanger to dry, and if necessary pressed before being worn. The young woman who would be dainty at all times does not hang her clothing in the closet at once as soon as she takes it off, but puts it in a current of air to dry and thus to be freed from all odor of perspiration. Any small repairs necessary should be made before a piece of clothing is put away that it may be ready for instant use when needed.

This is really the secret of being well dressed with a few properly chosen clothes. In truth, it is much better judgment to have just enough and not a garment too much. Our war time economies will teach us that we do not need an extensive wardrobe to appear at our best at all times. In selecting clothink we will no longer buy what appeals to us wholly, but rather the coats, suits, waists, skirts, shoes, etc. which supplement what we have so that we can dress appropriately for street, church, an afternoon or evening function, or appear well at home. Sometimes people fail to round out their wardrobe carefully and so find that they have three or four articles suitable for dressy affairs and not a single street costume complete from head to foot.

True economy consists in making the best use of what we have. Proper care in the way of cleaning, pressing, laundering and prompt repair work will double the life and service of any garment. It is surprising what a lot of money may be hung in the form of out-of-style clothes if one is not careful. It is vastly more satisfactory to have sufficient to dress in the mode and thus to save waste and remodeling. A new collar, a slight alteration of the sleeves, or attention to length of the skirt will often bring a suit up to the moment and do away with the necessity of buying something new. The thoroughly attractive woman is the one who is never overdressed but always neatly and suitably attired, and who is gracious in her manner.

Aprons are great aids to a neat appearance and fancy or serviceable ones should be on hand at all taimes to saves one's dresses about the house. There are few people who can wear the same clothes about their work or about th ehouse which they wear upon the street and look neat, so the vogue of the house dress is a sensible one and a first aid to economy as well.

GENERAL RULES IN WASHING SILK

In order to lengthen the life of a garment we must keep it in good repair, and carefully cleaned and pressed.

Too much dependence has been placed on dry cleaning establishments in recent years. Much of this work can be done at home with little or no extra expense.

Silk must be considered a delicate fabric, because it is an animal fibre and like all animal fibres, is sensitive to heat ,friction and akalis. If rubbed hard the fibre is broken, and the shiny effect lost. It sould never be boiled. These three facts give us our general rules to be kept in mind in washing all silks.

1. Strong soaps destroy gloss and turn silk yellow.
2. Heat yellows silk.
3. Friction breaks fibres and so weakens the fabrics.
4. Squeezing should take the place of rubbing and wringing.
5. Too hot an iron yellows, stiffens and cracks silk. It is safer to cover the silk with cheesecloth when pressing.

In order to carry out the above rules we must wash our silk carefully in warm soapy water. Add enough soap solution to make a good suds.

Soap solution may be as follows: Shave two cakes of a mild white soap into two quarts of water. Bring this slowly to the boil, to dissolve the soap, and add some of the solution to the wash water.

Wash the garment by a squeezing motion, using clean water of the same temperature as fast as the water becomes soiled.

To remove persistent spots of soil, rub some soap solution directly on the spot with the palm of the hand.

Rinse in several warm waters, place between dry towels and put them through a loosely adjusted wringer or else squeeze the water out carefully.

When nearly dry, iron with a moderately hot iron until perfectly dry. If the iron is too hot, the silk will be stiff and will crack readily.

If silk is colored, it will be better to try a sample, and set the color first by adding salt or vinegar to the water until the color no longer runs.

Colored silks are best washed with soap bark in place of soap.

Recipe for Soap Bark

1 cup soap bark, 1 quart of water. Cook together twenty minutes. Strain and use like soap solution.

A new appearance, and yet not a stiffness may be given by the use of gum arabic in the last water before pressing. This often prevents a thin silk from looking washed.

THE EYES

Take as good care of your eyes as you would of your watch. You can buy a new watch, but you can't buy new eyes.

To Keep Your Eyes in Good Condition

Wear glasses if the doctor advises you to do so.

Don't use your eyes in a poor or flickering light.

Have the light shine on your work or book—not in your eyes.

Hold your work or book 14 or 15 inches from your eyes.

Don't rub your eyes with dirty hands.

Don't use other people's towels, wash cloths, handkerchiefs, etc.

Have sore eyes and granulated lids treated promptly, and as long as the doctor thinks necessary.

If you suspect eye trouble, see a doctor at once.

FREE PRIZE PUZZLE
$4,500.00

In Cash has been Given Away FREE
also hundreds of Merchandise Prizes
$200.00 more IN CASH will be Given Away as follows

1st Prize, $50.00 in Cash. 2nd Prize, $40.00 in Cash
3rd Prize, $35.00 in Cash. 4th Prize, $25.00 in Cash
5th to 9th Prizes—Each $10.00 in Cash.
TOGETHER WITH MANY MERCHANDISE PRIZES

Herewith will be found the picture of an Aviator who has just dropped a bomb on a pile of Shells. At first glance the Airoplane and the Explosion appear to be all there is in the picture, but by careful study the faces of several soldiers will be found. There are 7 of them in all. Can you find them? It is no easy task but by patience and endurance can be accomplished.

You may win a cash prize by doing so. Many have done this as will be shown by the names and addresses which we will send you. If you find the faces mark each one with an X, cut out the picture and send it to us, together with a slip of paper on which you have written the words "I have found all the faces and marked them." Write these nine words plainly and neatly, as in case of ties, both writing and neatness are considered factors in this contest.

This may take up a little of your time but as TWO HUNDRED DOLLARS in cash and many merchandise prizes are given away, it is worth your time to take a little trouble over this matter. Remember all you have to do is to mark the faces, cut out the picture and write on a separate piece of paper the words, "I have found all the faces and marked them."

WE DO NOT ASK YOU TO SPEND ONE CENT OF YOUR MONEY IN ORDER TO ENTER THIS CONTEST

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not, and we will send you a complete Prize List, together with the names and addresses of persons who have recently received over Four Thousand Five Hundred Dollars in Cash Prizes from us, and full particulars of a simple condition that must be fulfilled. (This condition does not involve the spending of any of your money.)

Winners of cash prizes in our late competitions will not be allowed to enter this Contest.

This Competition will be judged by two well known business men of undoubted integrity, who have no connection with this Company, whose decisions must be accepted as final.

Upon receipt of your reply we will send a complete list of the names and addresses of persons who have won $4,500.00 in Cash Prizes in recent contests held by the publishers of this advertisement. Although these persons are entirely unknown to us, they are our references. An enquiry from any one of them will bring the information that our contests are carried out with the utmost fairness and integrity. Your opportunity to win a good round sum is equally as good as that of anyone else, as all previous winners of cash prizes are debarred from entering this contest.

The Strain of Overwork

Your work is heavy, and sore, tired muscles are a common occurrence. Each time your back aches you blame it on your work, and just there the danger lies—for that pain in the back may not be from strain, as you suppose, but the forewarner of Kidney or Bladder trouble.

For your own interest, it is best to be particular and sure, as Kidney troubles inevitably pull you down and destroy your earning power.

Take note of these symptoms. Do you get dizzy and have repeated headaches, painful urination, brick dust deposits, or feel drowsy and, generally, good for nothing? If so, it is your kidneys that are bothering you—not work—and Gin Pills are necessary.

No person can work properly when they feel sick, tired and dizzy all the time. The more they try, the more energy they use up; and this only tends to aggravate their condition, as the kidneys are already tired out with their endeavors to relieve their congested state and perform their function properly.

The kidneys are d licate and vital organs; once they become affected through any cause—you suffer until the congestion is relieved and the cause remedied.

Don't let your system become run down. A box or two of Gin Pills will relieve those kidney complaints and restore your old-time health and strength.

Your health is priceless. Don't risk losing it. Keep your kidneys in order always by taking Gin Pills.

Sold everywhere for 50c a box Write for free sample to The National Drug & Chemical Co., of Canada, Limited, Toronto, Ont. 172

ARE YOU FORGETTING

Are you falling down in your overseas letter writing? Of course you are not forgetting the brother or the son, and you write to them regularly. But how about the boy who was only a friend of the family, the boy from your own home town, to whom you promised to write often and give him all the home news? Perhaps he didn't belong to anyone in particular, maybe he hasn't had any real home for years; then, again, perhaps his home was in the Old Country or down east or in the States, and he had just drifted and your home had become his home in late years. You were seized with a sort of enthusiasm for the work during the first days. There was plenty to say. But after a few months the novelty of writing wore off and now you write seldom—or never.

When the boy has first left his home town he needs all the letters he can get to ease the first heartaches, to relieve the first touches of home-sickness. But in the early days, too, he has new interests, new surroundings, new sights, all of which command his attention and help him to become contented with his new envirinment. After the first months have gone and he has entered the long period of routine and grind that must continue until the end, his longing to be back home is just as strong, and there is no new interest to dispel his melancholy. What could be more disheartening to a boy under the daily grind of modern warfare than to come, time after time, to the mail delvery and be told "Nothing for you." The boys need the letters more now than they ever did, and perhaps after reading the following extract from an Old Country paper, written by Vernon Bartlett, on "How the Letters Come," you will realize just what letters go through before they finally get to their destination, and just how eagerly the boys wait for your letters. Don't forget to write:

"Letters are great travelers For 3 cents you can send them all around the world—through the hot, glaring bazaars of Tangier or up the fever-haunted Congo River; along the Trans-Siberian Railway or into the frozen stillness of Alaska. They can go everywhere—even if they do sometimes loiter for 25 years or so on a journey of a hundred miles.

"But no letters 'see life' as do the letters that go to the front. If they escape the submarines they are heaped into filthy trucks; if they survive the jolting an drattling of the motor-lorry that takes them from the rail-head to divisional headquarters, they are thrown down in some field or farm yard in the gentle care of the Quarter-master; if they are not crumpled and sodden beyond repair after the long miles in the pouring rain from the regimental transport to the nearest point that horses go to the firing line, they are left by the roadside with the company's rations until a carrying party looms up in the darkness to take them up to the trenches half a mile away.

"It is then that the journey becomes exciting. The slightest rain turns the earth into two inches of mud, and the Post Corporal slides and staggers under the weight of the letter bag that bumps from side to side of the narrow winding communication trench.

Sometimes the Corporal may strike across country. As each Verey light shoots up in the sky, he crouches down in the mud, and bullets swish by or go 'pht' into the earth close at hand. Someone near the tail of the party is hit, and his two neighbors hand their loads over to others and carry the wounded man back to the dressing station on his waterproof sheet.

"When the ration party at length files into the front trench the Post Corporal dumps down his letter-bag in the most open place he can find, for even the strictest discipline could not prevent a crowd when the post arrives. Someone brings up a little electric torch, and one by one the love-letters and bills and papers from home are handed out to the eager men of the company.

"Then the crowd dwindles away to read its letters by the light of the brazier fire, and the Post Corporal brings the few envelopes that have no owner to the Captain's dug-out. They are re-adressed 'killed' or 'wounded,' as the case may be, and go oc down the line again to teh person who wrote them or to some bandaged 'Tommy' in hospital.

"And the Post Corporal curls up in a dug-out, too muddy and sleepy to be thankful that Fritz, probably busy with his own letters from Gretchen, did not shell the comunication trench."

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

MRS. M. SUMMERS, Box 309
Windsor, Ont.

CORRECTION

nIn the report if the Women's Institutes Convention recently held in Fredericton an error inadvertedly appeared.

It was Mrs. Helen Hutchings of the Quispamsis Institute who presided at the Tuesday evening session, not Miss Helen Hutching of Rothesay. Rothesay is one of the localities in which a branch of the Women's Institute does not exist, but which we trust ere long will come in line with the organized movement "For Home and Country."

RECOMPENSE CHILD FOR WORK

A great many people expect their children to work without recompense. This is a grave mistake. We, ourselves, expect gain at the end of each day. We labor in the expectation of reward. If our pay were taken from us most of us would cease to labor. Then is it not true thta some of us are doing this very thing in dealing with our children? We, too often, expect them to work for us without pay.

Let's consider the child's side of the mtater. Perhaps he has a long cherished plan which he cannot execute without the necessary means, and knows if he asks his father for it will be refused, for father and mother sometimes think it a waste of money to buy things that are absolutely unnecessary to one's comfort. This makes him feel dejected, for he does not look at the istuation in the same way. He looks ta it from his own point of view, and thinks himself much-injured boy and grows dissatisfied with everything in general and does not care whether or not his chores are done perfectly and spends his time in grieving over his hard position.

162

Each little one who has asked re-
tedly for pennies and been repeat-
y refused has been asked over and
r again to fill the woodbox, to bring
sh water from the spring, to hunt
eggs and numerous other things
ich are easy for little hands to per-
m. If we older ones had to do all
he things we ask our children, over
h day without a single hint of re-
rd, we would be like the discontent-
child who wonders why he never
s any pay.

Ve need not pay children for every-
ng they do do for us, for there are
ne things which they should be
ght to do for us without expecting
ard. But we should allow them
ney to call their very own once in
while at least. They do their work
h greater zeal and they feel free to
nd the money, because they earned
honestly by helping father and
ther. In this way they learn the
ue of money and how to spend it
ely. They will make mistakes at
t, but these very mistakes will
rd them against making greater
s in the future. Children must be
ght the true value of money and
v not to waste it.

Now is a good time to teach chil-
n economy. The war has taught
or is teaching all rather, to con-
ve all food, and economize very
sely. This is of the greatest im-
tance if we can win the war.

POISE

The majority of people lack poise.
is this lack which makes so many
ple tiresome and unrestful, the
son why they get on one's nerves.
ack of poise is both physical and
ntal. There is the man whose
nds, arms, legs body, each or all,
seldom still. He tires everybody.
ere is the other man whose mind
ggles, whose thoughts do not stay
l. He gives only partial attention
the subject, jumps to another and
k again, never quite finishes what
is talking about. He, too, is a
ariness.

Nor is unrest of mind and body con-
ed to men. Women also are guilty.
e present world-wide unrest may
somewhat responsible for the no-
eable lack of personal poise in most
ple, for the "urge" which seems to
impelling the individual more than
merly away from poise and repose
manner.

f you are guilty in this respect, cul-
aet poise. Don't you see it in the
cessful men you know, is it not
aracteristic of those you most ad-
e. Poise adds to personality.

t is not easy to gain poise if it is
natural to you, but it is worth the
ort. Poise is good for the health,
valuable in business and in men or
men women is an attribute which
full of charm.

NSE OF HUMOR A BLESSED GIFT

At a dinner recently the guests were
cussing what gift they would choose
he "good fairy" should be ladling
m out. Riches, good looks, fascin-
on—the whole gamut was run, until
young matron's turn. With a
gh, she said: "If I could have but
gift, what would I take? A sense
humor."

That woman knew the secret of com-
table living. There is no situation
trying, no lot so hard that it cannot
lightened by the power to see the
in it. The humor sense is some
es called dangerous and the sober-
es even deem it frivolous. There is
greater safety valve, however, and
happy possessor should deem him-
f blessed of the gods.

Some claim that few women have
eal sense of humor. This si as false
most of the theorizings about the
. A woman may not be able to see
in the same things as does a man,
too many women are facing dis-
ssing conditions and actually get
g amusement out of them to deny
sixth and most blesse dsense.

Lots of women think they have a sense of humor when they have only a doggged sort of "grin-and-bear-it" take life cheerfully, and keep on fighting than to "chuck the job" but that is not the saving sense.

If you really have it, this sense of humor, and do not have to force a scmile, you chuckle because you cannot help it. While doing the most impossible things, your thoughts will be bubbling over with the funny side of it.

Some women think they possess this sense because they can see a well-sharpened point to a joke—that is only perception, a uqick wit. The real sense of humor enjoys a joke just as much as its owner's expense as at her neighbors.

MISINFORMATION ABOUT "CATCHING" COLDS

At this season of the year health magazines, and even some public health publications are regarding common colds. Overheating, lack of exercise, fresh air and sleep, and a hundred other indiscretions of ordinary living are recited as definite cause of colds, while as a matter of fact all acute colds are due to the contraction of an infection. You can "catch" cold only from a person wha has a cold. Soiled handkerchiefs, dirty hands, common drinking cups and eating utensils are generally the vehicles by which the infection is transferred from the sick to the well. Overeating, lack of eyercise and all other causes in the encyclopedia of misinformation may be predisposing factors by which resistance is lowered, providing a fertile field for the infection.

The Dreaded Message

IT is the women that have suffered most in this terrible war—

"For men must work
And women must weep."

Theirs has been the worry and anxiety. The watching and waiting in constant dread of what might happen.

Because mental suffering is far more distressing and debilitating than physical pain and discomforts women have had the greatest burden to bear.

The strain has been both severe and long, and the result is an alarming increase in diseases of the nerves. Nervous headaches, neuralgic pains, nervous prostration and exhaustion, restlessness, irritability and melancholy.

These are some of the indications of nervous breakdown.

The building up of an exhausted nervous system is oftentimes a somewhat tedious process, but with the persistent use of Dr. Chase's Nerve Food you can be sure that restoration is both natural and lasting.

Get out into the fresh air as much as possible. Seek the companionship of healthy, cheerful people, and depend on this food cure to enrich the blood and supply to the depleted nerve cells the nourishment essential for their restoration.

Mrs. S. N. Hurst, Barrie, Ont., writes:

"About thirteen years ago, owing to a shock I had received, my nerves simply got the better of me. I could not sleep at night nor work in the day time. I suffered from a trembling sensation in my stomach, which kept up continually. I doctored for about a year and a half without getting any benefit. Then someone advised me to try Dr. Chase's Nerve Food. I did so, and at first was nearly discouraged, but as I was finishing the first box I found I was getting a little better. I then continued the treatment until I had taken six boxes, and during this time seemed to be getting stronger and better as time went on. The trembling in my stomach ceased, and I was able to eat and sleep without any difficulty. I am very grateful for having been advised to use Dr. Chase's Nerve Food, as I had about given up hopes of ever getting any relief. I therefore gladly recommend the use of this treatment to any one suffering from nervous trouble of any kind."

In order to be sure of getting the genuine Dr. Chase's Nerve Food it is only necessary to see the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author, on the box you buy. 50c a box, 6 for $2.75, all dealers, or Edmanson, Bates & Co., Ltd., Toronto.

Straw, 60c to 70c per 100 lbs.

MILLFEEDS ARE SCARCE

Flour Mills Are Only Offering 100 Bags of Bran or Shorts to Car. Oats Have Stiffened in Price

Mill feeds are still scarce. The flour mills are unable to fill the orders pouring in on them. They are offering 100 to 150 bags of feed to the car. And they are unable to do more. It takes 76 per cent. of the whole wheat to make flour and the amount of offal is almost negligible. The outlook for future supplies in 1919 is not bright. The food controllers of the Allied forces have declared their intention of feeding the enemy population, who are starving. This means an even greater demand for food stuffs and it may be months before normal conditions in feeds are established. The Maritime Farmer has been able to supply many cars of standard feeds, at cost, to farm organizations and is still in a position to do so. If you want feeds, we suggest that you get your agriclutural society together and make up an order. Feed is very scarce. Transportation difficulties will be taxed to their utmost this winter and there will be delays in deliveries. Re-cleaned feed oats are quoted, Nov. 15th delivered, at $1.06 per bushel. P. E. I. oats are quoted at $1.05 per bushel. These are for car lots. The Maritime Farmer will buy for you if you organize. Get busy and co-operate.

MONTREAL

COUNTRY PRODUCE

Montreal, Nov. 16.—There were no new developments in the local egg situation today, except that supplies of strictly new laid and fancy eggs are very scarce owing to the exceedingly light receipts from the country and in consequence the dealers find it difficult to meet the requirements of the trade. There was no change in prices to day, but the prospects are that as soon as the weather becomes colder values will for these grades be still higher. The trade in cold storage eggs continues active in a wholesale jobbing way, and prices are firmly maintained. The receipts today were 336 cases, as compared with 1,358 for the same day last week and 1,271 for the corresponding date a year ago.

We quote wholesale jobbing prices as follows:

Strictly new laid eggs.....65c to 70c
Fresh selected stock.....50c to 54c
Storage selected stock.....00c to 53c
Storage No. 1 stock.....00c to 49c

There continues to be an active demand for all lines of poultry and as supplies of live birds are coming forward freely for the season of the year a large trade was done, and the tone of the market remains firm with no change in prices to note. The demand for dressed poultry is also good, of which the offerings are not large as yet on acocunt of the mild weather prevailing, but all supplies coming forward met with a ready sale at firm prices.

We quote prices for dressed poultry as follows:

Turkeys, per lb.....36c to 38c
Chickens .....28c to 32c
Ducks .....28c to 30c
Fowl .....27c to 30c

The condition of the market for potatoes was unchanged today, prices being steady with a good demand for supplies in a wholesale jobbing way, and a fairly active trade was done with sales of Green Mountains at $2, Quebec white at $1.75 and other Quebec varieties at $1.60 per bags of 90 lbs., ex-store, while car lots of Green Mountains were quoted at $1.75, and Quebec white at $1.50 per bag of 90 lbs., ex-track. The trade in Quebec turnips was fairly active and prices rule firm at $1.25 per bag of 70 lbs., and winter red onions sold freely at $1.75 per bag of 70 lbs., ex-store.

Chicago, November 13.—Eggs higher. Receipts, 5,205 cases. Firsts, irregular. Receipts, 11,866 cases. Fresh gathered, 70c; fresh gathered, regular packed, extra firsts, 67c to 69c; do. firsts, 64c to 66c; State Pennsylvania and nearby western hennery, whites, fine to fancy, 92c to 96c; State Pennsylvania and nearby hennery, browns, 70c to 75c; do. gathered browns and mixed colors, 60c to 70c.

New York, November 13.—Hops firm. State, medium to choice, 1918, 25c to 31c; 1917, 18c to 20c. Pacific Coast, 1918, 29c to 30c; 1917, 18c to 20c.

THE PROVISION MARKET

Montreal ,Nov. 16th.—There was no further developments in the condition of the market for live hogs today, but the feeling was very firm at all the leading centres owing to the continued good demand from packers for supplies and prices in the Toronto market yesterday were firmer with sales at $18.25 per 100 lbs, fed and watered, while selected lots at Winnipeg sold at $17.50 per 100 lbs. weighed off cars, and in this market today a fairly active trade was done in selected stock at $18 t o$18.25, and mixed lots sold at $17.50 per 100 lbs., weighed off cars. A feature of the trade was the demand from Ontario packers for supplies in this market and shipments of 6 car loads were made t oToronto. The domestic trade in dressed hogs was fair and prices were unchanged. Sales of abattoir fresh-killed stock in a wholesale jobbing way were made at $22.50 to $23 per 100 lbs.

The tone of the market for smoked and cured meats remains steady with a fair amount of business passing in a wholesale jobbing way in most lines for domestic and country account. Sales of 8 to 10 lb. hams were made at 37c per lb., 12 to 15 lbs, at 35c to 36c, and heavier weights at 34c. Breakfast bacon sold at 43c to 53c, Windsor selected bacon at 45c to 46c, and Windsor boneless bacon at 48c to 50c per lb. The demand for barrel pork continues somewhat limited, and trade is rather slow. American bean pork in car lots was quoted at $41 per barrel, duty paid, short-cut clear pork at $66, and clear cut fat back pork at $58.

A good steady trade continues to be done in lard in a wholsale jobbing way and prices show no change with sales of Canadian pure leaf grades at 31c to 31½c per lb. in 20-lb wood pails, and at 32½ to 33c per lb. in 1-lb. blocks, while American compound lard sold at 27c per lb. in 20-lb. wood pails.

The receipts of provisions today were 654 packages lard, 9 boxes hams and bacons, and 229 packages tinned meats.

DAIRY PRODUCE MARKET

Montreal, Nov. 16.—The receipts of butter today were 3,121 packages, as compared with 2,093 for the same day last week, and 172 for the corresponding date a year ago. The market today was without any special feature to note. There was no improvement in the demand for round lots, which would indicate that buyers in most cases are well supplied for the present and are awaiting developments. The trade in a wholesale jobbing way continues fair and prices rule firm with sales of finest creamery at 50c per lb. in solid packages, and at 51c per lb. in 1-lb. blocks.

We quote the wholsale prices as follows:

Finest creamery .....49c to 50c
Fine creamery .....48c to 48½c
Finest dairy .....44c to 45c
Fine dairy .....40c to 42c

The receipts of cheese today were 6,682 boxes ,as against 5,847 for the same day last week, and 2,413 for the corresponding date a year ago. The condition of the market was unchanged, and as the season is now fast drawing to a close the indications are that there will be not be any new developments of importance. The demand from exporters is good for all offerings, and supplies are going forward freely to the English markets.

The following prices are being paid by the Commission.

No. 1 cheese 25c
No. 2 cheese 24½c
No. 3 cheese 24c

New York, November 15th.—Butter firm. Receipts, 12,133 tubs. Creamery higher than extras, 63½c to 64c; creamery, extras, 92 score, 63c; firsts, 58½c to 62½c; packing stock, current make, No. 2, 37c to 37½c. Cheese firm. Receipts, 5,941 boxes. State, whole milk, flats, fresh, specials, 33c to 33½c.

THE BALED HAY MARKET

Montreal, Nov. 16.—There was no actual change in the condition of the market for baled hay owing to the fact that there has been no material increase in the shipments of supplies from the interior, and until there is prices are likely to be firmly maintained, as the demand at present is in excess of the offerings on spot and stocks are light. Sales of car lots of No. 1 timothy were made at $26 to $27, No. 1 light clover mixed hay at $26 to $27, No. 2 timothy at $25 to $26. No. 2 clover mixed hay at $24 to $25, and No. 3 timothy at $23 to $24 epr ton ex-track.

MILLFEED AND ROLLED OATS

Montreal, Nov. 16.—A weaker feeling has developed in the market for some lines of millfeed and prices for these foods have been reduced all the way from $2 to $5 per ton, which is attributed to some extent to the increased offerings, and that fact that competition for business is keener now than it was some months ago. The demand for supplies from local and country buyers is reporter good and the movement is large with sales of pure grain moullie at $68 to $70, pure oat moullie at $64, barley feed at $60 to $62, and mixed moullie at $50 per ton, including bags, delivered to the trade. The condition of the market for bran and shorts is unchanged as prices are fixed by the Government. The trade in these lines is active and supplies are kept closely sold up. Bran is selling in car lots at $37.25, and shorts at $42.25 per ton, including bags, ex-track, and bran at $39.25, and shorts at $44.25 per ton, ex-warehouse, including cartage. The market for rolled oats was about steady with a fair volume of business passing in broken loas of standard grades at $4.[illegible] to $4.90 per bag of 90 lbs., and Gold[illegible] cornmeal at $5.50 to $5.75 per bag, d[illegible] livered to the trade.

RELIABLE VETERINARY WORK

Maritime Farmer Will Supply Book Which Should be on Every Farm at Low Cost of 75c., Postage Paid

The other day a subscriber wrote [illegible] and asked us to send him a treat[illegible] on veterinary subjects. He suggested that every farmer should have [illegible] in his home. So we looked about [illegible] a suitable work on the subject and se[illegible]ected "The Veterinarian," by Charl[illegible] J. Korinek, V .S. This work is r[illegible]ning through the fourth edition. [illegible] is a tretaise written in plain Engl[illegible] so plain that any man who reads [illegible] understand. It deals with diseases [illegible] the horse, cattle, swine, sheep a[illegible] goats, poultry and miscellaneous. T[illegible] book is cloth bound, of 256 pages a[illegible] is particularly well indexed. The pri[illegible] postage paid will be seventy-five cent[illegible]

PREVENTING SCALD IN STORAG[illegible]

Scald is the most prevalent a[illegible] most serious of the skin blemishe[illegible] It is a browning or blackening of t[illegible] skin that does not extend into t[illegible] flesh, but gives the fruit a scalded [illegible] baked appearance, which greatly le[illegible]ens its commercial value. It cannot b[illegible] controlled absolutely, but throug[illegible] proper handling and storing it can b[illegible] greatly reduced.

There is a great difference in var[illegible]ties in their susceptibility to scal[illegible] Some, like Spy, Jonathan and Sp[illegible] are comparatively immune, whil[illegible] Rome Beauty and Wagner often de[illegible]elop an undue amount.

If apples are allowed to reach m[illegible] turity before picking, then are packe[illegible] and placed at once in a temperatu[illegible] of 32 degrees, they will sow much le[illegible] scald than if picked when immatu[illegible] or overripe, or if delayed for one [illegible] two weeks before being placed in sto[illegible] age. As soon as the fruit is picke[illegible] the ripening process continues eve[illegible] more rapidly. Apples held at 32 d[illegible] grees scald somewhat less than tho[illegible] held at 35 degrees, or in comme[illegible] storage.

Of even more importance than qui[illegible] storage and cooling is maturity [illegible] time of picking. Apples that are im[illegible] mature will frequently scald very ba[illegible]ly, but as the picking season progres[illegible]es and the apples reach maturity, the[illegible] will keep much longer and bette[illegible] Good judgment and experience ar[illegible] the only reliable guides to determi[illegible] the proper period for picking ea[illegible] variety.

HARVESTING THE FIELD BEAN[illegible]

For the small grower the old met[illegible]od of pulling the beans and stackin[illegible] them around a pole is possibly th[illegible] best practice. A few sticks are la[illegible] on the ground and the beans piled o[illegible] these around the pole to a height o[illegible] four to six feet. They are finally tie[illegible] around the pole to keep the top fro[illegible] blowing off.

Where there is a half acre or mo[illegible] of beans this method may be impra[illegible]ticable, because of the greater amoun[illegible] of work necessary. Under these co[illegible]ditions the beans are allowed to stan[illegible] until the leaves begin to fall, whe[illegible] they are pulled down and thrown int[illegible] windrows or small piles. These ar[illegible] turned frequently until thoroughly dry when they are either threshed immed[illegible]iately from the field, or drawn to th[illegible] barn and placed in the mow withou[illegible] tramping or packing. They should re[illegible]main in the mow several weeks before threshing. It is important that they be dry when taken to the barn, and that they be placed loosely in the mow, without being tramped or piled very deeply so as to pack.

WINTER RHUBARB EASILY PRODUCED

The production of rhubarb in winter as become of considerable value mong gardeners. It is easy to do if rtain methods are followed. If one making a permanent business of ubarb forcing it is necessary each ear to set out a new bed, as plants ice formed are of no further value. the spring large roots should be dug it split in one bud section and re-aced in rich, moist ground. During e growing season they are kept cul-vated and free from weeds. In the ll they are covered with manure. ext spring the second bed is planted before. That fall a large part of the rst bed i staken up, leaving sufficient replant another bed the next spring. he roots are taken up the last thing the fall, before the hard freezing eather comes, and are placed in piles a sed where they can easily be got dufing the winter, but will remain ozen. About December first take a sufficient number of roots, place ese bud side up on the floor of a arm cellar—about 68 degrees or 70 egrees—and cover with an inch of nd. Be sure to fill in all interspaces. eep this sand moist. About a week ter the buds will begin to swell, and from four to six weeks, depending on the heat of the room—the cooler e slower the growth—you should ave rhubarb ready for market. If a nstant supply is required, make a ew bed every two or three weeks ring the winter. Be sure to keep all ght dimmed. Put burlap or brown aper over the windows to get the pink olor so much desired.

CHECKING CELERY BLIGHT

When the celery begins to blight pray it with Bordeaux mixture and estroy the diseased parts of the lnts. This, experiment station men y, will check the disease. When the crop has been harvested all debris should be cleaned up and burned as it may harbor the blight fungus over the winter. The proper strength of Bordeaux is 4 pounds of copper sulphate, 4 pounds of lime and 50 gallons of water. If the young seedlings are sprayed before transplanting and afterward occasionally, the blight will be prevented.

YELLOW BUTTER NOT ALWAYS RICHEST

The average consumer of dairy produce is inclined to place an unwarranted value upon the yellow tint of cream and butter in the belief that the color is an evidence of richness in nutrients. As a matter of fact yellowness may be imparted to cream by some of the comon bacteria present in the milk at the time it leaves the cow's udder or which develop in it subsequently, as well as by two common pigments of vegetable origin. These pigments, carrotin and xanthopyll, are assimilated to a much greater extent by Jerseys and Guernseys than by other animals and by being eliminated from the system through the milk, impart the rich yellow color characteristic of milk from these breeds.

These plant pigments are quite harmless, but, of course, have no nutrient value. However, no one relishes the idea of consuming milk or cream which owes its apparent richness to swarms of bacteria, even though they may bear a fairly good reputation. Moreover, some of them are deleterious to health. The use of well-cleaned and sterilized utensils, with due regard to the health of animals, including the condition of the udder, are usually sufficient to avoid such abnormalities as yellow milk, "bloody" milk, ropy milk and other similar conditions.—R. F. Bourne.

FALL FEEDING OF DAIRY COWS

The wise dairyman will feed liberally during the fall months. Cows which are not well fed at this time will go into the winter thin in flesh and with reduced milk flow. It will be expensive and largely in vain to attempt to bring them back to normal flow after they go on winter rations.

It wil pay to begin feeding silage and hay early. The extra feed given at this time will not only bring good, immediate returns, but agect the milk flow for the whole year by putting the cow in good condition to go through the winter months. Cows which go into winter in good vitality and with undiminished milk make most economical use of the high priced feeds given them during that period. Keep up the milk flow during the winter months by proper fteding. It will pay.

(Gloucester County will appear next issue)

"The destructiveness of the cut worm has not been so evident for years," declares Mr. F. Abraham, chairman of the Home aGrdens and Vacant Lots Section of the Canada Food Board. "An early season to some extent minimized the loss from this pest. The time to attack the cut worm is in the fall, if next year' sravages are to be controlled. The eggs of this worm are laid in the autumn, and if after all eggs are laid, the ground is well broken up or plowed, the larvae will be so deeply buried as to destroy ninety-five per cent. of them.

"I strongly advise," he added, "that every available foot of town land be plowed this fall. During the winter there will be plenty or time to organize for planting it in vegetables, or even cereals, but get as much fall plowing under way as possible. Cities and town are the only available source of surplus labor, and every ounce of food will be required."

Rush the apples into cold storage as soon as possible after they are picked. Prompt storing a ta temperature of 32 degrees will mean longer keeping (a month with some varieties) and much less loss and injury from scald, scab and roots.

FERTILIZERS FOR 1919

We Supply Fertilizers for Every Crop and for Every Soil

Making two blades grow where only one grew before. By using Shur-Gain Fertilizers, you can increase your yields without additional land, labor, or seed.

For information and prices

Gunns LIMITED

ST. JOHN, N.B.

We would suggest the importance of an early order—it will give you the benefit of present prices and insure delivery.

Potato growers have denomstrated that commercial fertilizers scientifically used will yield a splendid profit.

We have just the grade that you require for your soil and can give you much valuable information.

We specialize on potato fertil zers and can fill your wants at prices that are worth investigating.

GUNNS LIMITED, 676 Main St., St. John, N.B.

COMMON DISEASES OF THE DIGESTIVE ORGANS OF CATTLE

(Continued from page 101)

are present and to prevent the formatio nof more. It will depend upon the severity of the attack and the extent of the disetnsion of the rumen whether it will be wise to attempt the immediate removal of the gases or to administer drugs to neutralize them. When bloating is not excessive, with little danger of death occurring quickly, the administration of any drug that will nteralize the gases may, and should, be effective. For this purpose oil of turpentine (commonly called spirits of turpentine) is probably the best simple remedy. This is given in 2 to 4 oz. doses, according to the size of the patient, and the state of distension. It is wise to administer it in some vehicle to prevent irritation of the mucous membrane. The best vehicle is raw inlseed oil 1 to 1½ pints. When oil is not on hand melted butter or lard or whole milk will answer the purpose well, but turpentine will not mix with water; at the same time when oily vehicles are not readily obtainable it may be given in water if the bottle be constantly shaken. Hyposulphite of soda in 1 to 1½ oz. doses mixed with about a pint of warm water also gives good results. Carbonate of ammonia in 4 to 6 dr. doses, or bicarbonate of soda baking soda) in 1 to 1½ oz. doses also acts well, but none of these act so well or so promptly as oil of turpentine. The Kentucky Experimental Station highly recommends the adminstration of about ½ oz. of formalin in a quart of water and cite many cases in which it has given excellent results. The writer has not experimented with this drug in this connection, having had good results form oil of turpentine. At the same time the use of formalin is worthy of a trial, but it must be remembered that it is a very strong astringent and irritant, hence must be diluted with at least a quart of water.

In addition to administering the dose (whatever we select) it is good practice to put a hay rope, a piece of wood or other material about two inches in diameter, into the patients mouth and fasten it there. This tends to cause a working of the jaws and facilitates the escape of gas through the œsophagus. If the desired results be not obtained in an hour the dose may be repeated.

In cases where bloating is extreme there is danger of death resulting quickly from rupture of the organs mentioned from suffocation or from absorption of gases. In such cases we cannot wait for the action of medicines given by the mouth. Relief must be prompt and the gases must be removed by mechanical or surgical means. In some cases the passing of a rubber tube down the œsophagus to the stomach, will give imemdiate relief. The mouth must be kept open by an ordinary gag, a mouth speculum, a small clevice or other device; the tube or 6 serves the purpose well is oiled, carefully passed until the end enters the rumen. If that part of the rumen be not blocked by semi-solid contents the gas will immediately escape through the tube, but is it is the gas cannot enter the tube.

In such cases an opening must be made on the left side at the most prominent part between the point of the hip and the last rib through the skin, muscles and wall of the rumen through which the gas will escape and give parctically immediate relief. The hair should be clipped off and the seat of the operation, the instruments, and the hands of the operator thoroughly disinfected with a five per cent. solution of carbolic acid, one of the coal tar antiseptics or other good disenfectant. An instrument called a trocar and canula is the proper one to use. It consists of a metal tube with a sharp pointed metal rod passing through it, the point of the rod extending some distance longer than the tube. An incision may be made through the skin with a knife or the instrument forced through without an incision. It is forced well into the rumen, the trocar then drawn out, which leaves the canula or tube inserted through which the gas escapes. When this instrument cannot be procured in time an opening may be made wiht a knife and the lips of the wound held apart to allow the escape of gas. Unless the opening be quite large no after treatment is required other than keeeping the wound clean and dressing regularly with an antiseptic. When the proper instrument is used after-treatment of any kind is seldom necessary.

In all cases it is good practice, after bloating has disappeared, to administer a laxative of about 1 lb. of Epsom salt or 1½ pints raw linseed oil, and feed lightly on laxative food for a few days.

INTUSSUSCEPTION

(Continued from page 113)

gestive organs, particularly resembling those of obstinate constipation. There is a cessation of intestinal murmur, restlessness, pain shown by pawing, wandering about, lying down, endeavoring to lie on the back, sweating, crouching, sitting upon the haunches, pressing the rump against any solid object when standing, anxious expression. The pulse is at first full and frequent, but as the disease advances it decreases in force but increases in frequency, in many cases becoming intermittent and afterwards imperceptible at the jaw. There will be little or no passage of faeces. The mucous membranes become injected and red, respirations are frequent, and apparently labored. The abdomen, at first of normal appearance, becomes fuller, and in some cases distended with gas. The mouth may be moist and clean, or dry and hot, with an offensive odor. The restlessness continues, the extremities are usually cold. He may rear on his hind legs. After a variable time pain usually ceases, and he will

The Cheapest Belt Power on Earth

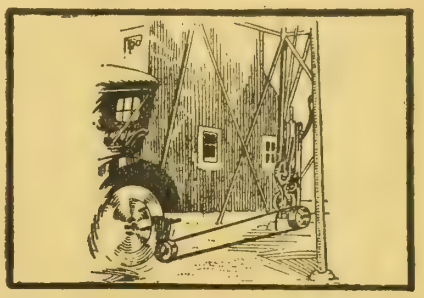
Farms need cheap power. The farm with cheap, easily available power is a gold mine. And LAY Porta Power brings to farms the cheapest belt power on earth.

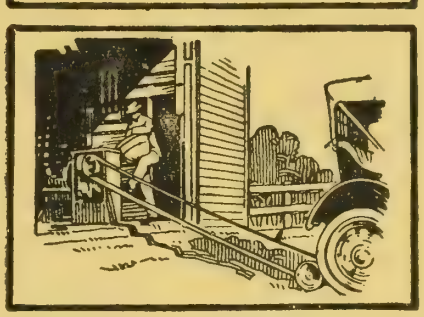
LAY Porta Power uses the motor in your automobile—and runs any kind of machinery around the farm. Saves the price of a gasoline engine. Is portable (weighs only 100 lbs. and will work anywhere you can take your car). Saves on gasoline. Pays for itself in a couple of months. Speeds up farm work and makes *bigger profits*. Makes a hired man of your car.

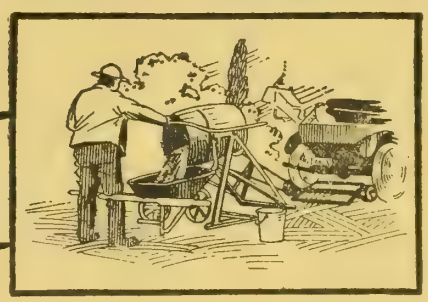
You just put LAY Porta Power on the running board. Drive to the job. Slip LAY Porta Power under the rear wheels of your car. Hitch a belt to the pump, feed grinder, saw—any piece of machinery—and start the engine of your car.

LAY Porta Power takes the power from the rear wheels of your car. Gives you up to 10-h.p. at any speed. And costs only a fraction of the price of a gasoline engine.

The full story of LAY Porta Power should be in every farmer's hands. Write to your nearest distributing point for literature. Or send $5.00 and LAY Porta Power will be shipped to you—balance on delivery.







LAY Porta Power

Price $48.00 f. o. b. Toronto

stand quietly, usually covered with a cold sweat, pulse imperceptible at the jaw, breathing frequent, and usually sighing. To the uninitiated these symptoms indicate an improvement, but they really indicate that the inflammation has terminated in mortification and the approach of dissolution. In some cases there is retching and attempts to vomit. He will usually stand thus until he begins to stagger, and at last falls and dies with a few convulsive struggles. In other cases the symptoms of pain endure until the last.—J. Hugo Reed, V. S.

PROPPING THE ORCHARD

Most fruit growers are not so careful as they might be to prevent limbs of trees from breaking when they are carrying heavy loads of fruit. In some districts, however, propping of some sort has become regular orchard practice, even though the fruit is thinned regularly.

"Four methods of propping are used by the orchardists: The center ring and wire, the cross wire, the center pole and wire, anad the single pole.

"In the centre ring and wire method screw eyes are placed in the main limbs at some distance above the crotch of the tree. Wires are attached to the screw eyes and brought to a ring placed approximately in the centre of the tree. This holds the tree in shape and prevents the breaking of the limbs at the time when the crop is on.

"In the cross-wire method screw eyes are placed in the main limbs at some distance above the crotch. From each screw eye a wire extends and is attached to a limb opposite or nearly so. This answers the same purpose as the former method.

"In the center pole and wire method screw eyes are placed in the main limbs, to which are attached long strands of wire. At the end of each stranad is a loop which is placed over a nail driven in the end of a pole. This pole is raised to a position nearly parallel to the trunk of the tree and set. This draws the wires tight, holds the tree in shape and prevents the limbs from breaking.

"The single-pole prop method is most common. This single pole usually consists of a one-by-two-inch or one -by-four-inch pine strip, varying in length as conditions demand. The eight to twelve foot lengths are most commonly used.

These props are usually sharpened at one end so as to make it easy to place them in the ground. The end which is to hold the limb is V-notched, or small lath strips are tacked on each side of the prop, practically forming a anotch.

There are three methods of single-pole propping in common use: First, one crew may haul and scatter the props through the orchard, while another crew sets them up; second, a crew may haul the props out and set them as they go; third, the props may be hauled out and set up as needed. Sometimes an orchardist may carry out and set them as needed.

SILO FACTS FOR LIVE STOCK FARM

Here are some of the reasons why the farmer should have a silo:

1. The silo preserves the palatabilit yand succulence of the geren corn plant for winter feeding.

2. It helps to make use of the entire corn plant.

3. The silo increases the live stock capacity on the farm.

4. Silage is a good summer feed when pastures are short.

5. Because of the small amount of ground space required by the silo, it is an economical means of storing forage.

6. The silo prevents waste of cornstalks, leaves and husks which contain about two-fifths of the feednig value of the corn plant.

7. The silo located near the feed manger is an assurance of having feed near at hand in tsormy as well as fair weather.

Two Cents a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word, each insertion. KEEP RAIN WATER CLEAN

Instead of placing the rain water barrel outside the shed or barn, where dust and leaves can blow into it, and mosquitoes breed on its surface, why not put it inside the building and bring the water from the gutter down through the side of the building into the barrel? The water can then be used for stock on a rainy day without going out in the wet.

Conserving the Farmer's Greatest Asset in Maintaining Soil Fertility

From the beginning of agriculture, the fetrility of farm soils has been chiefly maintained by the application of manures. The real value of manures and their effect upon the soil were not known until quite recently, and, even now, we are probably just beginning to understand the manifold ways in which manure works this improvement. The principal value of manure was thought to be in the plant food it contained. It has even been said by some that, since a ton of stable manure contained say from $2 to $4 worth of nitrogen, potash and phosphoric acid, the same amount of plant food could be purchased and applied more cheaply in the form of commercial fertilizer. This may be true as regards plant food, but the conclusion must not be drawn that commercial fertilizer can take the place of manure. From the analyst's point of view, a ton of manure may be worth $2 to $4, but from the farmer's point of view, it may be worth several times that amount, because the farmer knows that he cannot, with the amount at which the plant food in the manure is valued, buy artificial fertilizer that will give the results on most soils that are to be obtained from the use of one ton of manure. Manure benefits the soil in other ways than by adding plant food.

Manure Improves Texture of the Soil.—The chief value of manure on many soils is its beneficial effect upon the texture of the soil. Most farm soils contain large amounts of plant food and the cause of unproductiveness is often that the soil is in a poor condition of tilth. One of the great functions of manure then is to so change the texture of the soil, that the plant can more readily use the plant food in it. When thoroughly incorporated, it loosens a heavy soil and has a tendency to bind together light, leachy soils, making both warmer, more pliable, more retentive of moisture and generally more congenial to plants.

Bacteria in Manure.—Aside from the humus it adds, manure benefits the soil in still other ways. It contains countless numbers of bacteria that are beneficial to the soil. When the vegetable matter contained in the manure rots in the soil, certain acids and ferments are produced which influence the supply of available plant food. All this is in addition to the plant food value of manure. The influence of commercial fertilizers is due almost solely to their supply of plant food; farm manures influence all soil conditions which are essential to the production of profitable crops. Farmers must learn to rely more and more upon nature's provisions for maintaining fertility, viz., farmyard manure and the returning of plants to the soil.

Value of Manure.—According to recently published figures, the value of animal manure produced annually in the United States amounts to $2,225,000,000. Reckoning on this basis, we find that in Canada there is produced annually animal manure worth over $200,000,000. This is only a by-product on the farm, yet it is the farmer's greatest asset in the maintenance of soil fertility.

COMPOSITION OF FRESH EXCREMENT

One Thousand Pounds of Fresh Dung Contain:

	Water	Nitrogen	Phosphoric acid	Alkalies
	(lbs.)	(lbs.)	(lbs.)	(lbs.)
Horse	760	5.0	3.5	3.0
Cow	840	5.0	3.5	3.0
Swine	800	6.0	4.5	5.0
Sheep	580	7.5	6.0	3.0

One Thousand Pounds of Fresh Urine Contain:

	Water	Nitrogen	Phosphoric acid	Alkalies
	(lbs.)	(lbs.)	(lbs.)	(lbs.)
Horse	890	12.0	0.0	15.0
Cow	920	8.0	0.0	14.0
Swine	795	3.0	1.25	2.0
Sheep	865	14.0	0.5	20.0

COMPOSITION OF ONE THOUSAND POUNDS OF DRAINAGE LIQUORS

	Water	Nitrogen	Phosphoric acid	Potash
	(lbs.)	(lbs.)	(lbs.)	(lbs.)
Drainage from gutter behind milch cows	932	9.8	2.4	8.8
Drainage from manure heap.	820	15.0	1.0	49.0

Much Carelessness in Caring for Manure.—On account of manure being a by-product, it is not given the care and attention which the so-called principal products of the farm receive. The Commission of Conservation has found by actual investigation on 3,000 farms in Canada that the majority of farmers exercise no special care to prevent waste of manure. In 1916, the Commission of Conservation visited 400 farms in Dundas county and learned that very few of these had manure sheds. Proper manure pits or cellars are almost unknown. Less than one per cent of the farmers visited saved all of the liquid manure, while 90 per cent of the farmers admitted that they exercised no special care to prevent the waste of manure. This means that fertilizing elements to the extent of millions of dollars annually are being lost in Canada and that many thousands of dollars are lost in this way in the county of Dundas. What would we think of a farmer who would wilfully allow some of his live stock to wander away and become lost, or who would not mend a hole in the granary floor, through which he knew grain was leaking out and being lost? In these times of stress and food shortage, careless waste of anything that will contribute toward increased production is decidedly unpatriotic. Every pound of plant food in the shape of manure should be jealously guarded and used on the land. Every avenue of waste and loss should be closed.

How Losses Occur.—Losses occur principally from super-heating or fermentation, leaching, and the escape of liquid manure. A common sight in Dundas county is a manure pile beneath the eaves of the barn. Water from the roof drips upon it, rains and snows beat upon it, winds dry it. After the rain, dark puddles will be seen in the yard, or, if the land is sloping, dark streams will be seen carrying off the richness that has leached from the piles. The very best part of the plant food contained in the manure is carried away in this manner. It is the portion which is most quickly soluble, hence the most readily available to the plant when the manure is mixed in the soil. In dry climates, the loss from leaching would not be so great, but in Dundas county where the annual precipitation is large, the loss is very considerable and should set every farmer thinking how to prevent it.

Loss from Fermentation.—Another way in which manure frequently loses value is by heating or fermentation. When it is piled deeply and loosely so that the air can enter the pile, it begins to heat and decay. Horse manure is especially apt to heat quickly. This fermentation is caused by the growth of bacteria which need heat and air. If the air can be kept from entering the pile by closely tramping and packing it, less fermentation will take place. Nitrogen in fermenting manure is rapidly changed into ammonia which escapes into the air. Everyone has noticed the decided 'smell' of a manure pile that is heating. It denotes that plant food is escaping. The heating of manure burns a part of the vegetable matter which would have become humus when applied to the soil. The hotter the manure becomes, the greater is the loss of the humus-making material.

How to Prevent Loss by Heating.—This loss occurs only when manure is piled so that the air passes through it readily. Compacting the manure by tramping will do much to prevent this loss. Keep as much of the liquid manure mixed with the solid as is evpedient. Another method of preventing heating is to mix the cold and hot manures together, that is, the cow manure and the horse manure. Do not allow the pile to become too high, keep the upper surface even. If fermentation is beginning, it can often be checked by mixing a small amount of fresh manure with that which is fermenting.

Loss from the Escape of Urine.—Another loss is caused by failing to save the liquid portion. The liquid contains more nitrogen and more potash than the solid dung, yet in many cases it is allowed to run to waste, while the solid portion is more or less carefully saved. The plant food in the liquid portion is immediately available to plants when the manure is applied to the soil and should be saved and applied to help the young palnts to get a good start.

How to Care for Manures—Leaching usually causes a greater loss of plant food than either fermentation or the escape of the liquids. There are two ways of overcoming the loss from leaching: by hauling the fresh manure from the stable and spreading it directly upon the land; and by properly piling it under cover. Drawing the manure to the fields as made involves the loss of less fertility than is usually suffered from storing it and is the most satisfactory method whenever it is expedient. Some farmers think that there is a considerable loss when manure is spread on the snow in winter time. Careful experiments have shown that the loss is much less than is generally imagined and manure may be drawn out and spread in winter time, unless the land upon which it is being applied is too steep or the snow becomes so deep as to prevent this being done. It is usually necessary to store at least a portion of the manure. When this has to be done, it should be piled under cover in order to prevent the rain from leaching through it. A single heavy shower in the summer may carry away enough plant food from an uncovered pile of manure to pay for a large share of the cost of the manure shed.

Another method is to build shallow, covered cement pits into which the manure is dumped and into which the liquid manure is allowed to drain. The pit should be big enough to hold several week's supply of manure or as

(Continued on page 156)

Feeds will be High in Price

New York Advices are That Market Has Stiffened on Oil Cake--Allies Buying Largely--United States After Canadian Feeds

The feed situation promises to be more acute than for months past. Already the increased European demand is having its effect on oil cake meal prices. There has been a sharp advance at New York and agents of the Allied governments are buying heavily. The call for feeds in Europe is unprecidented, and with the increase in the amount of available ocean tonnage, there will be heavy exportations to Europe.

In Canada, Unit d States buyers are very active. Recently the Canadian food controller was offered 7,000 tons of special feed, made from sugar beets by the Dominion Sugar Company, of Chatham. It was offered at $35 per ton f. o. b. Chatham. It tests 8 per cent protein and one-half per cent fat. Orders for this feed will be accepted by the Dominion Sugar Company. It is worthy of note that United States buyers have offered to take the entire lot at $40 per ton, f. o. b. Chatham, and it is probable that the owners will be allowed to export it. The food controller first insisted that it be offered to Canadians, who have not seen fit to take advantage of the offer.

Special Feeds

In special feeds, the Maritime Farmer will supply agricultural societies at cost. Reports from all sections, with few exceptions, have been most favorable in regard to Ground Special feed, which we offer at $32.00 pr ton f. o. b. Fort William. It contains 13 per cent protein and 4 per cent fat. The cost per unit is about $2.40 delivered to Maritime Province points. We are basing this estimate on a freight rate of $8.80 per ton. Some feeds are being sold in the Maritime Provinces at $4.50 per unit of fat and protein and even at higher prices. The Maritime Farmer would that it might bring home to every buyer of feed, the wisdom of insisting upon getting the analysis of feed before buying. When you get that, add the protein and fat contents together and divide the result into the price you are being charged. This will give you the unit cost. Then compare it with the price of Ground Special and see how much more you are paying. In the case of Molasses Dairy which tests 17.36 protein and 4 fat, the cost per unit is only $2.37 per unit. This is an exceptionally good dairy feed. It is sold at $42.00 per ton f. o. b. Fort William. We have added $8.80 per ton for freight in order to arrive at above figures. Molasses Hog feed sells at about $60.80 New Brunswick points and slightly higher in Nova Scotia and Prince Edward Island. It costs about $2.50 per protein-fat unit. Compare the price with the retail prices you are paying. It will make you wink to see the difference. Where the saving is only 50 cents per unit, it means a cash saving on a car of feed of $250.

COMPARATIVE ANALYSES

	Ground Molasses Special	Ground Molasses Standard	Hog Feed	Molasses Dairy	Bran Avrg.	Std. Midds. Average
Protein	13.31	14.36	17.26	17.18	14.91	17.09
Fat (Ether Extract)	4.00	4.92	5.39	4.05	3.99	5.33
Crude Fibre	18.81	10.32	13.97	15.82	12.43	10.89
Carbohydrates	64.11	67.96	69.67	57.53	63.50	62.23

Is This Worth Saving?

Is the saving of $250 on a car of feed worth while? We believe that most buyers of mill feeds will agree that it is and be inclined to insist on buying only that feed which they consider has value to the extent that they are asked to pay for it. The use of feeds made from elevator screenings is not an experiment by any means. For years United States buyers have been coming to Canada and buying these screenings. They have been sold there for years. Only when the scarcity of mill feeds in Canada became acute, were steps taken to save these valuable feeds for home consumption. At Fort William a mill was erected at a cost of three quarters of a million dollars and to-day feeds are being produced from elevator screenings, which have a high feed value.

In the winter of 1914-15, extensive experiments were carried on by the Animal Husbandry Division of the Central Experimental Station at Ottawa, with a view to determining the comparative feeding values of meals and elevator screenings. The results, published by the Central Experimental Station, establishd that the use of feeds from elevator screenings were not only practical but highly profitable. In the United States splendid results have been obtained.

Will not use Bran or Shorts

During the present season, the Maritime Farmer, delivered large quantities of these feeds to farm organizations in the Maritime Provinces, and with excellent satisfaction to those who have used them. Some of the best feeders in Sussex, N. B., probably the centre o fthe most extensive dairying section in the Maritime Provinces, have bought large quantities of Ground Special. James J. Jeffries, Harry Manning, Albert Bonnell and many other large milk producers have not only been satisfied, but declare that they are getting fine results from this feed. In fact, some farmers have declined to buy shorts and bran, preferring Ground Special to either or both. They save money by purchasing the elevator screenings feeds and their stock is producing well on them and building up.

Agricultural Societies may secure these feeds through the Maritime Farmer at cost. They are shipped car lots of twenty five tons. A bank guarantee that the draft will be paid on presentation must accompany the order. A form for this purpose will be sent on application. Not only this year, but in the years to come, the Maritime Farmer hopes to save many dollars for these organization, who are sufficiently wide awake to co-operate. If you are interested in these feeds, or in bran, shorts, flour, oats, or hay, write us. We will give you our quotations. But please remember that quotations on many feeds are for one day only. If you want to get an order in, get it along quickly.

For the information of those interested, the prices and analyses of elevator screenings feeds are given above.

The N. B. Breeders Consignment Sale

The first Annual Breeders' Consignment Sale of Registered Live Stock held under the auspices of the New Brunswick Department of Agriculture and the Live Stock Breeders of the Province, was held in the Exhibition building, Fredericton, on November 21st.

Upwards of one hundred head of horses, cattle, sheep and swine, as well as a number of pure bred Barred Rock cockerels were lined up for sale.

Mr. Alex. Brewer, Keswick, acted as auctioneer. The ring committee consisted of Mr. A. E. Trites and F. L. Fuller, President and Secretary respectively, of the Maritime Stock Breeders' Association, and Thos. Caldwell, Florenceville. This trio of gentlemen had gone over all the stock offered previous to the hour of sale. They received the consignors upset prices, so that there would be no risk of the stock being sacrificed. The sales were bona fide throughout, each and every animal being knocked down to the highest bidder, providing the breeders upset prices was attained.

The valuators report that in every case they found the breeders quotations most reasonable and a general spirit of co-operation prevailing to help make the sale a success. Many of the prices quoted were considerably lower than the respective breeders would ask for the various animals at their home stables. The breeders realized that this was the first sale of the kind attempted in the province and each and every one of them were willing and ready to get it away to a good start, even if they sacrificed a few dollars by so doing.

The sale was originally planned for November 7th, but owing to the influenza epidemic and the consequent ban on public gatherings of all kinds, the sale was postponed indefinitely, as there was no knowing how long the ban conditions would obtain.

With the lifting of the ban came the selection of November 21st, as the sale date. As the season was getting late it could not be deferred any longer. The time between the date of notice and the date of sale was necessarily rathr short for an extended advertising campaign, but we believe the prospective buyers had their ear to the ground, and keenly watched for the announcement of dates through the public press.

Quite a number of prospective purchasers on learning that the sale was postponed until the ban would be raised, and not knowing whether it would be on for two weeks or two months, got busy and purchased their requirements direct from the breeders.

Then the Victory Loan took a lot of the loose cash that farmers who might not want to purchase an animal very abdly, who would be ready to recognize values and take a chance.

The weather man also did his best to keep down the attendance, as there was a steady downpour of cold rain almost up to the time of sale.

There was no demand for horses. No one seemed to bid even the reasonable figures quoted by the respective consignors.

The first animal sold was the yearling Holstein Bull, Faforit Champion, contributed by Harding Bros., Welsford. This youngster was first in his class and Junior Champion at Three Rivers and Quebec City shows last fall. His dam gave 55 pounds of 4.1 per cent milk as a heifer with first calf. His sister has a yearling record of 20,000 pounds milk and 811 pounds butter as a four-yar-old. The dam of Faforit Champion's Sire has a seven day record of 24 pounds butter and the grand-dam has 24 pounds of butter to her credit in seven days, as well as over 100 pounds of milk in one day. A Quebec breeder wired a $500 bid for Faforit Champion, having seen him at the shows last fall. Mr. Arnold Carpenter, Carpenter, N. B., the successful bidder, is to be congratulated in securing this combination of show and producing quality.

Red Archer, a Shorthorn yearling bull, contributed by R. A. Snowball, Chatham, was sold to The Centreville Agricultural Society, Carleton County, at $155.00, the highest figure realized for Shorthorn males.

The highest price realized for a Shorthorn female was $220.00 for Ruby, a seven year old cow, contributed by P. R. L. Fairweather, Rothesay.

Springbrook Prince George, contributed by McIntyre Bros., Sussex, headed the Ayrshire Bull class at $300. The purchaser was L. J. Donovan, St. John. This two year old bull is out of the cow Mona D., several times a winner in the Dairy Test at the Maritime Winter Fair, Amherst. Mona D. has given as high as 63 pounds of 4.8 per cent milk per day in official test. Springbrook Prince George is by Morton Mains Amanth, an imported bull that for several years was champion at Halifax, Fredericton and Chatham exhibitions. A clean bill of health went with every animal offered by Messrs. McIntyre Bros.

A magnificent flock of well fitted Cheviot Sheep, consisting of one ram and nine ewes, recently imported from the State of Maine, was knocked down to Geo. King, Sussex, for $615.00. Mr. King is a son of John H. King, now and for many years a breeder of Shropshire sheep. He is a young man who heard his country's call and who, having done his bit and after being wounded, was invalided home. This Cheviot flock is by far the nicest combination of the breed we have ever seen imported to the Maritime Provinces. In the hands of Mr. King they should be heard from later.

Several animals withdrawn from the sale ring on account of insufficient bidding we understand, were afterwards sold by private sale.

While the sale cannot be classed as an unqualified success, yet it was not a failure by any means when one considers the influences that mitigated against it. The breeders who contributed stock feel the sale was a move in the right direction and one that may well be tried again when we trust conditions will be more favorable.

Following is the list of the sales:

Shorthorn Males

Red Archer, 118053, contributed by R. A. Snowball, Chatham, N. B., sold to Centreville Agricultural Society for $155.00.

Snowabll, 121383, contributed by L. M. Anderson, Sackville, N. B., sold to D. M. Seeley, Maugerville, N. B., for $100.00.

Island Chief, 119375, contributed by L. M. Anderson, sold to Burton Agricultural Society, Burton, N. B., for $100.00.

(Continued on page 154)

W. R. Reek Appointed to Responsible Post

Head of New Brunswick Department will be Assistant Live Stock Commissioner for Canada--Has Assumed Office.

MR. W. R. REEK,

has accepted the position of Assistant Live Stock Commissioner, Ottawa

William R. Reek, secretary of New Brunswick Department, was ed to fill the important position of Assistant Live Stock Commissioner for Canada. On Thursday he left for Ottawa, accompanied by his family, and has already entered upon the discharge of the duties connected with his new post.

Mr. Reek's removal from the province will be a distinct and positive loss to agriculture in the Maritime Provinces. He came first to eastern Canada as the representative of the Dominion government agricultural branch at Ottawa. Later he assumed the control of the P. E. I. department, and under his guidance, reforms were introduced which have placed the Island at the forefront of the Maritime Provinces, in some aspects of its agricultural policy. Mr. Reek did things. And when he departed from Charlottetown to accept an important appointment in the agricultural department of his native province, he left behind him, in the changes he inaugurated, a legacy which has meant hundreds of thousands of dollars to P. E. I. farmers.

Mr. Reek's Ontario stay, however, was to be of short duration. When the present government sought a suitable man to fill the office of secretary of agriculture, they sent for Mr. Reek. After some negotiations, he accepted the provincial offer. There are few farmers, who have met Mr. Reek, who will not agree that he was a most capable official. He gathered about him a staff selected for the individual ability of each of its members. Political considerations were ignored by Mr. Reek, and he brought together a staff of young men, every one of whom is a worker, and each of whom knows the business of the particular branch in which he is engaged. Mr. Reek is a tireless worker and he enthused his following with his own aggressive policies. He did not spare effort by himself and he insisted that others follow his unselfish lead. He leaves behind him an organization which should accomplish much for agriculture in New Brunswick. That he held the esteem of those with whom he was associated was evidenced by the presentation to him of an address and a handsomely appointed travelling toilet set.

Mr. Reek, in his new position, will not be altogether lost to the province by sea. His duties will necessitate his prsence here during each year and he is expected to spend the early months of the new year at Fredericton. At Ottawa, he will doubtless bring to bear on his new department the sound judgment and industry, which enabled him to do such useful work in the east. Mr. Reek has thousands of friends in this part of Canada, whose best wishes he carries with him. They will follow his career with interest. That New Brunswick has sustained a loss is generally admitted. The Maritime Farmer adds its "good luck" to that of Mr. Reek's many other friends.

No successor has yet been appointed to fill the vacancy, but Mr. M. A. McLeod is acting secretary.

N. B. F. & D. A. EXECUTIVE PLAN 1919 PROGRAMME

The executive officers of the New Brunswick Farmers and Dairymen's Association assembled in the capital city on the evening of the 20th ult., to arrange a programme for the annual convention of the Association which will be held in February or March, 1919. We understand a good bill of fare is mapped out with ample room for discussion. The dates will be announced at a later date. In the meantime Agricultural Societies will appoint their delegates and instruct them to bring any matter of interest by resolution regularly before the Association for discussion and action. Let the next session of the Association be a live one—one that will in no uncertain terms voice the sentiments of the farmers of the province or matters of general interest.

nnual Meeting of Agricultural Societies United

Organization will have Plenty of Fertilizers--- Saving by Unmixed Goods About Twenty Dollars Per Ton

e annual meeting of the New swick Agricultural Societies Unit- as held at the Normal School ng, Fredericton, on Thursday the inst. The President, W. H. e occupied the chair. Those pre- and representing agricultural soc- were Boyd K. Merrill, DeWolfe, 64; Albert Wood, Coverdale, No. Arthur S. Jewett, Douglas, No. Fred H. Fowler, Chipman, No. 90; Huggard, Norton, No. 74; Ludlow Prince William, No. 38; W. B. n, Kingsclear, No. 147; C. M. , Peoples Union, No. 132; Roy in, Florenceville, No. 126; S. B. ht, Andover, No. 46; and H. B. Durost, Woodstock, No. 1; J. D. McKenna, Sussex, No. 21.

The financial statement for the year was read and adopted.

The following officers were elected for the ensuing year:

President—W. H. Moore, Scotch Lake.

Vice-President—Charles M. Shaw, Hartland.

Secy. Treas.—J. D. McKenna, Sussex.

Directors—J. Roy McCain, Florenceville; S. B. Wright, Andover; R. J. Huggard, Norton and Boyd K. Merrill, Moore's Mills.

An outline of the goods to be offered and prices was given to the meeting and the announcement that the Agricultural Societies United were saving by the sale of unmixed goods, as compared with mixed goods, twenty dollars per ton, on the average. It was suggested that all societies order promptly. Difficulties with transportation are expected and it was pointed out that fertilizers should be brought in as soon as possible. All information will be gladly given by the secretary-treasurer, J. D. Mcenna, Sussex.

Mr. E. M. Taylor, of the department of agriculture, Fredericton, addressed those present on the use of unmixed goods. A hearty vote of thanks was tendered Mr. Taylor for his assistance on this and other occasions.

New Brunswick Live Stock Breeders Organize

Wednesday evening preceding onsignment sale of live stock in ity of Fredericton, a number of sentative breeders assembled in ymnasium of the Provincial Nor- School to organize a New Bruns- Live Stock Breeders' Association, e aim will be to co-operate with Departments of Agriculture, local federal, and whose executive will s an advisory committee on live improvement matters with the rtment of Agriculture.

e live stock breeders of the prov- recognize that the Department of culture is putting forth an hon- practical effort in their behalf and behalf of the industry they repre- and feel that a closer co-operation exist through the medium of an ization of this kind.

. A. E. Trites, President of the time Stock Breeders' Association ded. The object of the meeting announced and heartily concurred all the breeders present, and the of organization was carried on.

It was decided that for the present an executive of seven would be sufficient and the following gentlemen were named to represent their respective breeds:

Horse—J. C. Jewett, Fredericton.

Shorthorns—R. A. Snowball, Chatham.

Holsteins—Thos. Harding, Welsford.

Ayrshires—A. C. Taylor, Salisbury.

Jerseys—J. H. Manchester, Apohaqui.

Sheep—Burder Goodwin, Baie Verte.

Swine—W. S. Harding, Hammond River.

These men will choose a president from among their own number, and Mr. Thos. G. Hetherington, Live Stock Superintendent for the province, will be secretary.

The Association was not many minutes in existence before the Scrub Bull problem got a jolt that will likely be heard discussed and acted upon at the next session of the New Brunswick Farmers' and Dairymen's Association. It will be well for all delegates to that Association to come prepared to make the jolt so severe that the scrub bull will be legislated off the highway and commons of this province without the necessity of complaints being made by one neighbor against another, or the alternative of using a sharp knife in the darkness. We also heard a gentle hint thrown out in regard to the scrub stallion. Scrub stallion owners may begin to get ready. The hand writing is on the wall and ere long the scrub stallion will go never to return.

GET THE MANURE INTO FIRING LINE

The handling of manure has always been regarded in most quarters as one of the evils necessary to farm work. If stable wastes were worth $25 a ton farmers would regard this part of their labor from another viewpoint and would see to it that in every way possible conservation of fertility elements should be guarded. For the sake of farming and those dependent for food upon what they produce, it is to be hoped so high a price may never be placed upon fertility. But with a valuation today so greatly in excess of what has been placed hitherto on fertility elements, the proper utilization of stable wastes becomes one of the primary factors in present day farming. No one can go far astray who keeps these wastes busy. At present valuations it is no time to haul manure simply when "one cannot do anything else." This is slacker philosophy. If need be, let certain other things wait. But get the manure into action on the firing line with the least delay.

When a man goes about bragging and boasting how good and wonderful he is and what great things he is constantly doing, the fewer people will shout his praises after he is dead. It is usually the humble quiet man who is kind and sincere; and such a man is missed from a community to the extent that people will continually speak of his virtues.

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

DECEMBER 3, 1918

DATES OF ISSUE.

December 3-17

BOOST YOUR NEIGHBORHOOD

There is one deligthful thing about farming which is not true of some other industries, and that is every farmer is really benefited by the success of his neighbors. In a progressive neighborhood, where good stock is kept and where farming is generally profitable, roads and schools are better, the price of farm land is higher, and owing to the fact that a great quantity of farm products is offered for sale, markets are better; so boost your neighborhood and your neighbors and by doing so help yourself.

SELECT YOUR SEED GRAIN NOW

The farmer who plans to select a quantity of seed grains in the field before they are cut and who in other ways follow the plan outlined by the Canadian Seed Growers Association, is looking well to his possibilities of reaping the most for his labors.

However, there are many farmers who do not make any attempt at seed selection in the field nor even at a fairly good fanning mill selection of seed grain. The grain goes to their seed drills as it comes from the threshing machine. The large, the small, the thin and plump grains, as well as all kinds of weed seeds are sown together to propogate their kind; but seldom if ever does the careless farmer of this class blame himself for poor harvest yields.

The grain has been threshed. From the threshing machine it has gone forth to the granary bins from which it will be fed out to the live stick on the farm.

Before any appreciable quantity of the grain is consumed, why not make a thorough fanning mill selection of the seed grain you will require for 1919, This is a rainy day job that pays handsome dividends.

SHEEP GREATEST ECONOMISTS AMONG THE FARM LIVE STOCK

A false idea that just at present is misleading some is that the sheep is a scavanger and does not need much good feed. It is true tht the sheep is very useful in turning weeeds and even brush into value, but a good supply of choice feeds should always be provided. The margin of profits will rise and fall just in proportion to this supply.

"In my own farming experience of over half a century," writes Geo. McKerrow, "I have found the sheep the greatest economist among my live stock. It eats over seventy-five per cent, of the weeds, gleans the grainfields after removal of the crop, utilizes the turnips and rape sometimes grown on these grainfields, crops the stray weeds and lower leaves in the cornfield just before it is cut, and in fact has been so useful that I would hardly know how to carry on a farm without a flock.

"Proper culling of the flock is economy that should be well looked after. All old ewes, those which raise their lambs poorly, and young ones of inferior quality, should be sent to market each year, and the best ewe lambs kept to improve and build up the flock. The only exception to these rules of culling is where an old ewe has proved a remarkable breeder and mother; retain her in the flock as long as she breeds well. But all of these good aged ewes should have extra feed and care winter and summer.

"In selecting the sire much can be done in building up an economically producing flock. A sire of medium size for the breed selected is better than the overgrown sport or the small fine-boned weaklin. He should be vigorous and active, compact in form, with well developed legs of mutton, wide loin and well sprung rib, good heart-girth, large eyes and wide nostrils, and at all times should be kept in good condition without being overgeshed.

"During service season he should have the best of care and attention an dnever be overworked".

FOUR COWS AND A $10,000 HIDE!

There'sa farmer in Ohio whose name is Peter Small made a mighty big mistake a few years ago. The mistake cost him over $10,000, says the H. F. News Bulletin. And all he has to show for it is a bump of experience and a lifeless hide.

Peter Small will never make the same mistake again. Peter Small did not swallow his loss and selfishly keep the story to himself. He was big enough to tell the dairy world, so that you and I and others would not lose as ne nad lost.

He took his hide to the Nationaal Dairy Show last year, and told the story of his mistake.

In the Peter Small exhibit there were five stalls. Four contained cows placidly chewing their cuds. In the fifth there hung the hide of the bull that had sired these cows. He had been slaughtered before Peter Small knew what his daughters could do. That was Peter Small's mistake.

He knows now. He kept a record of his cows after the bull was killed. He found that they averaged 25,210 pounds of milk, and 977.3 pounds of butterfat! And he had killed the bull that had sired them! He had killed for meat a bull that was worth at least $10,000. He had found out too late.

It was a lesson in cow-testing that cost Peter Small $10,000.

But the National Dairy Show gave it to the thousands of farmers, who attneded the show at Columbus last year for nothing.

THE FARMER'S PROFITS

Peter McArthur in the Toronto Globe says:—"Yesterady I received a letter from a correspondent who offered what he calls an unanswerable argument to show that the farmers are prospering in spite of the high prices of everything they have to buy. I think I have seen this unanswerable argument before, so it may be as well to answer it. He writes:

"Some years ago my father asked the price of an oil stove, and found that he could buy it for $12. This year he bought the same stove for $21. He figured out that when the stove cost only $12 it would have taken thirty bushels of oats to pay for it. This year the thirty bushels of oats will pay for the $21 and leave him about $5 to the good." My correspondent infers from this that the farmer's condition is improved to the extent of $5 in that transaction. In taking this view he is making a mistake very common among farmers. He has taken no account of the changed cost of producing the thirty bushels of oats. A few years ago I was able to hire a man during the busy season for $1.35 per day. This year similar labor costs $3 per day. This year my seed oats cost me three times as much as they did several years ago. If my correspondent would figure up the increased cost for seed grain, and the labor at seeding time, harvest and thrashing, he would find that the surplus of $5 would go glimmering. There is little value in an illustration of this kind for it can be used in many ways. Thirty bushels of oats will not go so far today in buying shoes, matches, the best kinds of clothing, and a lot of other things. But they will go farther in railway fares, paying old debts, paying the preacher's salary and similar ways. Of course, there is a lot more money in the country today than before the outbreak of war, though it is doubtful if its purchasing power is all that it should be. Still, that doesn't matter for some people.

EFFECTING REPAIRS

Implements should be kept under cover. Necessary parts should be procured without delay so that repairs may be effected during the stormy days of winter when it will not be seasonable nor advisable to attempt out of doors work. The practice of looking around about the time they are required in the field is a time waster. Man, machinery and power must be in readiness to take to the fields at the very earliest possible chance, when the seeding season arrives. Time lost effecting repairs at that season that could have been attended to in mid winter causes delay, consequent loss and less returns for ones labors.

* * *

Do not cross breed for best results in dairying. Get good grade cows and breed to a pure bred bull of the same breeding.

* * *

Systematic, well planned methods of management and work are sure handmaids of success in the dairy business as well as in any other vocation.

* * *

Comemricial fertilizers are high in price and difficult to procure. On every farm where live stock is kept a great deal of manure containing the plant food elements that cost so much when purchased as commercial fertilizers, is produced. Strange to say, however, too many farmers pay little or no attention to this gold mine of the farm and consequently the plant food value of the manure is greatly reduced before it is incorporated with the soil. The better care of the manure produced on the farm will stop one of the big leaks in the fertility of the farm.

)MMON DISEASES OF THE DI-GESTIVE ORGANS OF CATTLE

(By J. Hugo Reed, V. S.)

(Continued)

Impaction of the Rumen

Cause.—Impaction of the rumen is e of the most common diseases of e stomach of the ox. It consists in stension of the rumen with solid atters. It is a pathological condition mewhat similar to tympanitis, but ffering in the urgency of its symp-ms and the method of treatment. It pends upon introduction of solid atters to such an amount as to par-lly or wholly paralyze the organ by er distension. Some foods appear ore liable to cause the disorder than hers, as grain, chaff, or potatoes. t any thing particularly palatable to e animal may be consumed in such antities if opportunity presents it-f. Sudden changes of food, espec-ly is the change be to a food partic-arly palatable, overfeeding on grain thout allowing the animal to take ercise, indigestible food such as er-ripe hay, food of poor quality en if consumed in only moderate antities, may cause the trouble; the imal continuing to eat, but not rum-ating sufficiently, the amount if in-st a gradually increases in the ru-en. This distends its walls until ey become partially paralyzed; nce the normal contraction and re-xation does not take place, and the rmal churning motion is absent. We quently notice a case of impaction thout appreciable cause, which, no bt, is due to a temporary suspen-n of the action of the walls of the gan, or a failure in action of the nds, for which we can give no ase.

Symptoms.—The animal becomes ll and suffers pain, which is often pressed by stamping of the feet, iking at th eabdomen with the hind t, switching the tail, etc. The se is frequent, and the respirations ually accelerated. Appetite is lost l rumination suspended. The bow-are usually constipated. The ab-men is enlarged, especially on the t side , but this does not occur so ickly as in tympanitis; neither is it the same nature. When tapped ween the point of the left hip and last rib a dull sound is produced. l when pressed it has a doughy l, and the imprints of the fingers not quickly disappear—when the mal is lying down—especially if ng upon the left side, a position t is seldom maintained for any con-erable time. In the later stages mpanitis often sets in as a compli-ion when, the resipration becomes re labored, the grunt during expir-on more pronounced, in some cases embling a groan rather than a nt. The patient often grinds his th and persists in standing with truded muzzle and arched back. In ne cases inflammation of the rumen ults, when there will be a well-rked increase of the temperature l the patient wil lmanifest pain if ssure be made on the left side.

The foregoing symptoms are more less well-marked in severe cases. in cases of less severity the pat-t occasionally appears to have per-s of ease and expresses a desire food. If food be allowed he will a variable amount with apparent ish, but the symptoms of illness n become more marked than be-e. This is of necessity the case, the walls of the rumen are more or s inactive and the mucous glands o are in a state of partial inactiv-; the organ is not performing its per function and the introduction r fresh supply of food must inten-r the trouble.

Treatment must be directed to the moval of some of the impacted food ss and the resoration of activity to over-distended walls of the rumen. en the distension is not excessive brisk purgation of 2 drs. Epsom gs, ½ oz. gamboge and 2 ozs. ginger about 1½ quarts of warm water should be given as a drench. This is a fair dose for an ordinary sized cow, the dose for smaller or larger animals should be in proportion to size. In order that the purgative may act it is necessary that the paralysis of the walls of the organ be overcome. For this purpose nerve tonics, as nux vomica in 2 dram doses (for an ordinary sized cow) should be given every six or seven hours. It is not wise to allow the patient any solids to eat until there is a free action of the bowels. If he expresses a desire for food a little bran mash may be allowed. If purgation has not commenced in 36 hours more purgative medicine should be given. About 1½ pts. of raw linseedoil should be given and alternated every twelve hours with 1 lb. Epsom salt and 1 oz. ginger, until purgatino is established. The administration of nux vomica should be continued in the meantime. The patient should be allowed all the water he will drink. If the weather and surroundings be cold it is wel lto remove the chil lfrom the water.

It is remarkable how stubborn some cases are, the length of time an animal will suffer and the quantities of purgative medicines it is necessary to administer before an improvement is noticed. If the disease is not yielding to treatment after the second day it is necessary to give the patient something to sustain strength. Probably for this purpose nothing acts as well as boiled flax-seed administered as a drench in about quart doses four or five times daily. This is laxative, saathing and nutritive.

So long as tympanitis does not occur the probability of successfull treatment may be looked upon as hopeful. If it occurs the usual treatment for bloating must be followed in addition to that already noted. In cases where the early symptoms of the disease are extreme an operation called "rumenotomy" is necessary. This consists in cutting through the skin, muscles and wals of the rumen and removing a large portion of the contents by hand. The operation can be successfully performed only by a veterinarian.

What is commonly called "Grain Sick" is simply impaction of the rumen with grain. When an animal is known to have had the opportunity of eating excessive quantities of grain, the usual custom of shutting him in a stable, alolwing him neither food nor water, and awaiting developments is absurd. The owner should anticipate trouble by a tonce administering a brisk purgative, as for impaction. Allow him nothing to eat, but allow all the water he will drink in small quantities and often, in the hopes that purgation will commence before the grain swells and causes paralysis of the walls of the rumen. Of course, in cases of "grain sick" where the early symptoms are severe, rumenotomy should be performed at once.

Fardel Bound

Causes.—Fardel bound is the name given to a pathological condition which consists in impaction of the omasum or third stomach. It is also known as maw bound, vertigo, staggers, etc. The ingesta becomes impacted between the leaves of the organ. It is sometimes followed by inflammation of the stomach. It is a much more serious condition than impaction of the rumen. The contents of the omasum are normally drier than those of any other compartment of the stomach, but when this disease is present they become very dry, so dry that in some post mortems it has been observed that they will burn if lighted with a match. The disease is caused by introduction into the stomach of food of an indigestible character, particularly that of a dry, woody nature, as autumn grass that has been allowed to remain in the field until spring, and is consumed in greater or less quantities by the cattle along with the fresh grass; over-ripe hay, poorly saved hay, straw, coarse and indigestible herbage sometimes found in old pastures, especially where considerable shade is found. Like other diseases of the stomach, it is often met with when no well-marked cause can be traced. It is difficult to treat and often proves fatal.

Symptoms.—The symptoms of fardel bound are not as typical as those of bloating or impaction of the rumen. In many cases ,in the early stages, fæces are passed frequently and in small quantities, in some cases in a fluid or semi-fluid state, and in others quite dry and hard. In either case obstinate constipation soon follows, the appetite becomes impaired or entirely absent, rumination ceases, the secretion of milk is more or less suspended (if the patient be milking), the muzzle becomes dry, and the eyes usually dull but in some cases wild looking. In rare cases delirium is noticed in the early stages, the patient becomes wild, more or less furious and hard to control. A short grunt is often noticed during expiration, especially when the patient is lying. This symptom is often noticed in cases of impaction of the rumen, but the condition if the abdomen, especially on the left side, is sufficient to enable a man to differentiate between the disease. Respirations are usually ferquent and short. The patient often persists in standing, but in some cases lies considerably on his left side with the head turned towards the flank. Pressure on the right side under the false ribs often causes pain. After a variable time there is usually more or les tympanitis, caused by fermentation of the contents of the rumen, in which digestion is also supended. As stated, delirium may be noticed in the early stages, in other cases it may occur later on, while in still others there is drowisness and stupor or partial paralysis more or less marked during the whole propress of the disease. The patient suffers acute abdominal pain.

Treatment. — Some recommend bleeding. Where the brain appears markedly affected the extraction of 4 to 6 quarts of blood from the jugular vein is good practice, but when the brain symptoms are not well marked blood letting is seldom parctised. It must be understood that there is paralysis, either partial or complete, of the muscular walls of the viscus and also of the muscular fibres of the manyplies, and that laxatives or purgatives will not act satisfactorily until this paralysis is overcome. The actions of purgatives are often very peculiar and disappointing. In a reasonable time after the administration of a purgatiive there generally are two or three slight liquid evacuations and the attendant thinks that free purgation has commenced, but these symptoms are often quickly followed by a return of the constipation. The administration of a brisk, saline purgative (as for impaction of the rumen) at first, is considered good practice by most practitioners. While in a general way the purgative action of aloes is very slightly marked in the ox, it is supposed to have a special action on the contents of the third stomach; hence it is good practice to add 6 to 8 drs. of aloes to the ordinary purgative, all dissolved in watre and given as a drench, care must be taken to not use hot water, as it will cause the formation of a waxy mass out of the aloes. Follow up with 2 to 3 drs. of nux vomica three times daily to overcome the muscular paralysis. Also give a stimulant of 2 to 3 ozs. sweet spirits of nitre, or a cupful of whiskey in a pint of cold water as a drench every four or five hours, and allow the patient all the cold water he will drink. If free pugartion has not commenced in twenty-four hours give 1½ to 2 pts. of raw linseed oil, continue the administration of nux vomica and stimulants and about every twelve hours until fre epurgation is established, give 1 lb. Epsom salt and 1 oz. ginger, and 1 to 1½ pints raw linseed oil alternately, i. e., give the saline dose and the oil alternately at intervals of twelve hours. If the patient will take a little food, allow reasonable quantities of bran mash with a little linseed meal, but no solid food. If he will not eat, some nourishment must be given after the second day in order to keep up his strength. For this purpose some practitioners recommend ale or stout, some recommend olt meal gruel, and some boiled flaxseed. Probably the last mentioned, given in 1 to 2 qt. dosesevery six hours, gives the best results. This has a soothing effect upon the irritated and more or less inflamed mucous membrane of the stomach, and also a laxative as well as a nutritive action. Treacle or black strap molasses is highly prized by some for the treatment of this and other diseases of the stomach, and is worthy of a trial. Treatment should be kept up until the patient improves or death results.

RECORDS AS AN AID IN FARMING

Is there any business that means a life's work that does not require records of some kind; is there any business more complicated than farming; are there more factors in any business that influence the final result than there are in farming? The farmer has nothing to say about what he shall pay for anything, and very little about what he shall receive for any of his products. He places all faith in kind Providence and her elments. Should he not also practice selection of profitable products, and a system of cropping or arrangement of production factors that mean economy of production? It seems that the time is not far distant when the farmer will have to know more of the inside of the business in a financial way than he has known or knows now. Indeed, all signs indicate this necessity.

Each farmer by figuring with known factors on his operations can eliminate the losing enterprises and concentrate on those that are profitable. It may be that co-operation and improved methods of marketing will increase farm profits, but the fact remains that some enterprises at that time will always be most profitable. These should be selected and this can only be done by the use of the records that record facts.

LIKES THE MARITIME FARMER

The following letter from one of the best known business men in New Brunswick, comes to the Maritime Farmer, unsolicited. It speaks for itself, and is as follows:

Dear Mr. McKenna:—

Enclosed find cheque for $4.00, being four renewal subscriptions for "THE MARITIME FARMER."

I wish to add my testimony to probably many others as to the excellence of your paper as a medium for exchange of views and purveyor of most valuable information among the farmers of the Maritime Provinces. It is so far ahead of any other periodical of its kind, in being so intimately connected and acquainted with the farming industry of this section of Canada and therefore of such help to the farmers here that I do not believe a farmer of these districts can afford to be without it. I have felt so enthusiastic in this respect that I believe it is only fair that you should know it.

Milking may be a simple operation, but not every one is a good milker. The cow is largely a creature of habit and should be milked quietly and quickly.

If there are some cows that are dry now, but are due to freshen early, it will be good policy to give them an allowanace of concentrates, as experiments have shown time and time again that the extra feed given to a cow while she is dry is again recovered in the increased milk flow after she freshens.

HORTICULTURE.

CIDER VINEGAR FROM CULL APPLES IS EASILY MADE

Good cider vinegar can be made on the farm by subjecting apple cider to a process of alcoholic fermentation by which the sugar in the apple juice is changed to alcohol, producing what is commonly called hard cider, and then subjecting the hard cider to a process of acetic fermentation by which the alcohol ic hanged to acetic acid. The acetic acid gives to vinegar its characteristic sourness.

Windfall apples which are not green or rotten, small apples, and any sound apples that cannot be marketed as fruit may be used profitably for vinegar making. Neither green nor rotten apples will make good cider or vinegar. Dirt, grass, leaves and any foreign substance, if allowed to get into the press with the apples, will not only injure the flavor but may retard the vinegar-making processes. The apples should be ground fine and then pressed slowly. As much of the juice as possible should be pressed out, but it is not profitable to add water to the pomace for a second pressing. The cider should be allowed to settle for a day or two in loosely stoppered barrels or other covered receptacles.

There are two well-known processes for converting hard cider into vinegar. One is known as the slow-barrel process. This is the simplest and requires the least work and attention, but has the disadvantage of requiring a long time for completion. The second method is known as the rolling generator process, which is more elaborate and requires daily attention.

Slow-barrel Process

The hard cider is carefully drawn from the containers in which the alcoholic fermentation took place in order not to disturb the settlings at the bottom, and passed into barrels for the final or acetic acid fermentation. The barrels should have been prepared by thorough cleaning and soaking with strong vinegar, and then placed on their sides with the bunghole up. They are filled about three-fourths full with the hard cider, and a few quarts of good vinegar are added to each barrel to hasten the change to acetic acid. The fermentation by which the alcohol of the hard cider is turned into acetic acid of vinegar now takes place. In order that this fermentation shall take place rapidly, it is necessary that the hard cider shall be in contact with the air, and for this reason the bungholes should be left open. It is well, however, to tack a piece of cheesecloth or of well-painted wire screen over the bunghole to keep out insects and dirt. Keep the temperature as near 65 degrees to 75 degrees F. as it is practicable. Fermentation should be allowed to proceed until good strong vinegar is produced. Such a vinegar can be recognized by its taste. It will contain not less than 4½ to 5 per cent. of acetic acid. The time required for fermentation is usually from 12 to 18 months.

After the proper strength of the acetic acid has been developed the vinegar should be drawn into barrels which have been cleaned thoroughly. Care shoulid be used to prevent the sediment in the bottom of the barrels from being transferred to new barrels. The barrels should be filled and tightly bunged and kept in a cool cellar. If vinegar is exposed to the air after the proper strength of acetic acid has been developed it loses strength, as the acid will be destroyed. By allowing the vinegar to remain in the tightly bunged barrels for three or four months it develops a fine mellow odor and taste, characteristic of the best cider vinegar.

Rolling Generator Process

When it is desirable to shorten the time required for converting the cider into vinegar the rolling generator process may be used. This process requires more work and attention than the slow-barrel process, but by providing for a greaterf circulation of air through the generator fermentation is hastened.

The rolling generator consists of a barrel placed upon its side with the bung hole at the top and divided by a slatted partition running lengthwise placed a little higher than the centre of the barrel. A few holes are bored obliquely downward, just beneath the slatted partition and ni both ends of the barrel. The purpose of these holes is to provide a circulation of air thriugh the generator. To operate the generator the upper part is packed with beech shavings or corn cobs and the shavings or corn cobs thoroughly soaked with some good, strong vinegar. The interir or the barrel should also be well rinsed with the vinegar.

The barrel is then filled nearly half full with hard cider and a few quarts of good fresh vinegar added. The barrel is mounetd on skids or trestles. All the air holes and bungholes are closed with plugs and then rolled so that the top (the bung side) is down, thus causing the cider to run into the shavings or corncobs. The barrel is then moved back to its proper position with the bung side up and all the plugs are removed. It is allowed to stand in this way while the cider drips from the shavings back into the the lower part of the barrel. As there is a circulation of air from the end holes through the shavings out of the bunghole the dripping cider comes in contact with the air and the process of fermentation is hastened.

The rolling of the barrel should be repeated two or three times a day, or more frequently, according to the convenience of the operator. As fermentation progresses considerable heat develops, and to obtain the best results the temperature of the upper portion of the generator should be regulated to about 85 degrees F. The temperature can ve lowered by inserting plugs to decrease the air current passing in at the end holes. To raise the temperature, increase the supply of air by removing some of the plugs. If the rolling of the barrels is attended to every day and the temperature maintained at from 80 to 85 degrees F., hard cider may be converted into good vinegar by this method from 60 to 90 days.

The vinegar may be aged in exactly the same manner as when made by the slow-barrel process.

WINTERING OF BEES IN ONTARIO

The beekeepers of Ontario lose each year from 10 to 50% of their colonies through winter and spring losses.

American bee literature is full of theories on the wintering of bees and on the causes of the losses therefrom. Many of these theories have been rejected or ignored. As the result of numerous experiments and a free interchange of ideas, however, successful beekeepers have evolved methods of wintering based on principles which recent scientific research has on the whole proved to be correct.

Beekeepers in Ontario adopt two methods of wintering. Some place their hives in a cellar and attempt to keep the bees inactive by controlling the environment factors, such as light, temperature, ventilation, etc., till the weather permits the bees to renew their summer activities. Others protect the hives o nthe summer stands, leaving the bees free to go out and to fly whenever the weather permits them to do so. Both of these methods, if intelligently carried out, give good results.

For outdoors wintering the hives are placed in collapsible wooden boxes the sides, of which are joined by cleats. Many beekeeepers place one hive in each box, others two and others four per box. In this last case two hives are placed facing west and two others facing east. Between the box and the hive is a space of 3 inches ad between the roof of the hive and that of the box a space of 8 or 10 inches is left. The box is placed on a solid stand 8 inches high which prevents draughts of air underneath.

The entrance holes are cut in the side of the box so that the bees may go out in suitable weather. The hives are packed for winter as soon as possible after the supers have been removed, and in October the bees are given a nabundant supply of maple sugar. The author gives the measurements of the different parts used for constructing wintering boxes, the size of which depends on that of the hives.

Till a few years ago the most common method of wintering in northern climates was that of keeping the hives in a cellar. Most beekeepers in Ontario and the northern States found that their bees wintered better in cellars than out of doors. Since the improvement of the method described above, however, outside wintering is generally preferred even as far north as New Ontario. Nevertheless, many stillprefer cellar wintering. The general conditions required for cellar wintering are:—(1) total darkness, (2) a uniform temperature between 40° to 45° F. The conditions are obtained most entirely underground as they are less subject to changes in out temperature. The air of the ce must be kept pure by a suitable s tem of ventilation, and must be ne er too dry nor too damp.

The hives themselves must h good ventilation; this may be ob ed by removing the summer co and placing on the top a layer of f a cushion of chaff, etc. The hives placed one above the other, those the bottom row resting on a stand least 1 foot above the cellar floor.

The hives are placed in the cel before the frosts, in southern On in the last days of November, a earlier in the northern districts.

Judgment must be exercised in t removal of the hives from the ce and the date depending on the co dition of the bees and on the seas The best time for setting them out the evening before or a day wh promises to be fine and calm, but n hot (60 to 70° F.) When such a d i sexpected the doors and windows the cellar are opened at sunset.

Directions are given for the pro tion of the hives in spring and f feeding the bees. There should be ample supply of food to avoid any da ger of starvation. Autumn is the be time for feeding bees for the follo

An Opportunity For Profit

The victory of the Allies, creates interest in securities classed as Peace stocks.

THE FFRUIT BRANCH

Mr. C. W. Baxter, Chief Fruit Inspector under Section IX. of the Inspection and Sale Act (Fruit Marks Act) for Ontario east of Toronto and the Province of Quebec, has been promoted to the position of Fruit Cmmissioner, succeeding Mr. Donlad Johnson, whose death occurred in August. Before entering the Government service in July, 1912, Mr. Baxter had spent his life i nthe frui ttrade. When first appointed in the service he was made chief fruit inspector for the Prairie Provinces, with headquarters at Winnipeg, which position he held until 1914, when he was transferred to Ottawa and given the eastern supervision. During these years he was closely associated with Mr. Johnson in handling the major problems relative to the distribution of fruit and vegetables. On the reorganization of the Food Administration, when the Canada Food Board succeeded the Food Controller, Mr. Baxter, while still an officer of the Fruit Branch, was placed in charge of the fruit ane vegetable section of the Board. On the completion of the licensing system an enforcement section was created and Mr. Baxter wa sgiven its charge. Mr. Baxter has entered upon his new duties as Fruit Commissioner.

Notice of Meeting

The annual meeting of the SHAREHOLDERS of the United Farmers Co Operative Co., N. B., Ltd., will be held in the Town Hall in the Town of Woodstock, in the County of Carleton Wednesday, December 11th, at 2 p. m. Make a special effort to be present. Important business.

Sec'y-Treas.

OILING HOGS FOR LICE

I have had a good deal of experience in oiling hogs and consider that good oil properly applied comes about as near being a panacea for the ailments of the swine family as anything that may be used. It is of much importance that the skin and hair of the hog be kept in a healthy condition, and there is nothing I know oi that will do this as effectively as good oil. In those cases where the skin is not in a healthy condition, the oil has a curative effect, and any lice or vermin preying on the animals are readily destroyed by it.

There are various ways for applying the oil and one which requires the least work on the part of the owner is the logical one to use. Some farmers who have a hog wallow simply pour a quantity of the oil on the surface of the water and depend on the scum of oil on top of the water coming in contact with the skin of the hogs as they wallow in the wallow. I do not like this method because too much oil is wasted and the hog is never oiled sufficiently to do him much good. Others apply the oil with a sprinkling pot, a spray pump, a brush or a broom, and I would rather apply the oil by one of these methods than not use it at all, but it is certainly no pleasant task to oil the hogs by hand, and there is always more or less waste of oil, besides the job is not usually done as often as it ought to be.

My hogs oil themselves by means of the patented hog oilers to be found on the market. The oiler consists of a horizontal iron roller, the bottom of which is submerged in a small resorvoir of oil. As the hog rubs against this roller there seems to be some kind of an inborn habit that causes him to revolve it in such a way that the oil coated surface of the roller rolls up against his skin and deposits oil on that part of the skin in contact with the roller.

The roller requires no attention except to keep oil in it, and there is no waste of oil. The oiler is so constructed that both large and small hogs can use, it, and I know they find enjoyment in doing so. The hog is a great conserver of energy and he will not do anything that does not make him feel more comfortable. The oiler can be set up anywhere or moved from place to place, and is ready for work at any time of the year. Whether one keeps few or many hogs he will nfid an oiler a good investment.

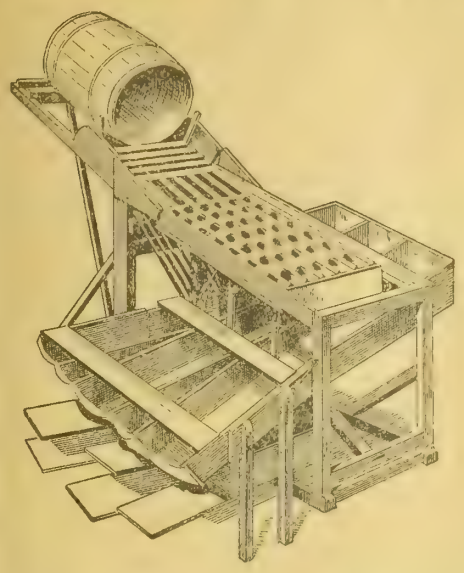
If, however, one does not buy an oiler, he should make some kind of an arrangement to oil his hogs at the minimum of trouble. This may be done by setting a post firmly in the ground and wrapping it securely with heavy strong burlap which is kept saturated with oil from an old pail or vessel of some kind fastened on top of the post. The burlap extends into this vessel and draws out oil on the principle of a lamp wick.

The kind of oil to use is a matter to be carefully considered. Ordinary crude oil is the cheapest and is used by some farmers, but there are some objections to its use. In hot weather it may burn and srark the skin for the same reasno that kerosene does this, as kerosene has not yet been entirely ditilled out of the crude oil. A neighbor of mine who used crude oil in his oilers, said that his hogs licked so much of the oil that it affected some of them in such a way as to cause them to act srazy. I am of the opinion that the gasoline in the oiler intoxicated them.

Another neighbor said that during a cold day in the winter he applied crude oil by hand to seven of his hogs and five of them died shortly afterward. The local veterinarian informed him that too free application of the oil in cold weather produced spinal congestion. The kind of oil I use is common luhricating oil. It has the same qualities of kililng vermin and disease germs that the crude oil has, and there is no danger in using it at any time of the year.

Hogs should be kept so they are able to oil themselves as required. It is little trouble to make a simple oiler at home which will do the trick. Hogs free from lice thrive much better than lousey ones. If you doubt it, try oil-

The Elderkin Fruit Sizer and Grader



To grade your apples quickly, cheaply and in the best possible manner, you require an ELDERKING GRADER, the best on the market, with help so scarce, why not buy a grader at once and get the biggest price going for your fruit.

DAIRYING.

DETECTING BAD ODORS AND BAD FLAVORS IN THE COW'S MILK

A little knowledge of the causes and results of bad odors and flavors in the milk supply may save a lot of valuable time and also prevent the rejection of the supply at the creamery or shipping station. In tracing the cause of bad odors and flavors in milk it is necessary first to determine whether or not the infection is present when the milk leaves the udder of the cow or develops later. If any particular cow is giving milk which is tainted it is not due to bacteria, but to other causes.

To determine whether or not bacteria are the cause of the trouble, fill a pint bottle with fresh milk, cap it tightly and place it in water reaching well up to the neck. Heat the water to the boiling point and hold it there for about half an hour. Then remove the bottle and cool the contents down to about 90 degrees Fahrenheit. Pour into the bottle one tablespoonful of the tainted milk and mix it thoroughly with the contents. If, after standing twelve hours in a warm place, the milk in the bottle develops an odor or taste similar to that observed in the milk being tested, it is quite likely that the bacteria are present which have caused the trouble.

If bacteria are causing the trouble give the utensils a thorough cleaning to determine the source of the taint producers. Often when they find lodgment in the utensils the trouble will no longer appear after things are thoroughly cleaned. If there is no further occurrence it is no longer necessary to seek the source of the bacteria, as they probably were present in the utensils.

If cleaning and sterilizing the milk utensils does not remove the trouble, the water supply should be tested for bacteria. In making a test of the water fill a pint bottle with clean milk, one for each source of water supply, heat it and cool it as when testing the milk for bacteria. Pour one tablespoonful of water from the well to the numbered bottle. In another bottle the same quantity from the cooling tank and in another the same quantity from the source from which the water used for supplying the colling tank is obtained.

If after standing twelve hours in a warm place the milk in one of the bottles develops an odor or flavor similar to that in the milk being tested, the source of the water used to inoculate it would then be indicated. If the water in the cooling tank alone is infected the bacteria probably have found lodgment in the tank itself. To destroy them drain and thoroughly clean the tank, then wash it out with one part fresh burn lime and four of water. It is not often that a well becomes infected, and when it does not much can be done for it. In some cases the water must be boilied before being fit for dairy use. In some cases ropy or stringy milk is caused by bacteria which are prevalent in shallow ponds or streams in which the cattle wade. These same bacteria frequently find their way to the cooling tank. Should the water supply show no indications of the presence of inoculating baacteria the stables should be given a thorough cleaning and disinfecting.

Clean the walls and ceiling and give the whole interior a coat of whitewash. Disinfect the floors and keep the manure cleaned up about the stable and yards. See that the milk is removed from the stable as soon as possible. Use judgment in feeding strong-flavored feeds like silage which may taint the milk if the latter is left in the barn.

If the tainted milk or the water supply fails to develop the taint in the freshly heated milk in the bottles it is pretty certain that bacteria are not the caus eof the trouble. After taking proper precautions to eliminate all danger of the milk becoming tainted through absorption of the taint from the stable or the milkroom, samples of milk from the individual cows should be saved and tested. If the milk from several of the cows shows the taint it is probable that the feed supply or something which the cows have eaten ni the pasture is causing the trouble. Cabbage, potatoes, turnips, wild onions, ragweeds, brewer's grains an dmusty grain feeds frequently cause bad odors and flavors in the milk. When the trouble seems due to the feed and there is nothing in the ration that should cause the trouble, a change of feed may eliminate it in a few days. Some kinds of feed have a tendency to affect tne milk of certain cows that may be fed with impunity to others.—W. K. M.

RECIPROCITY IN REGISTRATION

A significant piece of constructive work was done by the board of directors in its meeting at Detroit, July 22. We refer to the reciprocity arrangement worked out by President Aitken and ratified by the board and a delegation from the Canadian Association, subject to the final okay by the membership of each corporation at its next regular meeting. The details of this plan were given in the news columns of the World last week. In brief, the plan involves complete recognition of the herd books of each association by the other. In the past the Holstein-Friesian Association of America has required that before a Canadian animal is acceptable for registry in our books, all its ancestors shal be registered in our books likewise. The Canadian breeders have contended for a long time against this arrangement, arguing that as their animals originally came almost without exception from the United States where they were registered in the America nbooks, there could be no question of their purity of breeding, while the trouble and expense of registering all the animals back to the American books was a serious handicap to them in disposing of their cattle on this side. As a measure of self-defense the Canadian fee for import certificates was raised to $25 for males and $10 for females. In previous conferences on this subject one point of difference has been the disparity of the registration and membership fees in the two associations. Mr. Aitken solved this problem by suggesting the provision that all animals should be registered first in the books of the association in whose jurisdiction they originated before being eligible to registry in the books of the other associations. In return for these concessions it is expected that the Canadian breeders will revise their fee for import certificates. The details of the plan are being arranged jointly by Secretaries Houghton and Clemons.

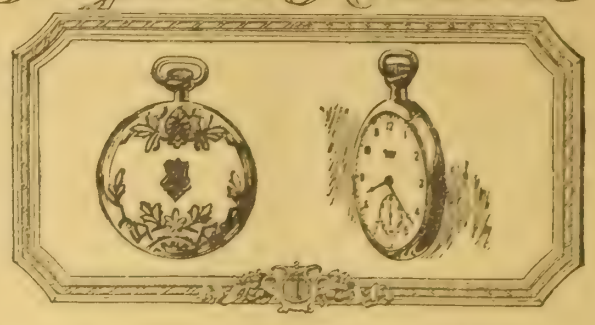
This action by the two greatest breed associations exemplifies the spirit of co-operation and closer bonds of friendship existing amng the allies tday. Recent events have demonstrated unmistakably that we, on this side, need Canada's Holsteins, and we are willing to pay top prices for her top quality. In the Milwaukee sale it will be remembered, tne sensational $106.000 bull calf was a Canadian product combined with a little American breeding. The dam for generations was Canadian bred, while several generations of the sire's side had been developed in Canada, although originating on this side of the line. Likewise, the remarkable 30-pound world's champion two-year-old, the outstanding individual of the sale in the female line, was bred and developed in Canada, although her sire came from northern New York. In short, Canada is breeding Holsteins that are as good as have ever been produced. We need and are willing to pay for her best. The same is true of the Canadian breeders with respect to American stock and a free and unrestricted interchange can mean only greater progress for the breeders of both associations. The World gives its unqualified endorsement to the action of our board and the Canadian delegation, and urges complete ratification of the plan at the annual meeting in Philadelphia next June.—The Holstein-Friesian World.

DEHORN THE DAIRY HEIFER

There are two methods of dehorning dairy animals. One of these which is widely practised is to alllow the horns t ogrow until the animal is fairly mature and then cut them off with special dehorning clippers. This methad removes the horn, gut it is a painful and bloody operation. The other method, is t oprevent the horns from developing.

The calves should be treated when they are from five to 10 days old, or when the horns are just beginning to show as small buttons and before they break through the skin. The hair should be clipped away from this part of the head with a pair of

Ingersoll Reliance



A Master Seven Jewel Watch

AS a watch investment, the Ingersoll Reliance stands alone. It is the best 7 jewel watch you can buy at the price.

As a symbol of personal taste, the Ingersoll Reliance bespeaks refinement. Its slim, graceful case, its beautifully designed dial and its artistry of finish satisfy the most critical taste.

As a time-piece the Ingersoll Reliance is the master product of the world's greatest organization of watch makers. It is a close timer, sturdy of movement and capable of a life-time of reliable service.

The sturdy Bridge Construction, the Safety Barrel enclosing the Spring, and 20 other distinct and recent improvements—most of them found in no similar time-piece—make this the Master 7 Jewel Watch.

In solid Nickel case the Ingersoll Reliance sells for $6. In gold-filled case the Reliance sells for $9. At good dealers everywhere.

ars. As soon as the skin is thus de visible, it should be broken h a sharp instrument, directly over centre of the appearing horn. A p cut should not be made. As soon the skin is broken, a stick of caus- potash should be rubbed on the n until the skin is removed over area slightly less than the size of lime. The caustic can be purchas- in small white sticks, about the e of of a pencil. One end should wrapped with paper or cloth to tect the fingers. Rubbing should tinue over the surface until it be- s to turn white. Too much rub- g may give bad results. As soon this is complete, it is well to ase around the treated area with eline.

t is usually better to use the caus- in a dry form rather than to use wet, because when too much mois- e is present, it may run down into calf's eyes and cause injury.

he caustic should be kept in an tight bottle because in the pres- e of air it becomes wet and sticky is difficult to handle. With a little erience, one can perform this op- tion in about five minutes and the ns will never develop, says W. W. ett, of the University of Missouri lege of Agriculture. In case it is properly done, short spurs will elop. These may be clipped off r a year or two, with very little ry to the animal.

WBARN COMFORT AIDS DAIRY PROFIT

his is proving the worst time of year to keep cows.

owever, it does not pay to neglect cows and let them drop off in milk flesh. If they are neglected it take more roughage and grain to them back to where they should e been, and chances are they will er do as well.

hear someone say: "Feed is too priced; we cannot afford to buy True, feeeds are high priced, but y products are going up too, and be higher on account of the large and. One-sixth of the human consumed is dairy products. If cows are fed and kept in good lition, even though you make only mall profit and sometimes break n, you will be repaid as the cows be in good shape to go to pasture spring and make a much bigger it than if no grain had been fed he winter.

oo many dairymen and farmers, le they know that their pasture is t, still expect their cows to keep e, say nothing about giving milk. n they wonder what is the matter their cows, as they all drop off milk, even those that have been h only a few months.

great mistake that is made and quite general, too, is leaving the s out at night in all kinds of wea- As long as there is a barn for n, why not put them in it and have n feel comfortable? One often s the expression used, "My cows be out until the snow flies; too h bother to put them in." It does no take any loner, and in most cases not as long, to clean out the barn as it does to g oout early in the morning to hunt up the cows and bring them in for milking.

Cows should be stalled over night from the time it turns cool in the fall. Some dairymen don't see it that way, but it is true. When the cows are exposed to cold weather they use the feed the yget to keep warm instead of giving milk. If they are turned out to a straw pile in the cold, how are they going to give milk?

MILK FROM DISEASED UDDER DETERMENTAL TO HEALTH

Milk from the udders of cows suffering from mastitis (commonly called caked bag, garget, etc.) should not be used for human food as some very troublesome disease may arise from doing so, especially in children. Milk from udders or portions of udders so affected nearly always contain harmful bacteria which multiply with great rapidity when the milk is drawn and these organisms may be responsible for anusea, vomiting and even diarrhoea in the consumer. Epidemics of septic sore throat in many instances have been traced to the milk supply having been contaminated by one or more cows in a herd which were suffering from mastitis. The pus present in milk from a mastitis udder may impart to the milk an unpleasant taste and the milk may curdle and putrify within a few hours after being drawn. If only one quarter of an udder is affected and a small top milking pail is used the milk from the healthy portions may be used. The diseased portion should then be milked into a separate vessel and boiled before being disposed of.—Wm. H. Feldman, Colorado Agricultural College, Fort Collins, Colo.

IT WOULDN'T BE DONE IN CANADA

(Hoard's Dairyman.)

At a meeting of dairy farmers, to consider the price to pe asked for milk, one of the farmers made a very pertinent statement. He said: "How do you farmers who are eating oleomargerine and producing milk square yourself with your conscience? Many of you have made the statement that dairy products are too cheap and when asked why you eat oleomargarine instead of butter, declare it is too expensive. If butter is too expensive for us, who produce it, to consume, how can we expect the wage earner to eat it? Aren't we setting a pretty poor example for the city consumers when we farmers eat oleomargarine instead of butter?

TYPHOID FREQUENTLY SPREAD BY MILK

Milb-born epedemics of typhoid fever are the result of carelessness on the part of both the milk dealers and producers, and the city and county authorities.

"The city phpsician and county physician should exercise very close supervision over the milk supply and practicing physicians should immediately report cases of tpyhoid in the dairies to the end that immediate steps may be taken to protect the public," says Dr. Geo. H. Glover of the Colorado Agricultural College.

"When a case is discovered, either the patient must be isolated, or removed entirely from the dairy. The only alternative is to immediately suppress the milk supply from this dairy. It is not presumed that the dairy inspector, where there is one, is posted on health conditions of the family and he must rely on the family physician for this information.

"Milk should not be sold from a dairy where there is typhoid fever and the family physician is the one most responsible. This of course applies to the family that keeps one cow and sells the milk to the neighbors, as wel las to the regular dairies that do business on a larger scale.

"In Denver, a few years since, a milk vender was also nursing his wife, ill with typhoid fever, and fifty-seven typhoid cases developed on his milk route. Cases like this are not exceptional and the selling of milk from dairies and homes where there is typhoid should be one of the first subjects of inquiry."

THE SHEEP TICK—WHAT IT IS?

The Injury it Does, and How to Prevent it.

The major portion of the sheep flocks of Maritime Canada are now in winter quarters. Fresh from the fields in which they were furnished with abundance of succulent food to flush them for the breeding season, the closer confines of winter quarters find them in good condition to cope with the rigors of the approaching winter.

Have you examined the flock to see if it is free from ticks? Have you taken the necessary precautions to prevent ticks from gaining a foothold in the flock this winter?

The following treatise on "The Sheep Tick" by the manufacturers of one of the standard reliable sheep dips will be interesting to sheep owners, and if its contents will help our readers to protect their flocks from the ravages of vermin, the mission of this article will have been fulfilled.

(Ked or Louse Fly)

Though the commonest of all Sheep Pests, accurate knowledge about the Sheep Tick is rarely met with. In view of the interest the subject has recently aroused, especially in Tasmania, it will be opportune to lay before sheep owners some reliable facts about the Sheep Tick.

It may be well to explain at the outset that, though commonly known as the Sheep Tick, this parasite is in no way related to the True Sheep Tick, but is in reality a wingless fly, which a glance at its form would suggest. It is, indeed, in some parts of England, called the "Louse-Fly," because, like Lice, it deposits its eggs amongst the fibres of the fleece. In Scotland and elsewhere it is commonly called the "Ked." The true Tick, when adult, has 8 legs; the subject of this booklet is a 6-legged parasite.

The scientific name of the so-called Sheep Tick or Ked is "Melophagus Ovinus." As, however, it is known most commonly throughout the Sheepman's World as the "Sheep Tick," it is so termed in this treatise.

Distribution

The Sheep Tick is the most widely distributed of all Sheep pests, few flocks being entirely free from it. It thrives best on British breeds of sheep and their crosses. It is a restless insect, prone to constant movement in the fleece. Thus the dense fleece of the merino proves a less attractive haunt for it, and, in consequence, this breed does not suffer so much from its attacks.

The Sheep Tick is found in greatest numbers on those parts of the body which the sheep cannot reach or rub.

It is the common experience of Sheep owners that the virulence of this pest varies according to the conditions of season, affecting, as they do, the welfare and general health of the sheep. When the weather conditions are unfavourable, and the sheep are in consequence in poor condition, they become more subject to attack by parasites. On the other hand, when the sheep have been reduced to poor condition by the ravages of the Ticks, they are rendered less able to withstand an unpropitious season.

Some Flockmasters believe that when the sheep are feeding on root crops Ticks are more prevalent; but this possibly is explained by the fact that when on roots the fleece is long, and the Ticks, though hidden by the wool, have been increasing since shearing.

Indications and Results of Tick Attack

The presence of the Tick usually is indicated by the sheep nibbling at their sides, or rubbing against objects for the purpose of obtaining relief from the irritation which the Tick bites set us. Like many other parasites which pierce the skin, the Sheep Ticks inject a fluid into the wound with the object of preventing the blood from coagulating and thus rendering it more readily imbibed. The result is intense irritation or itching. Thus it will be realised that when the Ticks are numerous the sheep are in a constant state of torture and unrest, which causes them to go off their feed and lose condition, to the serious financial loss of the owner through their reduced market value, both in flesh and wool.

Life History of the Sheep Tick. (The Ked.)

This parasite spends the whole of its life on the sheep, except when some happening compels it, or enables it, to transfer itself to another member of the flock. In that respect it differs from the true Tick which, when gorged, falls off the sheep on to the pasture, living apart from a host for a considerable period, during which its eggs are deposited and young hatched out.

The female Sheep Tick lays only three to five eggs, at intervals of a few days, attaching them to the fleece by a sticky substance which she exudes, thus effectually preventing them becoming detached from the wool. These so-called eggs, which are the colour of apple pips, are not true eggs, but what are termed "puparia,j" in other words pupa cases. When they are deposited by the Female Tick they already contain living pupae or larvae, which previously have been generated in the parent's body.

Some 21 days after the eggs have been deposited in the wool, the end of the larva case breaks off, and the young insect emerges, and commences its active life in the fleece.

The aobve facts are of special interest in connection with the efficacy of dipping, and should be carefully noted and remembered by sheepowners, since the dippings must be so timed as to kill both the adult Ticks present at the time of dipping, and the young Ticks which may hatch out from the Tick-eggs; for these eggs, though present in the fleece at the time of dipping, are not devitalised by the effect of the Dip. If, however, the Dip is not of a volatile nature and is sufficiently lasting, it remains in the fleece strong enough to destroy the young Ticks as they hatch, especially as they are then very tender, and easily killed by a lasting Dip.

How Long Do Ticks Live?

It has already been mentioned that Sheep Ticks pass their whole life on the sheep. If they become accidentally detached from the sheep, and are thus deprived of their natural food—the blood of the sheep—they rarely survive longer than four days. Under exceptional circumstances they may live a week. In one recorded instance the issue from the pupa cases survived for nearly two weeks, but this must be regarded as a very exceptional case.

On the other hand, observation shows that Sheep Ticks pass readily from sheep to sheep. After the shearing, which deprives them of shelter, thy transfer themselves in great numbers to the longer fleeces of lambs, persecuting them relentlessly.

The Prevalence of Sheep Ticks Varies With the Seasons.

Climatic conditions, the condition of the sheep, and the character of the country, all have some influence upon the prevalence of Sheep Ticks. In wet seasons, and in wooded country, they are most in evidence. It has been seen already that poor condition of the sheep and Tick infestation go together; but it is not clear whether the Ticks cause the poor condition, or whether the poor condition is the reason of the more severe Tick infestation. The dictum—"Poverty brings Ticks"—may perhaps more truly be read—"Ticks bring Poverty."

The habits of the Ticks are greatly influenced by changes in temperature. In cold weather the Ticks are found close to the skin, either feeding or resting a little distance from the roots of the wool. In hot weather, especially in spring, they may be seen in active movement near the tips of the fleece, apparently enjoying the sunshine.

When feeding they bury their sucking tubes in the skin, and breathe through stigmata or pores which they possess on each side of the body.

Dipping for Ticks

In dipping Sheep for Ticks, although it is an important consideration to secure immediate destruction of those parasites which are alive in the fleece at the time of dipping, it is even more important to achieve the destruction of the young Ticks which subsequently issue from the pupa cases or "eggs."

These pupa cases are hard and glossy, and it is doubtful whether any known dipping preparation will penetrate them, at least with sufficient certainty to destroy the embryo within.

Thus, unless all the trouble and expense of a second dipping is to be incurred, it becomes necessary to use a Dip which not only kills the Ticks in the fleece at the time of dipping, but also maintains its killing properties in the fleece for a considerable period after the day of dipping.

The Dip which complies with this condition, and at the same time has no detrimental effect upon either sheep or wool, unquestionably is and must always be, the bets Dip to use.

The importance of using a Dip possessing undoubted lasting properties cannot be too strongly emphasised. A Dip which kills only the live Ticks, and does not last long enough in the fleece to kill also the young Ticks which hatch out after dipping, cannot possibly yield effective results.

Non-Poisonous Fluid Dips

Non-poisonous preparations, whatever may be claimed for them by those interested in their sale, do not possess these lasting properties, and in consequence they are useless for keeping the flock free from Ticks. However they are useful in other ways, as we shell see later.

Solubility of Dips

A reliable criterion of the lasting properties of a Sheep Dip is its degree of solubility.

Whn a dip instantly and completely dissolves in the ath water, it is obviously exposed to like effects from the rain which may fall on the sheep after the dipping, and which will then wash the dip completely out of the fleece. This is plain common sense that only needs to be stated to be believed.

ndr os,pn ataO bsr r,o 6fioe ydalk

It follows, therefore, that a dip of this class can have no sufficient protective property; for its killing power will disappear in a few days, perhaps in a few hours, and there will be nothing remaining in the fleece to kill the young Ticks as they hatch out.

It takes about three weeks for the pupae of the Sheep Tick to mature and emerge from their cases. Hence it is clear that any dip that becomes inactive before this period has expired cannot have the slightest efficacy in permanently ridding the sheep of its Ticks. It may kill the Ticks which are alive and active at the time of dipping, but it cannot destroy the issue from the pupa case. In other words, it must fail in its purpose. This was proved to demonstration by prolonged comparative tests of poisonous and non-poisonous Dips by experts appointed by the Hawkes Bay Pastoral Association in New Zealand some years ago. They proved that all the Sheep dipped in non-poisonous Fluid Dips quickly again became infected with Ticks, whilst those dipped in poisonous Dips and run on the same pasture remained perfectly clean. All the conditions were exactly alike except that different Dips were used.

The Dip that Lasts

As bearing on this point, viz: necessity for "lasting powers" is a Sheep Dip, it may be pointed out that the manufacturers state that one of the chief objects in the mind of the inventor of our most popular Sheep Dipping Powder was to secure this absolutely essential continuity of action.

That he successfully solved the problem by his special method of manufacture is probably one of the chief reasons why that preparation has always held, and still retains, such

WHERE SHALL I SHIP MY FURS?

The Important Problem

Every Fur Shipper Must Solve to be Successful

You are receiving price lists and other literature from many different Fur Houses—all claiming to pay the highest prices, etc., etc. This makes it difficult for you to choose your Fur House and a wrong guess may mean dollars out of your pocket. You must exercise great care and caution in choosing the Fur House to whom you are going to entrust your catch of Fur-bearers. You can solve this important problem by making "Shubert" a trial shipment.

For more than thirty-five years "Shubert" has been paying Furshippers "more money for their Furs—always giving an honest and liberal assortment—paying the highest market prices—sending returns out promptly, in other words, rendering "better service"—"quicker." "Shubert" offers you the SERVICE of an honest—reliable—responsible—safe Fur House—where you take no risk. "The Shubert Guarantee" protects you absolutely. A trial will convince you. Get a shipment off—TODAY.

are market toppers from baby beef stage to maturity, grow quickly, fatten rapidly, have high dressing percentage and abundant milking qualities.

DOMINION SHORTHORN BREEDERS' ASSOCIATION
W. A. DRYDEN, Pres., Brooklin, Ont. G. E. DAY, Sec., Box 285, Guelph, Ont.

markable favour amongst sheepowners in every part of the world.

It is so prepared that only part of its bulk dissolves immediately in the bath —sufficient, of course, to kill all insects alive in the fleece at the dipping.

The remaining part does not at once dissolve, but being in the form of innumerable very minute particles, which are kept in suspension in the bath water by thorough stirring, is distributed throughout, and retained by, the fleece, thus for many months acting as a preventive of re-infection.

Once these protective particles are dry and fixed in the fleece, ordinary rain cannot wash them away; on the contrary, each time they are wetted they are stimulated into renewed activity, with the result that it may be said that each shower of rain acts almost as a supplementary dipping.

It will be seen, therefore, that a dip having such lasting active properties is just the one to deal successfully with the Ticks, because it renders the fleece uninhabitable by those young parasites which emerge from the pupa cases subsequent to the dipping.

In other words, the new generation of Ticks which hatch out after dipping find their surroundings intolerable and soon die, particularly as, when they first emerge from the pupoe, they are naturally in a very weak condition.

Thoroughness in Dipping

In order to secure the full measure of protection from any sheep dip, it is essential that the user should contribute to the result by using the dip properly. He must mix the dip strictly according to the maker's direction, stir sufficiently during the dipping, and otherwise observe the instructions given by the makers for his guidance. An important essential is that the sheep should be kept moving in the bath sufficiently long for the wash to reach the insect pests, many of which will be on the skin with their heads buried in their hosts. Also there must be sufficient growth of wool at dipping to carry away enough Dip for the all-important protective purposes.

What is worth doing is worth doing well. A little trouble taken with the dipping will save much trouble afterwards.

The immense benefits that result from dipping sheep properly are even now hardly sufficiently understood by practical Sheepmen. They fail to realize the importance of thorough immersion to saturation, and the big difference in results between stirring the bath and thus ensuring that its valuable protective particles are distributed throughout the fleece of every sheep, and allowing these particles (for which they have paid good money, and which constitute one of the most important ingredients in the Dip) to sink to the bottom of the bath as useless sediment.

If there be failure, it is certainly due to lack of proper methods and not to the Dip.

When to Dip Sheep

Unfortunately, the practice of dipping sheep direct from the shearing board, is too prevalent in the Australian States, since it cannot be consistent with obtaining the best results from dipping.

When insect pests are little or not at all in evidence, and wool-improvement is the object aimed at, off-shear dipping may achieve the desired object. But in districts where sheep parasites abound, the dipping of sheep off the shears—British breeds especially —is unwise and unprofitable.

Dip makers recommend that dipping should be carried out with four to six weeks' growth of the merino fleece, and two to three months' growth on the British breeds, for reasons which are apparent from the foregoing, viz.: that the sheep may have sufficient fleece to carry away the protective particles of the dip.

The usual difficulty, of coures, is remustering; but sheepowners who realize how much their shearing returns depend upon efficient dipping choose the lesser of two evils, viz.:—to remuster and dip, because this course will, in improved condition of sheep and wool, more than compensate for the trouble it occasions.

The Bath Water

Another obstacle to satisfactory dipping results is the use of hard water, which only slowly penetrates a greasy fleece. If the water cannot get to the seat of the trouble, how can the dip it carries do so? Hard water is characteristic of limestone districts, and its hardness is generally known or easily recognised by its behaviour with soap. It may be softened by adding 2 lbs. of common washing soda to each 100 gallons of wash. Dissolve the soda first in hot water and then stir into the bath.

Whatever the length of fleece, successful results depend upon the penetrability of the wash, combined with immersion to saturation.

It is now becoming customary to add a non-poisonous fluid dip to the powder wash when the water is hard, to increase the penetration of the bath liquid; about 1 gallon of fluid dip to 500 gallons of powder wash will serve to counteract the effects of hardness in the water, and repays the small additional cost, owing to the increased efficiency of the dipping.

Short Baths

These are a common cause of unsatisfactory results, as they encourage shortening of the period of immersion. All Leading Dipp Makers recommend at least one minute's immersion; and for cross-breds this is not too long, especially when the object is to destroy young sheep ticks hatching after the dippings. In short baths the sheep rarely get more than a quarter of this period. When the bath is less than 60 ft. in length, it is essential that the sheep, particularly young sheep, should be prevented from rushing through and thereby losing the benefit of sufficient immersion. It is in short baths particularly that the fluid dip may be added with advantage to the powder wash (as above recommended unde rthe heading "The Bath Water,") to accelerate the pentration of the mixture.

Safety in Sheep Dips

Dipping newly shorn sheep, with open or undressed shear cuts with any preparation worth using as a sheep Dip, may result in loss if the wounds be bad and the blood of the sheep be not in good condition. For these and for other reasons, whatever the Dip used, it is then said to be "hard on the sheep." It is not that the Dip was hard on the sheep, but that the sheep were in an unfit condition for dipping. The chances are ten thousand to one that the condition of individual sheep is more likely to vary than the uniformity of a Dip of established repute. The surest proof of the safety of a Dip is the extent of its use, and its reputation amongst owners of valuable flocks. Considering the way that some sheep get gashed in shearing, and the frequent neglect to dress the wounds, it is a wonder that so few casualties occur, and they certainly cannot fairly be attributed to the dipping.

From Dipping to Shearing

Quite a number of sheepowners think that a dip should keep sheep absolutely clean from dipping to shearing. This old belief or tradition comes down from the times when pastoralists ran merinos only. With the enerality of merino flocks the belief is justified; but where British breeds prevail, it is not. These British breeds, as we have seen above, are more subject to parasitic infestation by reason of their loose fleces being particularly suited to the habits of parasites.

The makers of one of our most reliable Dips which is admitted to be the most lasting of all Dips, have definitely stated that "human ingenuity has yet to devise a preparation that can with one dipping, under all circumstances and all dangers of re-infection, keep crossbred sheep absolutely clean from dipping to shearing."

Nevertheless, when a good Dip is used with faithful observance of the directions, and there is enough fleece at the dipping to carry away sufficient of the protective particles, it practically accomplishes the feat under normal conditions.

It is a common remark amongst those who use this preparation according to directions—"Why! you can smell it at the shearing." This fact is evidence of the lasting effects of the dip, and it is not surprising that fleeces so impregnated with the dip that they "smell" to the human nose, are intolerable to Sheep Ticks which are furnished with very highly developed sense organs of smell and taste.

"Only a Few Ticks

here is a wide difference between sheep having ticks, and ticks having the sheep. When properly dipped in

(Continued on page 155)

The Basis of Profitable Dairying

The influence of feed on the production of milk is striking. No matter how good the individual dairy cow is, the quantity of milk she yields is, within wide limits, directly dependent upon the feed she receives.

If a cow is subjected to feed of poor quality, unpalatable and indigestible, no matter how much she may be fed, she is sure to go away down in her production and will not yield any profits. Such a cow becomes a "boarder"—that is why our experts have compounded a mixed feed, properly balanced according to the needs of the dairy cow, rich in milk-producing nutrients, with a high percentage of these nutrients in digestible form.

Monarch Dairy Feed

a rich feed, but not too concentrated to feed alone and when fed liberally to dairy cows it will get the highest production possible with the least cost. There is no wastage in Monarch Dairy Feed—every pound has milk-producing value in it and more of it goes to the actual production of milk than of other feeds because such a high percentage of it is digestible.

Monarch Dairy Feed is composed of Oil Cake Meal, Cotton-seed Meal along with Bran, Barley feed and Corn feed. The mixture of Oil Cake and Cotton-seed Meals counteracts the constipation that would be caused by Cotton-seed Meal if fed alone.

Give Monarch Dairy Feed a trial and if the dealer in your district does not handle it, send us his name and we will see that you get it. By ordering early you will assure delivery when needed.

THE HORSE

VOLVULUS OR TWISTED BOWEL

Volvulus or twisted bowel consists of a rolling on itself of a portion of intestine (either large or small) until nothing can pass through. A knot practically exists. The symptoms and results are indentical with intussusception. The existence of either condition can be suspected only, and treatment should be directed to relieve pain by administering 1 or 2 ozs. of chloral hydrate either in bolus or solution every two or three hours. If gases form give 2 to 3 ozs. oil of turpentine in a pint of raw linseeed oil. Keep comfortable; apply to the abdomen cloths wrung out of hot water, and give rectal injections of warm, soapy water. If the pain becomes relieved give a laxative of 5 to 8 drs. of aloes and 2 drs. ginger, and follow up with 1 to 3 drs. of nux vomica three times daily. Of course, if either of the above-mentioned conditions exist, treatment will be of no avail, and death will take place unless a spontaneous righting of the involved bowel takes place; but if it be a case of constipation without displacement of intestine a recovery will probabyl take place.

Intestinal Concretions of different kinds occasionally form in the stomach or intestines, probably more frequently in the large intestine than in other parts. Some are composed of phosphates — called phosphatic calculi; these are hard, smooth and polished, having a nucleus, generally o piece of iron or stone, others are composed of beards of grain, hair or other indigestible matter, often mixed with phosphatic salts.

Symptoms.—No reliable diagnostic symptoms are present. Their presence can be suspected only by repeated attacks of colic without any appreciable cause. As a calculus is usually moveable it is probable that it gets into a position that obstructs the passage, hence causes colicky pains. The violent actions of the patient., doubtless, in many cases change the position of the obstruction, open the passage and relieve the symptoms. At last a time comes when, by reason of inflammatory action and swelling, the concretion retains its position and causes death, preceded by symptoms resembling those of the conditions just discussed. In some cases the calculus is situated in the rectum and can be reached by the hand and removed. This teaches the advisability of exploring the rectum in all such cases of a doubtful nature.

Treatment.—The treatment indicated is that for colic, viz., the administration of anodynes, as 1 to 2 ozs. chloral hydrate, or 1 to 2 drs. of the solid extract of belladonna or 1 to 2 ozs. each od laudanum, tincture of belladonna, and sweet spirits of nitre, in a pint of cold water as a drench. This dose may be repeated every two or three hours as indicated, but when more than one dose is required it is wise to omit the laudanum, as it tends to constipote. If a calculus be present treatment will be of no avail, but as we cannot be certain of its presence we are justified in treating for colic. Horses that are subject to repeated attacks of this nature, whether the cause be calculi or a weakness of the digestive organs, are very undesirable. When the cause is purely digestive weakness the attacks can often be prevented by regularly giving the animal a good stomachic, as a dessert spoonful of ginger and a teaspoonful of gentiaan in an evening feed of damp grain. This usually tones the digestive glands, thereby aiding digestion and preventing the attacks.—J. Hugo Reed, V. S.

ENTERITIS

Enteritis, or inflammation of the bowels, is one of the most rapidly fatal niflammatory diseases to which the horse is liable, often causing death in a few hours. Many of the diseases of the digestive organs, some of which have already beene discussed, result in enteritis, but we will now discuss it as a primary affection. Any portion of either the large or small intestine is liable to be the seat of the trouble, and in some cases the greater part of each is involved. The inner or mucous coat is usually first attacked, but the inflammation extends and involves the middle or muscular coat, and also the outer coat, an dthere is often an extravasation of blood into the canal due to rupture of the small blood vessels.

Causes.—The principal causes are fatigue, exposure to cold, standing in a cold draft, or drinking large quantities of cold water when overheated, but, like othe rintestinal diseases, it frequently occurs without well-marked cause.

Symptoms.—The first well-marked symptoms are usually those of abdominal pain, evidenced by uneasiness, stamping of the feet, whisking of the tail, looking around toward the flank, a desire to lie down, etc. These symptoms are, however, usually preceded by some degree of constitutional disturbance (which may pass unnoticed) as shivering, acceleration of the pulse and respirations, repeated evacuation of small quantities of semi-liquid fæces, and general depression. The mucous membranes soon become deeply congested, the mouth dry and hot, the tongue contracted, and sometimes of a brownish color; the appetite is, of course, lost; the pulse is hard, strong, wiry, and frequent; the abdomen is tender upon pressure; the abdominal muscles are more or less contracted. In some cases slight bloating is noticed. In a variable time the symptoms of dulness and depression give way to those of pain and excitement; the horse stamps with his feet, strikes at his abdomen, lies down—but usually does so very carefully, often making several attempts or feints, and then goes down with great care, and will probably endeavor to lie on his back—looks towards his flank, pants, blows, and perspires freely. There are no sharp paroxysms of pain with period of ease as in many cases of colic. The pain is constant, distressing and agonizing in intensity, but to some extent varies in intensity. The body is usually covered with perspiration. In some cases he will stand for hours with his head in a corner and paw persistently with one or both feet. In other cases he will walk around in the stall or paddock in a circle, apparently almost blind, knocking his head against the wall or fence. The pulse is at first hard, full and frequent, varying from 80 to 120 per minute, but generally decreases in strength and fulness and becomes thready and almost or quite imperceptible at the jaw. He sighs or groans from pain, and perspiration drops from the body. The skin is seldom dry, at one time hot and another cold; the countenance becomes haggard, the eyes expressive of delirium with the pupils dilated. He may throw himself about in a dangerous manner, but usually stands or moves aimlessly about, then stands and balances himself as long as possible, when he will fall and expire with a few convulsive struggles.

In other cases the symptoms of pain subside and he will stand quietly, even drink a little water or endeavor to eat, and his breathing becomes more or less tranquil. This often leads the owner to think that recovery is taking place, but the symptoms indicate that mortification is commencing; the haggard expression remains, the pulse continues imperceptible at the jaw, cold sweat bedews the body, the abdomen usually becomes bloated, he trembles, ears and legs become cold, mouth and breath cold and often foul smelling; the lips drop pendulous, the eyes become glassy, and in a variable period he drops and dies. The bowels usually remain inactive to the last. If, however, in thre or four hours from th ecommencement of the attack there is some abatement of the symptoms; if the surface of the body becomes dry, if there be passage of fæces or gas, the pulse becoming softer and less frequent, and the characteristic anxiety of expression disappears, a favorable termination may be looked for.

Treatment.—As the mucous tract of the bowels is the primary seat of truoble, treatment must be directed with a view to checking the action of the bowels until inflammatory action has ceased, and although there is usually an inactive condition of the bowels purgative or laxatives must, on no account be given. Treatment must tend to relieve pain and check the movement of the intestines. For these purposes opium must be administered in large doses. In the early stages, when the pulse is full and strong, if depressions be not well marked it is good practice to give 12 to 15 drops of Fleminy's tincture of aconite in a little cold water, or extract 3 to 4 quarts of blood from the jugular vein. From 2 to 3 drs. of powdered opium should be given in a pint of cold water as a drench, and rather small doses every tw ohours until the symptoms are relieved. Cloths wrung out of hot water should be applied to the abdomen continuously for a few hours, and care be taken to clothe the patient well afterwards to prevent too great reaction. If, after abatement of the symptoms, the bowels remain torpid (as they generally do) the removal of this torpidity must not be attempted by the administration of drastic purgatives. Very small doses of raw linseed oil, say 4 to 6 ozs. with 2 drs. nux vomica, may be given about every eight hours, and the contents of the rectum removed by injections of warm soapy water occasionally. When the appetinte returns the most easily digested foods, as bran and boiled linseed, should be given, and the eating of dry food prevented until the bowels commence to act; and then solid foods should be given in only very small quantities for a few days. —J. Hugo Reed, V. S.

DIARRHOEA

Diarrhoea is the term applied to all cases of simple purging if the fæces are loose, liquid or semi-liquid, and frequently voided, without co-existing inflammation. Diarrhoea is sometimes a spontaneous effort to discharge from the intestines something which is irritant or obnoxious to them or to the system generally. It is also induced by a variety of causes, such as indigestible food, food imperfectly masticated, sudden changes in diet, particularly from a dry to a moist one, medicinal agents, parasites in stomach or intestines, derangement of the liver, drinking large quantities of water when overheated, etc. Probably the most freuqent cause is the conshmption of stagnant or impure water.

Some horses are particularly predisposed to attacks of diarrhoea from trivial causes. Short-ribbed, flat-sided, narrow-loined horses, and those of very nervous temperament are apt to purge without apparent cause. They are commonly called "washy" horses. They will start upon a journey in apparently the best of health, but after being driven a variable distance will commence to purge more or less freely, passing liquid or semi-liquid fæces (often acocmpanied by flatus) in small quantities and frequently. In some cases feeding exclusively on dry food will prevent the trouble, but in others it will not. Such horses are hard to keep in condition, require the best of food and very careful feeding, and are unpleasant to drive. If used for slow work they usually give fair satisfaction. Some horses become "washy" as the result of swallowing imperfectly masticated feed, due to faulty teeth. Such can be successfully treated by having their teeth attended to. Others may be "washy" only when fed some particular food or watered under certain conditions, and of course these after the cause has been ascertained, can be successfully treated by removing or avoiding the cause.

Acute Diarrhoea is that condition in which an animal not "washy" from predisposition or acquired conditions, purges freely without suffering acute pain. The fæces are voided freeely in liquid or semi-liquid form, often a dirty brown color, and usually without offensive odor. In other cases the excretions are foul smelling and often a dirty clay color. In some cases a spontaneous cure results in a few hours, indicating that the trouble was caused by some irritant in the intestine, which was expelled with the excreta, and a rapid recovery took place. In other cases the trouble continues, the animal loses appetite, but thirst is usually excessive, he drinks large quantities of water, regardless of its quality, he fails rapidly in strength, and, if the trouble be not checked he will become unable to stand, and death will soon take place.

Treatment.—If possible, ascertain and remove the cause. If this can be done in the early stages it is often all that is required. If it be suspected that the disease is due to some irritant in the intestines, and the patient is not showing weakness and loss of appetite, a laxative of 1 to 1½ pts. of raw linseed oil should be given. This, of course, temporarily increases purgation, and is given with the hope that this increase will cause the removal from the intestine of the irritant that is responsible for teh trouble. In fact it is a good practice in all cases of acute diarrhoea in which the patient still retains a reasonable appetite and reasonable strength to give a laxative.

After giving the laxative nothing should be given to check the diarrhoea for at least twenty-four hours, as it requires that length of time for the laxative to establish and complete its action. If astringents be given earlier they will counteract the laxation, and there will be practically a negative result from each, hence no good will result. If after this length of time the diarrhoea still continues, means should be taken to check it. Also, if the patient has lost appetite and is becoming dull and weak, even in the early stages, he is not in condition to withstand the still further weakening effects of a laxative, and prompt means of checking the diarrhoea should be taken, even though we suspect the presence of some movable irritant in the intestines.

While, upon general pricniples, we say that "diarrhoea should not be too quickly checked," experience teaches us that in case of acute diarrhoea, presenting the symptoms noted, prompt meaure are necesary to check it. For a horse of ordinary size we once, but the patient's thirst should be satisfied by allowing small quantities—say a gallon at a time, and given every half hour or even oftener if necessary. To the water add one-quarter of its bulk of lime-water, that is, four parts water and one part lime water. This, in most cases, gives good results.

We are often impressed with the idea that the lime-water gives more marked results than the drugs. Lime-water is made by slacking a lump of lime, then adding considerable water, stirring well, then allowing to settle. The undissolved lime prepcipitates and the clear liquid on the top is lime-water. It cannot be made too strong, as the water will dissolve and hold in solution only a certain quantity of lime and the remained precipitates. In other words lime-water is a saturated solution of lime in water, that is, the water contains all the lime that it will hold in solution.—J. Hugo Reed.

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Gombault's Caustic Balsam will give you immediate *Relief.* A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy
Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that." —Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

HERCULES
Leather-Chain Trace

A harness is as strong as the trace—no stronger. The trace takes the strain and the strongest trace is the best. The Hercules is a flat shaped trace, strong as steel, flexible as leather, tough and unbreakable, made of steel chain covered with heavy leather neatly finished in turned and rounded edges strongly stitched. Powerful heel chain and either clip or bolt piece at hame end; one and one-half inch solid leather billot. Does not chafe the horses and is tremendously satisfactory. If you don't have the Hercules Trace on your heavy harness, don't wait order a set NOW. If your dealer does not have it, order from us direct. We will ship same day, on receipt of price.

POULTRY.

FEEDING POULTRY FOR EGGS—WHEN GIVEN PROPER RATIONS WILL DOUBLE PRODUCTION

It is possible to double the egg yield of a flock of hens and actually save feeed at the same time if the hens are properly cared for and fed the same ordinary grains used now but furnished in correct proportions, amounts and proper methods. In the following article Mr. T. E. Quisenberry, president of a large school of Poultry Husbandry tells how to increase egg production through more practical methods of feeding. Read what he has to say:

Hens that are not properly housed and handled, and which are not comfortable and happy, cannot be expected to produce their maximum number of eggs. Breeding, however, determines the posibilities of any hen. What causes five White Plymouth Rocks from one breeder, kept in one house, to lay 500 eggs in one year, when another pen of five White Plymouth Rocks from another breeder kept and fed and caerd for in the same house to produce 1,000 eggs in twelve months? It is not the feed, the house, the water, the climate, or any other one thing which can be thought of, except the breeding, the blood lines and the power or ability of one to produce more than the other. For generations one may have been bred for eggs and the other evidently had not been so carefully selected and mated.

When placed under the microscope, it will be seen that every hen has from 2,000 to 6,000 ovules or small yolks in her body. This is more than any hen was ever known to produce in a life time. The number of possible yolks and the number of eggs produced seems to bear no relation to each other. The problem seems to be to select and breed your birds that they have the ability to develop these tiny yolks. You may give a hen all the feed she can eat, if she is lacking in this ability, she will become overly fat or break down, but will not lay eggs. Breeding makes it possible for a hen, when rightly fed and rightly cared for, to produce a profitable number of eggs.

Right feeding alone is not the key to increased egg production. More depends on careful selection of the hens. Too many farm flocks are nonproducers and drones. Perhaps this is true of the entire flock or maybe only a part, but the drones are always responsible for the limited profits.

By selection, I do not mean that the farmer should buy prize chickens at exorbitant prices, though I do believe in good blood. But selection is just as necessary in a flock of poultry as in a dairy herd.

Now ,when you ask if the farmer can afford to keep chickens while the war is going on and grain is so high, if you refer to the usual flock of culls, I wi'l say, "No." Grain is too valuable to be thrown promiscuously to nonproducing hens.

It may be that you wil think when I mention selection that refer to a lot of scientific and complicated experiments. I simply mean that you should go into your flock, pick out the culls and get rid of them. A hen of low vitality is a menace to the flock because she is susceptible to disease. She is an expense to her owner because she is a consumer and not a producer. It is a funny thing, but many farmers who would be quick to get rid of a poor cow will keep two or three dozen hens that never have made a cent for him or never will, no matter how he cares for them.

How to Make Selection

The rules that govern selection are as simple as A, B, C to any observing person. For instance, a hen that is slow to feather is lacking in vitality. Anyone ought to know that. You can't stuff her and make her lay eggs. She is by nature a weakling. Hens do not lay eggs because they want to; they lay eggs because they are strong and vigorous and egg laying is a natural result which they cannot avoid. That tendency must be bred in them.

Why, if the average farmer would give half the attention to his poultry that he does to his live stock he'd find the poultry the best investment in many cases. Success comes from being willing to discard. When you have culled out the poor hens and get them clear off the farm, then it is time to begin thinking about feeding for egg production and also, let me emphasize, watering for egg production, for water is as esesntial as feed.

At this time one of the greatest problems facing poultry men is the ratio of profit between the cost of feed and selling price of poultry and eggs. ..o poultryman can object to the high price of feed if the selling price of poultry and eggs is proportionately high. Thousands of the more or less inexperienced poultry men, who were loaded with poor stock, drones and slackers, or who, because of inexperience, haphazard methods, or poor management, have been forced out of business. Many others in the same class are certain to go, but the future promises much for the man who has the goods and who knows how.

Get Rid of the Drones

Before carrying your birds through another season, take one more look at them, and keep the following rules in mind when making your selection:

1. Market those which have been slow to feather or seem to lack vitality.
2. Keep the pullets which mature quickly and start laying first. Those which start laying when less than 200 days old will be the best layers if they have the right care.
3. Keep the late moulters.
4. Keep the birds with rather large plump combs and wattles.
5. Hens with pale vents, pale beaks and pale legs have been good layers.
6. The skin of the best layers should be rather loose and flabby on the abdomen between the vent and the breast bone.
7. The pelvic bone smust be thin, straight, flexible and wide apart.
8. Market the hens which are baggy behind and which have a heavy, fat, thick abdomen which hangs down below the point of the breast bone.
9. Keep the hustlers and heavy eaters that go to bed late and with full crops.
10. Birds that have long toe nails that show no signs of being workers are usually unprofitable.
11. If a bird meets the above requirements, it should have a broad back, long body, be stoutly built and in good flesh.
12. If a bird is not moulting and still has a small, dried-up comb covered with a sort of whitish substance, or if a bird has thick or crooked pelvic bones, which will be found on each side of the vent and above the point of the breast bone, these are always money lasers.

The best known methods of selecting the laying hen without the use of the trap nest is contained in lessons Nos. 10 and 11. It tells plainy how to weed out the sackers and how to breed to increase egg production. No man or woman can afford to feed a flock of drones at the present prices of feed, but the good layers will make more profit than in any previous year.

Environment and Feed Important

When a poultryman has made a careful selection as above, he then has a foundation on which to build. The next important thing is the question of feeding.

In speaking of wheat, we refer to shrunken wheat or wheat which is not suitable for milling. The Government will not permit the use of wheat for poultry feed and it is our duty to aid the Government in the enforcement of this law.

There is no questions but what corn wil lbe cheaper. When corn sells for less than wheat it can be used for at least two-thirds of the grain ration. I nthat case, as a scratch grain I would recommend two-thirds corn and one-third wheat. If barley is cheaper then use one-third barley. But use barley substitute for your corn rather than the wheat. If oats can be bought for less per pound than corn or wheat you can use one-third oats, providing they are heavy and are not composed mostly of hulls. If you expect to feed oat grain, it is best to soak your oats for 24 hours before feeding. At present prices or at what they are certain to be soon, use at least one-third cracked corn, and one-third wheat and you may make the other third of barley, or oats, if they are cheaper than wheat or corn. If not, then use two parts corn or two parts wheat

letting whichever grain is cheaper constitute the greater portion of your scratch feed. If you can secure, at a reduced price, wheat screenings, wheat which is shrunken, or which has been slightly damaged, but which is free from must or mould, it is often advisable to do this and mix it with your scratch feed. You can use all cracked corn for your scratch grain and wheat by-product for your mash.

Water As Important As Feed

One of the most esesntial things and one which is often neglected is to supply the flock with water. If the drinking pan is dry or frozen up, your egg yield is certain to drop. The egg is composed largely of water, so is the hen's body, and while water is one of the cheapest things yet it is one of the most essential things. By cutting down the water supply you can decrease your egg yield 50 per cent. in two days' time. Look well to this and try to make some arrangements whereby your water fountain can be kept from freezing this winter.

THE CO-OPERATIVE MARKETING OF EGGS IN NOVA SCOTIA

During the past five years the co-operative handling of eggs has received considerable attention in this province. We established, under the direction of Mr. Benson several co-operative egg circles in different parts of the province. Our conditions were not similar to Prince Edward Island conditions, and on that account the collection of eggs on any particular route was more expensive than in the Island. On this account, and owing to the local peddlers collecting a large portion in each district we decided to discontinue the egg circle as carried on there.

The Plan Adopted

Recognizing the fact that a large production of eggs was placed on the market during April, May and June, and also that a great number of these eggs were lost, we decided to adopt the plan of conserving the eggs by building cement tanks in different sections of the province as an experiment and collecting the eggs in the low price season and storing them in tanks with a preservative (sodium silicate), and during the winter season placing them on the market to help relieve the scarcity which exists during that period of the year. This was an advantage to the consumer and incidentally resulted in an average increase of prices for eggs produced in the spring to farmers. The system worked satisfactorily, and gave good results. During last year at three different points in this province we handled 16,000 dozen of eggs in this way. The circle selected their own collector and manager, and charged 4c. per dozen for handling and marketing the eggs so collected by the manager off the proceeds of the sale of the eggs. The balance was paid to the farmers after the eggs were sold. This method increased the spring prices to from 5 to 11c. per dozen. The eggs were candled into the tank, and also candled out of the tank into the cases for shipment, which enabled the circle to guarantee the quality of the eggs. We found some little difficulty in inducing the storekeepers to handle preserved eggs, but, after the customer had a shipment of these eggs, we were unable to supply all they required.

Attitude of the Department

Our Department assumes no financial responsibility in this matter. We agree to furnish the market and to assist in organizing the circle; all other work devolves upon the respective managers of the different egg circles. During the past season the prices during April, May and June were considerably higher than in other years, and on that account the circle managers decided of their own initiative that it would be advisable to preserve the bulk of the crop of the past spring. We will not, however, have at these circles as large a number to dispose of this fall. At two of the circles we have about 5,000 dozen eggs in the tanks.

The higher price of feed, and the difficulty of obtaining suitable foods for poultry, has caused a great many breeders and persons in town lots having small flocks to dispose of their flocks, and the production of eggs and poultry, as well as I can learn from reliable sources, will not be as large as last year by about 25%.—By J. P. Landry, Manager and Lecturer, Agricultural College.

EARLY PULLETS FOR WINTER

When we take into consideration that the average egg production on the Canadian farm is 75 or 80 eggs per hen and when well managed flocks average 120 to 180 eggs and individual hens even go higher than 300 eggs in the 12 months, it looks as though improvement might be made in the class of stock many keep. In the first place, purebred stock is best. They should be from a good laying strain. They should be from good healthy parentage and for winter egg production, pullets only and early pullets should be kept. In an experiment conducted at one of the Branch Experimental Farms where four different ages of birds were in competition for winter egg production, it was found that early pullets produced eggs at an average cost of 16.7 cents, late pullets at 28.2 cents; two-year-old hens 95.1 cents; three-year-old hens $.76 per dozen. iFgures somewhat similar to these could be procured in larger quantities. The early pullet is the only bird that shiuld be kept for winter egg production and it is the winter eggs that pay. Adozen of eggs at Christmas is worth two or three dozen in May or June. Early pullets mean early eggs and early chicks in the spring mean early pullets in the fall. As a rule, the pullets that lay earliest are the best layers so that every pullet that lays before Christmas should be marked. They are the best layers. If you are killing off your old hens, do not kill hens that moult late in the fall. They are your best layers and with your best layers should always be mated male birds from good layers. The male is more than half the flock. A male from a good laying strain and especially from a laying mother will do more good to build up the laying quality of the flock than any other one thing. Don't use them for breeding purposes, cockerels whose pedigree you know nothing about. Better pay a good price and get a good bird.

PEERLESS PERFECTION
The Fence For Real Protection
gives life time service. Is made of the best Open Hearth steel fence wire, all impurities burned out, all the strength and toughness left in. Makes the fence elastic and springy. Will not snap or break under sudden shocks or quick atmospheric changes. Galvanized to prevent rust and the coating will not flake, peel or chip off. Can be erected over the most hilly and uneven ground, without buckling, snapping, or kinking. Every joint is locked together with the well-known "Peerless Lock." The heavy stay wires we use prevent sagging and require only about half as many posts as other fences.
Send for catalog. It also describes our farm gates, poultry fencing and ornamental fencing. Agents nearly everywhere. Agents wanted in unassigned territory.

Winnipeg, Manitoba Hamilton, Ontario

HOW TO HANDLE NEW CONCRETE

All newly placed concrete work must be protected against the elements and against injury from other outside causes until the concrete has thoroughly hardened. In most cases thi sprotection need be no other than a covering of some sort which will prevent rain from falling directly on the exposed concrete surface.

Especial precautions must be taken to protect the concrete against freezing temperatures. There are various ways of doing this. The most effective and also the most usual and easily accomplished is to build a sort of covering over the concrete either of boards or canvas and place under this covering small stoves or heaters which are kept burning continuously until the concrete has hardened. The heat given off by these stoves will be sufficient to prevent the concrete from freezing, even though the canvas or board covering should not be entirely air-tight.

In seasons of extreme heat it is also necessary to protect the concrete against direct rays of the sun and direct exposure to the heat. Such exposure will cause the water in the concrete mixture to evaporate or dry out before the concrete has had an opportunity to harden, and thus an inferior concrete will be produced, particularly at the surface. The best way to protect the concrete against such injury is to keep it covered with water until it has hardened. In the case of pavements or floors, this is easily accomplished by building little dams of clay or other suitable material across the surface of the concrete and keeping the enclosed spaces filled with water for several days, or until complete hardening has been accomplished. In other cases where this method is not practicable the concrete may be protected by keeping the air in the room in which the concrete is located saturated with moisture either by means of escaping steam or fine spray of water.

The presence of water or moisture in the atmosphere will not in any way injure the concrete either before it has hardened or after. Before hardening has set in the presence of moisture in the air is exceedingly beneficial to the complete and thorough hardening of the concrete. After the hardening has been accomplished the presence of moisture in the air will not affect it.

The application of paint or other protective coatings to concrete work before it has hardened will cause it serious injury. This injury arises from the fact that the hardening process will be materially retarded by the admixture of any substance not properly a part of the concrete mixture. The concrete at the surface will also be materially weakened by this application and in all probability will peel off after the concrete below the surface has hardened. After the hardening process has been completed no protective coatings of paint or other material are necessary.

Save Sugar!

Don't use Sugar where Corn Syrup will serve your purpose as well or better. The ships that carry sugar are needed for soldiers and their supplies. Crown Brand and Lily White Corn Syrup are delicious, wholesome and economical alternatives for sugar in pies, puddings and preserves; as a sweet sauce and on cereals.

Use **CROWN BRAND CORN SYRUP**

The most nutritious part of the corn converted into its "sugar" or syrup form, with the added flavor of a little cane syrup.

LILY WHITE CORN SYRUP

For use where the Food Board Bulletin calls for Corn Syrup (White)
Delicious for table use and cooking.

WOMEN'S INSTITUTE SECTION

This section of the Maritime Farmer will be devoted to the interests of the Women's Institutes of New Brunswick. We respectfully solicit contributions from all branches, touching upon matters of general interest. We wish the members of all branches of the Women's Institute to feel that the Maritime Farmer wishes to fully assist them. The Maritime Farmer is the official organ of the Women's Institute of New Brunswick. We would suggest that YOUR BRANCH name a press committee, so that news from YOUR BRANCH may reach other branches.

Shout now! the months with loud acclaim.
Take up the cry, and send it forth;
May breathing sweet her spring perfumes.
November thundering from the north;
With hands upraised, as with one voice
They join their notes in grand accord;
Hail to December! say they all.
It gave to earth our Christ the Lord.

ABOARD THE "GRAY FLYER"

(By Lillian Ducey,

It began aboard the "Gray Flyer," en route for New York. The passengers in the Pullman Aida saw the beginning of it, while they were athrill with the Christmas spirit. Expectancy was in the air and fulfillment bulged from bundles heaped everywhere.

You know that feeling of anticipation. Everyone does. It belongs to Christmas and the days antedating it. For in that gift-giving, joy-seeking, joy-diffusing time anything can happen. You don't know what it is. You don't know what you'd like it to be. But just beyond, as it were, it's going to surprise you.

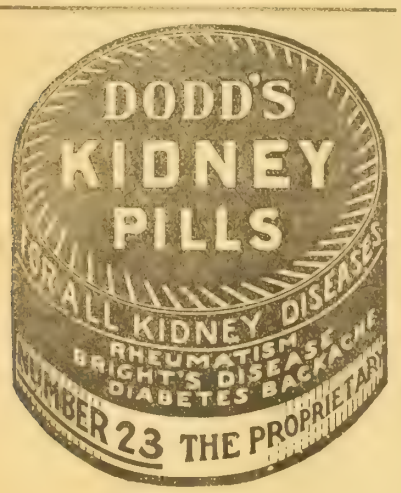
Even Brown felt that way—although he had no one in the whole wide world that he could call his own. And no one was more susceptible to that inspired sentiment that sweeps the land at this home-hallowed time. For Christmas, he would have told you, is a time when any one is privileged to rub elbows in the spirit with the gladness that is in any one's soul. So he sat in his chair in the Aida and he rejoiced in the holiday enthusiasm that bubbled forth when he saw the new passenger the conductor personally ushered into their midst.

Brown looked up, as did the rest in the car, attracted by that piping baby voice. The new passenger was a happy little maid of about four, and she hugged a battered doll to her breast like the veriest mother while she took them all into her confidence.

"I'm Felicia. —m-m!—yes, I am, I'm going on five. And this is Annabel Anastasia, 'most one year old. Christmas day is her birfday. See her! See her!"

The little voice was like a morning song. The face was a beaming smile. It contrasted oddly with the disfigured doll. And as the conductor put her into a seat she stood up on it and continued:

"I'm pretending I'm grown up. I'm great big. I'm taking Annabel Anastasia 'way, 'way by, far gone. Annabel Anastasia's got lots of other names too. Hasn't you—Oh-so-sweet? Hasn't you, Pretty-eyes?"



At that a glance of pure amusement went round. Annabel Anastasia's eyeless sockets were the reason.

Just here she caught sight of Brown across the aisle, and head tilted birdwise, she smiled into his eyes.

"Having a nice ride?"

Brown nodded and smiled back.

"You going a norphan asylum too—where there's lots and lots of little girls to play wif?" Like a tune that ran came the questioning voice.

Brown started. So, for that matter, did the rest who heard her. That little captivating beauty going to an orphan asylum. Through the joy of the Chirstmas mood shot a pang that pained.

"Won't it be nice to have lots of little girls to play wif?" the enchanted voice went on. 'And I'm going to one where Sister Anastasia lives. She knows us, I guess. She knowed my mother, too.' My mother's in heaven. And she took the eenty weenty wif her. Daddy wanted her, I guess. Now they're all in heaven 'cept me. When everybody you've got is in heaven you go to a norphum asylum and stay—and stay—and stay until——"

Suddenly there came a quiver to the baby lips. A mist gathered in the baby eyes. From over the back of the seat she looked down at a little boy who was about her own age.

"Has you got a mother—and is your mother in heaven?"

The question, unanswered, was left floating in the air. But the boy snuggled up to his mother; the mother held her boy jealously close. And in that moment Brown jumped to his feet as if something dynamic har started to life within him. Gruff with emotion, he held out his arms.

"Come here to me, Felicia, anad tell me all about it."

That was all he said, but more than one in the Aida marvelled at his tone. And more than one as the hours went by wondered what those two could find to talk about—the grave-faced man and the chattering little magpie on his knee. They saw her, when sleep crept drowsily over her, tuck her little face beneath his chin and smile herself off into dreamland. And every one's eyes seemed to grow thoughtful. Every one's expression held a hint of wistfulness. Every one's heart beat out a wordless prayer of thanksgiving.

The mother of the little boy realized how much she had to be thankful for. And behind her sat a little old lady—a tired little old lady dressed in black. She was a grandmother; she had raised a big family of her own, and now she was mothering her son's motherless half-grown girls. She prayed for wisdom to guide them aright.

On the other side, a fat, florid man, unmistakably a drinking man thanked the quite irreligiously that he'd had sense enough a couple of years ago to invest in an annuity for his wife and kids, even though his wife had left him on account of his habits.

While the prayer of another man was that the Lord would look after him until he could take out a good-sized life insurance, so the mite that had come to his house a week ago would never find himself traveling toward an orphan asylum.

Once the conductor came through and stopped to talk to Brown. "Can you beat it?" was the emphatic way he summed up the situation—the baby asleep, the man cradling her so willingly. And to cover the emotion that bothered his throat he said offhand:

'Parents both dead. I'm to deliver her to a sister from some charitable institution, who will meet her in New York. Hard lines. Mighty pretty little thing. Let me take her where the porter can watch her. She can finish up her nap over there, stretched out on that seat."

Brown then looked down at his little burden. The lips were still curved to a smile. Elfin breaths were being wafted his way. And with a puzzled look in his eyes he laughed up at the other.

"She's comfortable; I'm comfartable. Let her stay."

And when she woke she continued to stay with Brown. She could not be coaxed from him.

"I love you.", the rest would hear her say. "And Annabel Anastasia loves you. Would you like to kiss Annabel Anastasia?"

And quite seriously Brown would kiss the eyeless doll.

They had other poignantly interesting and familiar little talks as the train sped on.

"Have you a little girl like me?" Felicia asked once.

Brown shook his head.

"A little boy?"

"Nobody."

"No-body?" her little voice was soft with sympathy at the bond between them.

'Nobody." Brown repeated promptly. But even as he spoke, his heart dropped a beat.

For, you see, he did have some one. Right in that city to which he was traveling there was some one. Some one who— Well, briefly, he and that some one had fought their way through three years of life together. Fought, it, not with flatirons or pots or bootjacks, by the ancient method which bruised only the flesh, but with stnging words that started pounding pulses in the brain, and that rankled in the heart everlastingly.

They havn't been living together now for more than a year. Just before Christmas a year ago, they had their decisive battle and each had retired from the field—defeated.

He was graver than before when Felicia finally arrested his attention again. But she talked and talked. She claimed him. And when they finally reached New York and the conductor came to take her, she put her arms about Brown's neck and clung and clung and clung to him.

An illogical quickening of the heart of Brown was the result. For he actually felt as if a piece of that heart was to be taken away. Ah, if only he and Constnace had had a child. Perhaps then——

But he crowded back such memories and he said to the conductor:

"I'll carry her for you."

He tried to tell himself that after all it was part of the humane ordering of life that orphan asylums should exist.

He was now facing two black-robed sisters. He was talking to them. Felicia's arms were still glued about his neck.

It was if here in a world of strangers he was hers. And she wept her pitiful need of him. She told him Annabel loved him, but refused to

look at the namesake of Annabel Anastasia.

The sisters turned to Brown.

"Perhaps if you will come with me, Perhaps if we all went together—We'll take a taxi and——"

But it wasn't before the convent that the taxi drew up.

Before the sisters had time to protest they were entering the house. The door had been thrown open by some one who had seen them from the window. And that some one, with hand on her heart, had whispered softly, "Oh, Jim, Jim." in the voice of one who takes all her pride into one extravagant handful and tosses it away.

She ushered them into a lovely room. And Felicia, with the clairvoyance of childhood, held out her arms to her. And out of that silence Brown spoke.

"Constance, I've come to ask a great favor of you. In other words, I've brought you this little lady and I want to ask you if you would not like to have her spend Christmas with you. I met her on the train. She was bound to an orphan asylum—and you know how my heart aches for such homeless ones.

"I barely remember my mother—except the ache caused by her death. I, too, went to an orphan asylum. Until I was twelve years old I stayed there. One day when out walking we were scattered by what was presumably a mad dog that ran into our midst. That was my chance. I ran off. They never found me. And though at first I had to scrape for a living like some animal, afterward—Well, here I am. Just plain Jim Brown—but once this lady loved me enough to marry me. Think of it! I who have slept on benches in a park or in a doorway, wondering even in

Knit Socks and Dollars with the Auto Knitter

Profitable employment at home in war or peace time

Socks—more socks—the Soldiers' call! The hosiery industry is booming and the demand far exceeds the supply. Help us fill it but get away from slow hand knitting. Use the fast, reliable, modern Auto Knitter. We gladly take all the socks you wish to send us and pay you highly profitable prices.

The Auto Knitter is simple and easily learnt—and secures a big income for full or spare time work right in your own home and no previous experience is essential.

Write today for full particulars enclosing 3c stamp. See what good money you and your family can earn at home besides doing patriotic work.

my dreams what it must be like to have a home—wishing I were a man so that I could make one for myself. And then, having accomplishel this glorious thing, sullying it with my unbridled temper. 'Right her before you I want to tell my wife how sorry I am about that.

"Once you've been married you can't get away from it; it's too big a thing. Or if you do, the whole of the world is out of tune. It leaves its mark—living together."

As he finished speaking, a look quivered over the woman's face that hinted of tears.

'Felicia, how would you like to live with me—all the time? Be my little girl?" she whispered to the baby.

"And wif him?" Felicia's was a loyal little heart.

"And with him—yes," the woman affirmed tremulously—"with us."

SHARING SECRETS WITH THE SMALL FRY

Christmas is the children's holiday. If they have a part in the Christmas preparations and giving, they will enjoy it much more than if everything is done for them. It is a mistake not to allow children to help decorate the house and the tree, or to make and plan little gifts for family and friends. Of course one does not want to take away all the element of mystery from the Christmas season; but this can still be obtained in the method of distributing the gifts, and in surprise packages for the children themselves.

The small children can make paper kindergarten chains out of colored paper cut into strips and pasted, one ring within another. The strips should be cut about one half an inch wide and four inches long when making chains for decorating the rooms, and about one-fourth of an inch wide and two inches long for decorating the tree. These chains may be made of red-and-green, red-and-white, or green-and-gold paper. Chains made of silver or gilt paper are especially nice with which to trim the tree.

The small children can also string popcorn, unroasted peanuts, and cranberries on stout thread for tree trimmings. Pop-corn and cranberries strung about the room make nice decorations. If liked, the pop-corn and peanut strings may be touched up with a little gilt by some of the older children.

Save up all the scraps of gold and silver paper and tinsel. Bethlehem stars and crescents moons cut from these make pretty decorations for the tree, and may be made easily by the children. A pattern for the child to go by may be cut of pasteboard. These stars and moons are suspended from the tree by means of the tinsel, or gilt, or silver cord.

Give the small children colored Christmas and New Year post cards decorated with silver and gold bells, and figures of Santa Claus, and let them cut these out. They will enjoy this work very much. The cut-out bells are suspended from the tree. The Santa Claus figures, if preferred, may be pasted in the center of red or white pasteboard stars, hung on the branches.

The boys wil lenjoy frosting the tree, also the sprays of foilage to be used in decoration. Alum should be dissolved in a pail of water, using as much alum as the water will take up nicely. Then it may be put on the tree by means of a whisk-broom. The sprays may be dipped directly into the pail of alum water.

Girls will enjoy making stockings of tarlatan, and overcasting them with bright wool-worsted. These are filled with candy and nuts. Cornucopias may be made for the same purpose, also pretty boxes to hold home-made candies. With plain boxes, mucilage, wall paper, or other fancy papers they will evolve boxes that would do credit to an older person.

Children will enjoy cracking nuts and picking out the meats for the Christmas goodies, or gilding them for the Christmas tree. Acorns make ideal tree decorations.

There are many simple little gifts that the children can make with their own fingers, and every mother should encourage them to hava e part in the Christmas giving as well as the receiving.

Then there are many simple home-made sweets that the children can make. We know of homes where all the Christmas candies are made in the home by the youngsters, with the oversight of the mother or an older sister, and they enjoy these home-made goodies much more than bought candies.

They will enjoy dressing dolls, or making scrap-books for hospital children. To make some one happy is the Christmas spirit to instil into our boys and girls, and we can not begin too soon.

TABLE MANNERS

Table manners. like most of the conventions, are not arbitrary rules; they are based upon common sense. Back of every breach of table etiquette lies either a practical or an esthetic objection. A cup with a spoon left in it is in danger of tipping over. Biting one's bread, instead of breaking it, is suggestive of animals and therefore not pleasant to see.

Many parents teach their children not to smack their lips, not to lean their elbows on the table, not to be noisy at meals, and let the table-manners go at that. And when those children grow up, they learn the conventions at the cost of painful embarrasment and agonized self-consciousness.

A child of two is not too young to acquire the first principles of table etiquette. Explain to him the common sense of everything he must and must not do and if, for one reason or another, you allow him to break the rule, be sure that he understands what the proper thing really is.

All our teaching will be of no avail if we do not set him a good example. Grown-ups fall too easily into careless ways, secure in their knowledge of how to eat when they "go out." But a careless youngster carries his bad home manners with him.

There are children who seem absolutely incapable of keeping their "fronts" clean, without aid of a napkin tucked in the collar or tied around the neck. If such be the case, a mother is only courting trouble if she insists that he spread the napkin in his lap. Tell him that he must wear it "baby fashion" unti lhe has learned not to spill his food; as soon as he can aeat nicely, he may spread the napkin, folded once, on his lap, in the proper grown up way. This furnishes him an incentive for good manners.

Children falling into the habit of cutting up their meat into small pieces before beginning to eat, because, when they are very small, this is done for them by their parents. But as soon as a child can manage his knife, let him learn to cut off only one piece at a time "as mother and father do." It will save him embarrassment in later years.

In the same way, a child learns to butter a whole slice of bread, and bite into it. When mother stops buttering it for him, he imitates her method. Bread should be broken, not bitten off, into mouthfuls, each morsel buttered separately. This is not difficult for children to learn. It is based on good sense—for a bite into a buttered slice is likely to leave greasy traces around the mouth.

In a large family of children, where there is much passing of plates for a "second help" from one to another, it i soften the better part of valor to allow the owner of the plate to hold his knife and fork in his hand. A wise mother, however, will begin early to teach youngsters that the proper way is to leave the knife and fork resting on the plate, for well-mannered people can supposedly pass the plate without accident. Let the kiddies look upon this, and other points, as a grown-up privilege to which they may aspire, and they will need little urging to do their best.

When a knife or fork is not in use, it should rest wholly on the plate. At the end of the meal, the knife and fork should be placed together, the ends touching on the plate, but not crossed.

The child should not be allowed to leave the spoon in his cup, for this is a bad habit easy to acquire. Remember that everything that you can drill into him now is to save him future embarrassment. If, for lack of patience, you have failed to teach him good manners, be sure that he will blame you at some later date.

Eating soup noiselessly is easier when the liquid is taken from the side of the spoon than when sipped from the end. Also, it is not good manners to place the whole spoon in the mouth which a child is likely to do when eating from the tip.

At many tables, chicken bones, chops, etc., are taken up in the hands. This is quite permissable at a family meal, but it is well to train the youngsters into asking permission to "take it up in my hands," so that he may regard it as the exception, not the rule.

A child should learn to cut lettuce with his fork, without aid of his knife. He should learn not to scrape the bottom of a cup, not to clash his spoon or fork against a plate in an effort to clean up the last vestige of some favorite dish. If he must use a "pusher" let it be a piece of bread, not his fingers. He should avoid the habit of suspending a forkful or a spoonful of food in mid-air while he talks. When food is taken from the plate it should be carried directly to the mouth. At the close of the meal he should fold his napkin and ask to be excused.

RESEATING CHAIRS

When cane-bottom chair-seats have worn out, weave very strong cord across, knotting where necessary, then finish with dark shellac.

ECZEMA SPREAD
OVER ENTIRE BODY.

No rest night or day for those afflicted with that terrible skin disease, eczema, or, as it is often called, salt rheum. With its unbearable burning, itching, torturing day and night, relief is gladly welcomed.

It is a blessing that there is such a reliable remedy as Burdock Blood Bitters to relieve the sufferer from the continual torture and who can get no relief from their misery.

Apply it externally and it takes out the fire and itch and aids in the healing process. Take it internally and it purifies the blood of all those poisons which are the source of skin eruptions.

Mr. Andrew Bowen, Highland Grove, Ont., writes:—"I must say that Burdock Blood Bitters is a wonderful preparation. I had a very bad case of eczema which spread almost over my entire body. I tried doctors, home treatments and many other patent medicines, but with no results. A friend advised me to try B.B.B., and after taking five bottles, I am thankful to say they cured me completely."

B.B.B. is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send FREE to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Address

Mrs. M. Summers
BOX 309 WINDSOR, Ontario

NEVER TROUBLED WITH CONSTIPATION

SINCE TAKING

MILBURN'S LAXA-LIVER PILLS.

Too often one is liable to dismiss constipation as a trifle. It is not. When you allow your bowels to become clogged up, there pours a stream of polluted waste into the blood instead of it being carried off by nature's channel, the bowels, and when this waste matter gets into the blood it causes headaches, jaundice, piles, liver complaint, sour stomach and many other troubles.

By taking Milburn's Laxa-Liver Pills you will find that the bowels will be kept regular in their action, the poisoning of the blood and general weakening of the system is rectified, and the entire body is restored to normal condition.

Miss Elsie Zimmerman, Thedford, Ont., writes:—"I have used your Milburn's Laxa-Liver Pills for constipation, and have never found myself troubled since. I am very glad to have found something to cure me, and will always tell everyone about them who is troubled in the same way as I was."

Price 25c. a vial at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

THE IMPORTANCE OF SOCIAL LIFE IN COUNTRY HOMES

There is a belief abroad that we should try to make our neighbors good. Perhaps we would be nearer the Divine plan if we say we should endeavor to make ourselves good and our neighbors happy if we may, for happiness is the soil in which the gentler virtues take root. Unhappiness caused by another's injustice produces oblique mental vision. Much unkind and unjust criticism has been directed towards the elder brother of the prodigal son because he did not join in the festivities when his brother blew in gaily after a long absence and became the guest of honor at an informal gathering. It was too bad that he did not feel like joining in the party, for parties were not often held at his house. When he got a chance he told his father a few plain truths on the subject of social life in the neighborhood. "Here I am," he said, "a hard working, law abiding, self sacrificing, decent son to you. You never made a spread like this for me." No wonder he though it paid to break the commandments. And therein came the greatest harm to the elder brother. He looked at moral subjects obliquely. That is what the neglect or injustice of parents always brings about. They blur the moral vision of their children. The history of the elder brother has been duplicated many times in effect, if not in incidents. The cry goes up from many a boy and girl. "Long years have I served and still I have never been given a real party, not even a taffy pull, nothing at all to show that my efforts have been appreciated." Perhaps there is not any sadder thing can be said by any man or woman looking back on life than, "I never had a good time at home." Some of the saddest sights in the world are the sour, gloomy, stingy, grumbling, unhappy homes whose fire never brightens with a hospitable glow of "going to have company at our house tonight," and they are not always poor houses either. Some of the most downtrodden, hard worked children I have ever known, who help in the harvest and pick the potatoes and do chores are children of well-to-do parents. Don't ever think for o minute that it is the poor homes that are unhappy homes. You may feel sorry sometimes that you are not able to give to your children some of the good things of life, but there is one thing you can give them if you will—give them a happy childhood. Remember two dollars spent on their happiness now will bring greater results than two thousand when they grow up. Many a man and woman when they have grown up to the age of you and me and are up against the serious things of life have found their hearts made strong for the conflict and found that their hands were strengthened by looking back at the pleasant valley of childhood and in fancy wandering again down its rainbow paths. More children are defeated by what is behind them than by what is ahead of them.

How much more resourceful are the children in the country than the children in the small towns; the country women are more resourceful than women in the towns because they must plan for themselves. There is a great opportunity for doing a great deal for the people. Farming may be interesting or monotonous and dreary, according to the mental ability of those engaged in it. In some neighborhoods I have known, there was always something doing; in others there was always a round of driv elling gossip. There was not so much difference in the people as in the atmosphere in which they lived and their mental attitudes towards moral issue. One family of generous social instincts and strong moral character can raise a whole neighborhood to a higher level provided they get in on the ground floor, but if a neighborhood is established, it is pretty hard to change it. Set the social standards high. Let your social events have an aim and purpose. Don't you know it does not make so much difference how fast you are going as in what direction? It is better to aim high and go slow than to aim low and go fast.

There is a tendency for middle aged women to become discouraged and feel that they are in the way when it comes to social life. We hear so much about young people and young people's movements that the middle aged ones think there is not just the place for them that there is. If mother is not in favor of holding a party or doing something in that line, it cannot go on. In entertaining in her own home a woman finds her place. Mother is then the presiding genius.

There is another great reason for social life. Everybody is lonesome. Prairie lonliness is next to prairie madness. A lonely woman on the prairie needs human companionship—real life companions, something with a "skin face." One of the drawbacks to social life in a country neighborhood is the distinction of class and caste. I have known of people to refuse to associate with their neighbors for no apparent reason. They had an inward satisfied conviction that they were better than the rest of the community. Grandmother had been a "lady" and they could not forge it. Of course, I think it is fine to remember your forefathers with pride, but if this remembrance leads us to be unkind and unnatural, it becomes a bad form of snobbishness. Let no one aim at belonging to the pretty aristocracy with the best part under ground. I like the attitude of the real English, Scotch or Irish lady. How kind and courteous they are to everyone. They are so well assured of their own position that they do not have to think about it. It is those who are not very sure where they stand in society that are always very careful.

There was a delightful freedom and hospitality in the old days when everybody had packing box furniture, tin spoons and salt pork. No, of course, we do not regret the passing of those things, but we do regret the losing of the comradeship and freedom of the early days. In these days of cut glass and hemstitched linen we make our hospitality a fearfully burdensome thing. We are so anxious to have everything done up right. Be glad if you have cut glass, Limoges china, sterling silver and all those nice things, but regard it as something that is going to help us to serve our fellowman, for that is our business here below, to be the cup of strength to some soul in agony, to help some one over a rough place, to make things easier for the people who travel with us. That is an ambition worthy of those who are made in the image of God. Sometimes we say, I like to entertain my own friends, people who are congenial with me. How can we ever be sure that any person is dull. Probably it is our lack of interest. To the truly great heart all people are interesting. There is not a single person from whom you cannot learn something and from whom you cannot get a lesson, who knows something that you do not know. Let us seek out the people whom we in our shortsightedness think uninteresting. The truly great person is the one who will seek out those whom the rest of the world wil lbe inclined to pass by. Did you ever notice the dusty gray pebbles on the shore of a stream? How dull and uninteresting their colors; but when they are covered with the water of the stream what pretty blues and purples come to light. Bathe them in the sweet light of understanding and love and friendly interest and we see their lives shining with the beauty of unselfishenss and sacrifice and worthy endeavor. Let us make it our mission that we try to see every person with eyes of love, see the good things in them and in our own immediate neighborhood, for that is the part that counts. Let us try to seek out those that are dull, and incidentally our lives will be enriched a thousandfold.

CONDIMENTS, SPICES AND FLAVORING

(From the Modern Priscilla)

What life would be without a smile, food would be withou flavor. We cannot live on smiles and equally we cannot call condiments food—yet they do contribute essentially to nourishment because they make nourishing food enjoyable.

It is important that we use only pure condiments, spices and flavorings. Beware of the unknown peddler who comes to your door with a plausible tale of large packages at small prices.

Adulterations to these three classes of food adjuncts is easy; therefore it is necessary to know that your purchases are standard goods marketed by reliable dealers.

Message of Hope to the Old Folks

ISIDORE COMEAU SAYS DODD'S KIDNEY PILLS CURED HIM

Though Sixty-eight Years of Age, His Kidney Disease is Completely Gone, and He Gives All the Credit to Dodd's Kidney Pills.

Green Point, Gloucester Co., N. B., Dec. 1st. (Special.)—"I am sixty-eight years of age, but well and hearty.

"You can tell everybody that Dodd's Kidney Pills cured me of kidney disease completely.

"I want everybody to know how thankful I am to Dodd's Kidney Pills."

Thus does Mr. Isidore Comeau, well known and highly respected here, express his gratitude to the remedy to which he gives the credit of making him well. And his words are a message of hope to the men and women of Canada who are nearing the allotted span of life.

It is the kidneys that first feel the wear and tear of a long life. Theirs has been the work of keeping the blood free from those impurities that are the seeds of disease.

Nine-tenths of the ills from which the old folks suffer are directly due to weak or diseased kidneys. Ask your neighbors if Dodd's Kidney Pills are not the remedy they have been looking for.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters. I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days' trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

8 Big family game consisting of Checkers, Chess, Dominoes. New game of Autheurs, Fox and Geese, Nine Men Morris, The Spanish Prison and the game of Flirtation, all for 10 cts. Best value. 25 Big Silk remnants for fancy work for 10c. 10c
ALLEN NOUVEAUTIE, St. Zacharie, Que

rope to a chanc of "salt, vinegar, mustard, pepper" (jumping as fast our legs would move at the last word.) We did not know that we were training ourselves for later housewifely skill by thus memorizing a list of the condiments.

Salt is the most necessary of the group, and especially essential to those who eat little or no meat. It is obtained from mines of salt crystals or from sea-water by evaporation. It is agreeable for its own flavor and it brings out other flavors too. A pinch of it improves most things—cocoa, cake, and fruit jellies for instance.

Vinegar is used for its flavor, as in salad dressings and for the preservative qualities, as in pickles. It is not an antiseptic, like some of the spices, but the acid in it prevents decay. Two varieties of vinegar, one made from cider and the other from wine, are in common use in this country. White wine vinegar contains more acid than cider vinegar, and also some of the mineral salts of the grape.

Mustard has been used for centuries in medicine, but its table use datesonly from about 1830. To make it, small seeds of the mustard plant are ground to a fine flour. The most common adulterations of mustard have been the addition of wheat flour to texture and of cayenne pepper to make it "hot."

Pepper is one of the oldest condiments. In the days of Neroit was worth its weight in gold. As late as the Middle Ages it was so precious that mariners went voyaging to find a cheaper route to procure it.

Black pepper is made from the berry of a tropical vine dried before it has ripened and ground. White pepper comes from the same pepper corn fully ripened and with the black outer husk removed before grinding. It has a more delicate flavor than the less expensive black variety.

Red pepper is either the sharp strong cayenne, which should only be used with extreme moderation, or the mild, sweet parika. Parika is less widely uesd than it should be. Its flavor is excellent and it adds a delightful dash of color to many dishes. Sprinkled on top of creamed dishes or mayonnaise, hotel chefs have recognized its value for years as an appetizing touch.

The Spices

From the tropics we get all the long list of flavors which add so much to our enjoyment of food and to the variety which it is possible to have in serving it. Spices are also preservatives. The rich fruit cake which will keep a year owes its keeping quality to the spices it contains. Cinnamon and cloves are the most active antiseptics.

Flavoring Extracts

Vanilla and lemon are the best known and the most widely used.

European explorers found the Aztecs using vanilla to flavor the chocolate which was their favorite drink.

Lemon extract is made from fresh lemon peel.

Synthetic Products

One of the important discoveries of modern science is that wholesome condiments and flavors can be chemically produced. I have in my pantry today some salt which I made in a chemical laboratory fifteen years ago. It is white and sparkling, fine and delicious. It has never absorbed the least particle of dampness. It it were not made from such expensive chemicals it would be an ideal table salt.

In the same way, rrom various chemicals flavors similar to those derived from natural sources may be developed. Vanillin is one of these, and mapleine is another.

Condiment Mixtures

These are a convenienec to the busy housewife who has no time to dry her own herbs and make her onw mixtures of spices. They are skilfully blended for immediate use, and add much to our zest in the enjoyment or food flavored with them.

CURED HIS RUPTURE

I was badly ruptured while lifting a trunk several years ago. Doctors said my only hope of cure was an operation. Trusses did me no good. Finally I got hold of something that quickly and completely cured me. Years have passed and the rupture has never returned, although I am doing hard work as a carpenter. There was no operation, no lost time, no trouble. I have nothing to sell, but will give full information about how you may find a complete cure without operation, if you write to me, Eugene M. Pullen, Carpenter, 5543 Marcellus Avenue, Manasquan, N. J. Better cut out this notice and show it to any others who are ruptured—you may save a life or at least stop the misery of rupture and the worry and danger of an operation.

REFUGEES SPEND MANY WEARY MONTHS ON ROADS

Fatigued and starving by many weeks of travel along endless roads of mud, with little or no clothing to protect them from the bitter weather of a Belgium autumn, and no food to give their frail bodies strength to face the trials of each new day, the refugees, old men, women and small children smown in this picture are seen passing through Rosendaal in Holland, where they have sought safety, comfort and protection from the devastation, death and starvation that would have been their lot had they remained behind.

Day by day the same moving spectacle is to be witnessed along these roads that lead from Belgium into Holland, thousands of old men, women and children pass this way more dead than alive. The suffering of these refugees, these infirm old men, these famished mothers with children at their breasts and these little mites barely able to walk, but who, through rain and cald, wind and storm have trudged hundreds of miles to escape the misery and want and almost certain death that lurks in their own land.

Most of these refugees have been on the road a month, six weeks or even two months. The fatigues of the journey were too much for some of them and the weaker ones died on the roadside, some from exposure and lack of nourishing food, others from afiections caused by the cold and internal maladies.

Many pathetic incidents occurred during the march. Among the refugeees reaching Rosendaal was a young mother with the body of her six months old baby clasped to her breast. The babe had died four days previously, but the mother refused to bury the body in the soil held by the enemy. An old woman from Cambrai travelled for three weeks in a chair tied to the end of a cart. She was too old to walk and sacrcely had she reached neutral soil when the cart overturned and the woman was killed.

And so the endless sufferings of the refugees from Belgium might be recounted without number, and for the thousands that have so far been able t oreach Dutch territory, where everything possible is being done to nurse them back to their former robust health, there are thousands upon thousands still in Belgium who today without help of any kind. Wherever possible food and clothing is being distributed to the suffering population in Belgium by the different centres of the Belgian Relief Commission but the resources of this fund are being severely taxed, and unless still further help is forthcoming from outside centres, the civil population of Belgium will still further be depleted by agonized deaths from slow starvation. A little sacrifice on the part of the people of North America will save many thousands from an unknown grave and bring them back to life and happiness. So much can be done at so small a cost. Send your contributions to your local relief committee or direct to the Central Committee, 59 St. Peter St., Montreal, Que. For four years these people have lived in bondage, today is the day of their liberation. Won't you help them?

Before Breakfast

Do YOU take a cup of tea first thing in the morning? A great many people do, and know well its beneficial effect. They say it clears the head, and fits them better for the day's work. But at this time particularly, the Tea used should be of *Choice quality* and *purest flavor*. KING COLE Orange Pekoe is eminently fitted for this special service. It is indeed "The 'Extra' in Choice Tea".

Ask your grocer for it by the full name.

SOLD IN SEALED PACKAGES ONLY.

KING COLE ORANGE PEKOE

THE EXTRA in CHOICE TEA

TESTED RECIPES FROM RICE FLOUR

Griddle Cakes

3 cups rice flour, 2 teaspoons baking powder, pinch of salt, 1 tablespoon syrup or sugar, 1 egg, Milk to make usual batter.

To use sour milk or buttermilk, use one teaspoon baking powder and soda in proportion to sourness of milk.

Mix in order given and beat well. Bake on a hot griddle and serve with syrup. None better.

Rice Muffins

Very scant ¼ cup butter or other fat, 1 egg, 2 tablespoons sugar, 1½ cups rice flour, 2 teaspoons baking poyder, ½ teaspoon salt, about 1 cup milk.

Cream the fat. Add the eggs and sugar which have been well beaten together. Sift flour, baking powder and salt and add gradually with the milk. Beat all well and bake about twenty-five minutes in well greased muffin rings.

PUMPKIN RECIPES

Baked Squash or Pumpkin

Break the squash or pumpkin into pieces o funiform size. Wash the pieces, removing seeds and strings. Place with the skin up on triveets, which may stand in any baking-tin. Bake in a moderate oven until soft. Remove the pulp from the skin. Season with salt, sugar, and butter.

Squash Biscuits

Mix two cups of sifted flour, three ane one-half level tablespoons baking ing powder, one tablespoon sugar, and scant level teaspoon satl. With finger tips work in two tablespoons butter and one and one half of lard, add one and one-half cups of cooked, strained squash and one-half cup milk. Pat and roll lightly on floured board, less than one inch thick, shape with biscuit cutter, place in buttered pan, and bake in hot oven fifteen minutes.

Pumpkin Pudding

One cup of cooked pumpkin and stewed tart apples, half cup breadcrumbs, half cup sugar, beaten with the yolks of two eggs, half cup of stoned and chopped raisins with one-half teaspoon of cloves, cinnamon, nutmeg and ginger, and one cup rich milk. Bake in a quick oven for half an hour and spread with the frosting made of the whites of the two eggs, a scant cup of sugar, and a few finely ground nuts. This is delicious.

Canned Squash or Pumpkin

Pare, cut in small pieces, and cook until easily mashed very smooth. Pack in jars in a boiler, and cover with cold water. Boil for two hours and repeat this for two days. Thoroughly cool before putting away in a dark place.

Pumpkin Fritters

One pint of cooked, finely mashed pumpkin, two well beaten eggs, half teaspoon salt, a little ginger, one tablespoon of sugar (molasses will do,) one pint of milk, and flour to make a stiff batter. Drop on an oiled griddle and saute a delicate brown.

Pumpkin Timbales

Two cups cooked pumpkin, the well-beaten yolks of four eggs, one teaspoon salt, and one saltspoon of pepper. Mix well and fill timbale cups. Set them in boiling water and bake in a quick oven.

Preserved Pumpkin

Peel and slice into small pieces and drop into a boiling syrup of one quart, each, of water and maple syrup, and a sliced lemon. Boil until clear and tender, put in jars and cover well with the syrup.

Pumpkin Marmalade

Select a choice deep yellow pumpkin, cut into pieces, removing all "strings," grate on rather coarse grater and mix with an equal weight of sugar, add the juice and grated rind of an orange or lemon and boil slowly, skimming well and stir to prevent scorching until it is smooth and thick as usual marmalades. Fill jars or glasses while warm, seal, and keep in a cool place.

Pumpkin Butter

Take amount of cooked, well-pressed pumpkins as required and boil in the juice pressed from them, to the consistency of apple or other fruit butters, add sugar, and flavor to taste with cinnamon or any preferred spice.

Pumpkin Chips

Scrape and cut into real tihn slices, a choice, sweet yellow pumpkin, and to each pound add one pound sugar, a gill of lemon and orange juice, and th egrated rinds of both. Stir well and let stand overnight, cook slowly until tender, carefully lift from syrup and let stand until cool and firm, perhaps more than a day, then put in receptacles and pour the syrup over them.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

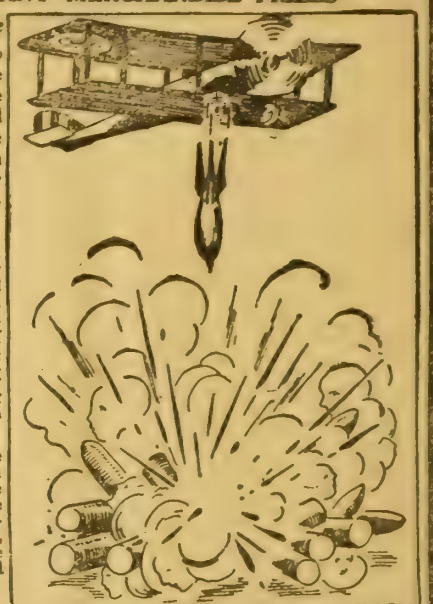
FREE PRIZE PUZZLE $4500.00

In Cash has been Given Away FREE also hundreds of Merchandise Prizes

$200.00 more IN CASH will be Given Away as follows

1st Prize, $50.00 in Cash. 2nd Prize, $40.00 in Cash
3rd Prize, $35.00 in Cash. 4th Prize, $25.00 in Cash
5th to 9th Prizes—Each $10.00 in Cash.

TOGETHER WITH MANY MERCHANDISE PRIZES



Herewith will be found the picture of an Aviator who has just dropped a bomb on a pile of Shells. At first glance the Airoplane and the Explosion appear to be all there is in the picture, but by careful study the faces of several soldiers will be found. There are 7 of them in all. Can you find them? It is no easy task but by patience and endurance can be accomplished.

You may win a cash prize by doing so. Many have done this as will be shown by the names and addresses which we will send you. If you find the faces mark each one with an X, cut out the picture and send it to us, together with a slip of paper on which you have written the words "I have found all the faces and marked them." Write these nine words plainly and neatly, as in case of ties, both writing and neatness are considered factors in this contest.

This may take up a little of your time but as TWO HUNDRED DOLLARS in cash and many merchandise prizes are given away, it is worth your time to take a little trouble over this matter. Remember all you have to do is to mark the faces, cut out the picture and write on a separate piece of paper the words, "I have found all the faces and marked them."

WE DO NOT ASK YOU TO SPEND ONE CENT OF YOUR MONEY IN ORDER TO ENTER THIS CONTEST

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not, and we will send you a complete Prize List, together with the names and addresses of persons who have recently received over Four Thousand Five Hundred Dollars in Cash Prizes from us, and full particulars of a simple condition that must be fulfilled. (This condition does not involve the spending of any of your money.)

Winners of cash prizes in our late competitions will not be allowed to enter this Contest.

This Competition will be judged by two well known business men of undoubted integrity, who have no connection with this Company, whose decisions must be accepted as final.

Upon receipt of your reply we will send a complete list of the names and addresses of persons who have won $4,500.00 in Cash Prizes in recent contests held by the publishers of this advertisement. Although these persons are entirely unknown to us, they are our references. An enquiry from any one of them will bring the information that our contests are carried out with the utmost fairness and integrity. Your opportunity to win a good round sum is equally as good as that of anyone else, as all previous winners of cash prizes are debarred from entering this contest.

GOOD HOPE MANUFACTURING COMPANY

46 ST. ALEXANDER STREET, MONTREAL, CAN.

PATCHING WITH THE MACHINE

Men's working clothes are, perhaps, the greatest bugbear to farm women. They are so heavy and stiff and uninteresting, and, somehow, always so in need. But if gone about rightly these neen not be so hard, and if done promptly and well a woman will largely lose her dread of them. Most of the work of mending such garments may be done on the machine. First, have them clean. Then, if it is overalls, and there are holes in the knees, rip up the inside seams nearly to the joining. Lay the open leg out flat on a table and pin the patch, amply large, over the hole on the outside. Then baste firmly in piace and sew down on the machine. Trim the ragged edges of the hole and sew turned down edge to the patch. Mend smaller holes over pockets and in seat the same way. Then sew up the legs again, sewing back a few inches at the bottom to prevent ripping. If jacket and sleeves are ragged, cut ofi worn part, and using removed portion for a pattern cut a new part, make on machine and sew on. Fronts may usually be patched the same as overalls. But once a garment of this sort is mended in this way it will seldom pay to do much more with it when it comes to rags again. Shirts do not usually pay to patch extensively, especially in the summer time. Where backs give out first a lining of cheap muslin sewed in on the machine may be profitable, and snags and tears should always be repaired; but aside from this better spend one's time otherwise.

WHAT CAN I GIVE HIM?

"What can I give father?" I was asking myself one Christmas in despair, when father himself solved the question. He is superintendent of a large iron-works, and found that his constant coming and going in the shops resulted in an ugly deposit of grime in the links of his watch-chain. So he asked me to knit him a watch-guard of black silk.

The making was simple. Eight stitches were cast on, and after the first row, "slip one, knit seven," in plain garter-stitch, was the only formula to be remembered. The strip was double the length from vest buttonhole to pocket, with a scant ertra inch allowed for the "looping through."

When finished, the ends were joined flatly, with the loose end of silk remaining after casting off, used as the sewing thread. If preferred, the ends might be fastened to a watch-bar of metal, which is to be passed through the buttonhole.

As for the cost, a forty-cent half-ounce spool of standard grade knitting or crochet silk will make several—easily three or four. A pair of steel needles, number twenty, are the right size, and wil lserve indefinitely, if kept from rust.

Such a guard is handsomer, stronger and more lasting than any silk ribbon or woven cord. And being elastic my father told me, it was less apt to jerk the watch out violently, if it should catch in anything by accident.

No sooner was the first one finished and in use than my brother announced that he, too, ought to have on like that. Now nearly twenty years after, a Christmas list without one or more

watch guards on it would seem impossible.

A week or two ago, the third generation openly hinted that shoestrings may be strong, all right, but aren't much for looks, while a piece of black ribbon wears out and—don't I suppose I could knit one of those about twenty inches long——

Of course I can!

FIVE FILTHY FINGERS

Did you ever make a diary of your fingers? Did you ever set down in cold black and white the things your fingers touch every day and did you ever consider the number of times daily that your unwashed fingers seek your mouth?

When surgeons discovered that it was their own infected fingers which carried germs into wounds, they set about trying to discover a means whereby their hands could be rendered surgically clean, i. e., free from germs. The whole realm of chemistry was ransacked for agents which would disinfect hands, and the scrubbings and immersions to which they subjected their hands are even yet a tender memory to the surgeons of that period. But all of these ecorts proved useless and at last in despair surgeons took to wearing rubber gloves which could be boiled, thus bringing to each patient, as it were, a fresh pair of sterile hands. In other words, try as you will, you can't by any known method make your hands absolutely clean.

How Germs Are Carried

The great agent in the spread of those diseases whose causative organism is present in the secretions of the mouth and nose, is the human hand; and if saliva was bright green we would be amazed at the color of our fingers. As a matter of fact most of us carry our fingers to our mouth or nose many times daily, there to implant the germs of disease which other careless people have spread about, there to collect a fresh cargo of infectious material to scatter for somebody else.

It is true that most germs of disease die quickly once they leave the human body, but what does the death of a few billion germs matter so long as the supply is copious and never ending.

What an enormous number of infected things we touch during the day and how infrequent and cursory are the hand washings we perform!

The answer is to keep your fingers out of your mouth and nose. Thus we limit the spread of disease from those orifices at least, thus we eliminate the danger of contracting disease from sonmeone who was not quite so careful.—Reprinted from the United States Public Health Service.

SELECTING CLOTH FOR WINTER SUITS

In selecting cloth materials for winter suits and dresses do not be "penny wise and pound foolish." Remember that such materials have much labor put on them in the making, and that they are capable of hard wear when of good quality. For this reason get a fair quality, as it not only outlasts an inferior one bue also retains its freshness much longer. Judge for yourself of the quality by examining the texture, and avoid all sleaky, loosely woven stuffs, as they will sag and are apt to fray as well. Another thing; know how much you require before purchasing. In buying materials costing the present prices a very small piece too much proves expensive.

The woman who does her own sewing, or has a seamstress come to the house, will find considerable saving in buying needles, threads, buttons, seam bindg ,feather stitching band, and the things of like character, by the dozen —with the exception, perhaps of colored threads. These being used to match certain dresses should be purchased as they are required. If you make underwear at home, buy longcloth by the piece, as well as beading and wash ribbon.

"I know exactly what is the matter with you, Jack. You have lost confidence.

"YOU were getting along fine until you had that nervous breakdown, but since then you have been worried and anxious.

"Now you have got discouraged and down-hearted, and it is no wonder you cannot make sales.

"The salesman must have lots of energy and vigor as well as confidence in himself and what he has to sell.

"But you cannot have confidence in anything so long as your nerves are weak and you spend the nights worrying instead of getting good, refreshing sleep.

"Take my advice, boy, and go straight to the drug store and get half a dozen boxes of Dr. Chase's Nerve Food. Then make up your mind that while you are using this you will get out into the fresh air all you can and forget to worry.

"Now, you may feel pessimistic after all the treatments you have been taking, but I know what I am talking about.

"My nerves were in a worse condition than yours ever were. I could scarcely get a wink of sleep, and did not care whether I got anything to eat or not.

"Besides, I got so irritable and downhearted that nothing seemed to go right.

"The experience that I had enables me to sympathize with you now, and also to say that I am certain that Dr. Chase's Nerve Food will help you.

"It is entirely different to most medicines used for the nerves, because instead of merely stimulating the tired nerves to over-exertion, it nourishes them back to health and vigor.

"Now, Jack, you must give the Nerve Food a trial, and I know you will consider me your best friend for telling you about it."

Here is an interesting letter from another business man who had a similar experience with Dr. Chase's Nerve Food :

Mr. W. J. Wilson, Grocer, Perth, Ont., writes : "In fitting up this building for a grocery business I worked very hard, and after putting in my stock I continued plugging away, good and hard, too. I commenced to feel myself going down—my weight went from 180 pounds down to 154 pounds. My appetite began to fail, and, of course, upon retiring I could not get a good night's rest. Sometimes after going to sleep my nerves would twitch, and I would waken up with a start, and then lie awake for hours. I remembered having used Dr. Chase's Nerve Food before, so I started in again, and took a good treatment, using about half a dozen boxes. I soon felt my appetite returning, I could sleep well, and commenced gaining in weight, until I felt like a new man. From the benefits I have received from the use of Dr. Chase's Nerve Food I cannot speak too highly of it."

Dr. Chase's Nerve Food, 50c a box, 6 for $2.75, all dealers, or Edmanson, Bates & Co., Limited, Toronto. Look for the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author, on the box you buy.

TO CLEAN AN OILED MOP

These mops lose their efficiency when they become too dirty and caked with dust. They may be washed in strong, hot suds, but this can be dine much better if the mip is first washed in gasoline ti cut the oil. Gasoline which has been used for cleaning should be saved for this purpose. After the mip is well washed in gasoline let it dry, then wash in suds. Then when thoroughly dry, oil it again and it is as good as ever. The best way to apply the iil is to piur a little in the tin box mop comes in, and put the mop with the strings down into the can and let it remain for a few days to evenly absorb the oil.

SUPPLIES FOR ENTERTAINING

One medium sized loaf of bread will cut in twenty slices for sandwiches.

One mediumt layer cake will serve twenty.

One gallon of ice cream will serve twenty.

One gallon of ice will serve twenty-five.

Three quarts of wine jelly will serve fifty.

A ten-pound turkey or twelve pounds of chicken with fifteen heads of celery will make salad for fifty people.

Two quarts of bulk oysters will make one large pan of escalloped oysters and serve twenty.

One pound of coffee will serve thirty-five.

When spreads show signs of wear along ends, sew a piece of firm, white material across the thin portions. Very old spreads can be made into splendid bath towels. When sheets begin to wear thin in the middle cut them in two and sew the outside together so that they will come to the centre, hemming the outside edges.

MARKETS.

MONTREAL

COUNTRY PRODUCE

Montreal, Dec. 1st.

The feature of the egg trade today was the stronger feeling in the market for strictly new laid stock, and prices were advanced 3c per dozen, which was attributed to the steady increasing demand for the same, and the continued limited supplies coming forward, and sales in a jobbing way were made at 68c per dozen. There was no change in the condition of the market for cold storage stock, prices being firmly maintained, with a good demand, and an active trade continues to be done. The receipts today were 1,100 cases, as against 1,979 for the same day last week, and 825 for the corresponding date a year ago.

We quote wholesale jobbing prices as follows:

Fancy new laid eggs.....00c to 70c
Strictly new laid.....00c to 68c
Selected fresh stock.....00c to 55c
Cold storage selects.....00c to 54c
Cold storage No. 1.....00c to 50c

Owing to the colder weather prevailing the receipts of dressed poultry were larger today, there being quite a few small lots on the market, for which the demand was good. Sales of good to choice turkeys were made at 36c to 38c per lb., and some poor lots were disposed of as low as 33c. Supplies of live poultry continue to come forward freely, but dealers say if the present cold spell continues the shipments will decrease, and dressed stock will be shipped in their place. The demand for the latter was good, and the trade on the whole was active, with no change in prices to note.

We quote prices for dressed poultry as follows:

Turkeys, per lb.....36c to 38c
Chickens.....25c to 30c
Ducks.....29c to 31c
Fowl.....23c to 29c

Owing to the colder weather a better feeling prevailed in the market for potatoes today, but there was no actual change in prices. The demand for local consumption continues good, and trade in a wholesale jobbing way was fairly active. The receipts were fair, and stocks on spot at present are ample to meet all immediate requirements. Sales of Green Mountains were made at $1.90, and Queec white stock at $1.70 to $1.75 per bag of 90 lbs. ex-store. Car lots of the former were quoted at $1.80, and the latter at $1.50 per bag of 90 lbs. ex-track. The tone of the market for turnips was firm, with a good steady demand for supplies, and sales of Quebec grades in a jobbing way were made at $1.25 per bag of 70 lbs. ex-store. The trade in onions was also fairly active, and prices were maintained at $1.50 to $1.75 per bag of 70 lbs. ex-store, as to quality.

A revised estimate of the Canadian potato crop from figures in possession of the Canada Food Board shows an exportable surplus in six provinces of 28,438,000 bushels over all requirements for domestic use and seeding. Alberta, Saskatchewan and Ontario have no surplus. Early frosts and prolonged drought reduced the yield below normal in these provinces. On the contrary, Quebec, New Brunswick and Manitoba show a remarkable surplus of 24,500,000 bushels. The balance of 3.933,000 bushels is in Prince Edward Island, Nova Scotia and British Columbia.

The seeded area of potatoes in Quebec in 1918 was 264,871 acres, as against 226,917 in 1917. The yield per acre in 1918 was 147 bushels, as compared with 80 for the previous year. The total yield in 1918 was 38,936,000 bushels, as against 18,158,000 in 1917. The value of the crop is estimated at $38,157,300, as compared with $25,058,000 for 1917.

The seeded area of turnips in the Province of Quebec for 1918 was 95,526 acres, as against 70,192 in 1917. The yield per acre in 1918 was 295.50 bushels per acre, as compared with 224.50 last year. The total yield for 1918 was 28,227,900 bushels, as against 15,759.000 in 1917. The total value of the crop for 1918 is estimated at $14,860,000, as compared with $9,298,000 for 1917.

New York, November 26—Eggs, firm. Receipts, 7,591 cases. Fresh gathered, extras, 73c to 74c; fresh gathered, regular packed, extra firsts, 71c to 72c; do. firsts, 67c to 70c; State, Pennsylvania and nearby western hennery, whites,, fine to fancy, 92c to 95c; State, Pnnsylvania and nearby hennery, browns, 76c to 80c; do. gathered, browns and mixed colors, 65c to 74c.

DAIRY PRODUCE TRADE

Montreal, Dec. 1st.

The receipts of butter today were 840 packages, as against 3,870 for the same day last week, and 439 for the corresponding date a year ago. At Gould's Cold Storage today the offerings amounted to about 200 packages, which sold at 49c per lb., f.o.b., country points. The feature of the local trade was the stronger feeling in the wholesale jobbing market for finest grass-made creamery, and dealers in some cases have advanced their prices 1c per lb., which is attributed to the smaller offerings of this grade of butter, and the steady increasing demand for supplies for local consumption, and sales of 10 to 25 package lots were made today at 51c per lb. in solid packages, and at 52c in 1-lb blocks. The trade in a wholesale way was reported rather quiet, and prices unchanged.

We quote wholesale prices as follows:

Finest creamery.....51c to 51½c
Fine creamery.....50c to 50½c
Finest dairy.....44c to 45c
Fine dairy.....40c to 42c

The receipts of cheese today were 2,736 oxes, as compared with 2,710 for the same day last week, and 4,402 for the corresponding date a year ago. At Gould's Cold Storage there were 2,000 boxes offered, for which the demand was good from exporters, and all sold at 24⅜c per lb. and 5c per bog, f.o.b., country points. The tone of the market for Quebec small cheese and twins is strong, and sellers today in some cases were asking 27c per lb.

The following prices are being paid by the Commission:

No. 1 cheese.....25c
No. 2 cheese.....24½c
No. 3 cheese.....24c

THE PROVISION MARKET

Montreal, Dec. 1st.—There are no further developments in the live hog situation, but the tone of the market is firm at the improvement in prices noted. The offerings were smaller, but they were quite ample to meet the requirements of the trade, and sales of long-run selected lots were made at $18.50, and short-run stock at $17.75 to $18.25 per 100 lbs. weighed off cars. The Winnipeg market yesterday was unchanged, with selected lots selling at $17.75 per 100 lbs. wegihed off cars. On account of the cold weather prevailing there was an improved demand for dressed hogs, and the undertone to the market was firmer. A fair trade was done in a wholesale jobbing way in abattoir fresh-killed stock at $23 to $23.50, and in country dressed at $20.50 to $22.50 per 100 lbs.

The condition of the market for smoked and cured meats was unchanged, prices generally being steady under a fair demand for small lots for local consumption and for shipment to country points. The demand at present is principally for bacon, of which supplies were ample and sales in a wholesale jobbing way of breakfast grades were made at 42c to 43c per lb. Windsor selected bacon at 45c to 46c, and Windsor boneless bacon at 48c to 50c. The trade in hams was rather slow, as is usual at this season of the year, with 8 to 10-lb. size quoted at 37c per lb., 12 to 15 lbs at 35c to 36c, and heavier weights at 34c. Now that colder weather has set in the prospects are that there will he an improvement in the movement of barrelled pork. There was no change in prices to note, car lots of American bean pork being quoted at $41 per barrel, duty paid; short-cut clear pork at $46, and clear-cut fat back pork at $56.

The demand for lard continues fairly good, and a fair trade was done in a jobbing way. Supplies were ample to meet all requirements, and prices ruled steady, with sales of Canadian pure leaf grades at 31c to 31½c to 31per lb. in 20-lb. wood pails, and at 32c to 32½c per lb. in 1-lb. blocks, while American compound lard sold at 27c per lb. in 20-lb. wood pails.

The receipts of provisi ns today were 810 packages lard, and 1,608 tinned meats.

HIGH BUTTER PRICES

Chicago, Dec 1st.—Investigations into the reasons back of the present unprecedented high cost of butter and eggs have brought forth assertions from produce dealers in Chicago that the farmer is receiving nearly eighty per cent. of the above-normal increase. The remainder was said to be divided among manufacturer, jobber, wholesaler and retailer. The best quality of butter in Chicago is selling retail at 73½ cents a pound, with strictly fresh eggs at 78 cents a dozen.

J. W. Low, president of the Chicago Butter and Egg Board, in a statement today, said the present high prices were the result of market conditions, and denied a charge of profiteering by either the producer or dealer.

MILLFEED AND ROLLED OATS

Montreal, Dec. 1.

A good steady trade continues to be done in all lines of millfeed, and the market is active, with no change in prices to note. There is considerable inquiry for car lots of most feedstuffs, but on account of the heavy demand for supplies at this season of the year from all over the country, millers generally are confining sales to mixed car lots, and they state that they have all they can do to fill the orders coming forward for the same. Car lots of bran were quoted at $37.25, and shorts at $42.25 per ton, including bags, ex-track, and bran at $39.25 and shorts at $44.25 per ton, ex-warehouse, including cartage, less 25c per ton for spot cash. Sales of broken lots of pure grain mouille were made freely at $68 to $70, pure oat mouillie at $64, barley feed at $60 to $62, and mixed moullie at $50 per ton, including bags, delivered to the trade. There was no change in prices for rolled oats today, on account of the reaction in the market for the raw material. The demand for broken lots was steady and sales of standard grades were made at $4.85 to $5 per bag of 90 lbs., and Golden cornmeal sold at $5.40 to $5.60 per bag, delivered to the trade.

New York, Dec. 1.—Butter, firm. Receipts, 6,543 tubs. Creamery, higher than extras, 67c to 67½c; creamery, extras, 92 score, 66c to 66½c; firsts, 60½ to 65½c; packing stock, current make, No. 2, 39½c. Cheese, strong. Ceceipts, 1,983 oxes. State, whole milk, flats, fresh, specials, 35c to 36c; do. average run, 34c to 34½.

THE N. B. BREEDERS CONSIGNMENT SALE

(Continued from page 134)

Minas Hero, 133505, contributed by L. M. Anderson, sold to B. Briggs, Pinder, N. B., for $100.00.

Baronet, 122468, contributed by L. M. Anderson, sold to Burton Agricultural Society for $100.00.

Bull calf, contributed by P. L. Fairweather, Rothesay, N. B., sold to W. P. Gallagher, Centreville, N. B., for $100.00.

Shorthorn Females

Lady Gray, 115998, contributed by L. M. Anderson, sold to F. R. Taylor, Rothesay, N. B., for $125.00.

Ruby, 103849, contributed by P. R. L. Fairweather, sold to W. S. Harding, Hammond River, for $220.00.

Heifer calf, contributed by L. M. Anderson, sold to F. R. Taylor for $36.00.

Heifer Calf contributed by L. M. Anderson, sold to F. R. Taylor.

Holstein Males

Faforit Csampion, 36849, contributed by Harding Bros., Welsford, sold to Arnold Carpenter, Carpenter, N. B., for $510.00.

Mercena Bill Abbekerk, 34308, contributed by Jas. Bremner, Jr., Chatham, N. B., sold to B. Briggs, Pinder, N. B., for $100.00.

Bull calf contributed by W. S. Harding, Hammond River, N. B., sold to Centreville Agricultural Society for $125.00.

Dickie Netherland, 26372, contributed by Thos. Caldwell, Florenceville, N. B., sold to A. E. Trites, Salisbury, N. B., for $100.00.

Holstein Females

Minnie De Kol Fayne, 60732, contributed by Harding Bros., Welsford, N. B., sold to C. C. Edgar, Three Brooks, N. B., for $86.00.

Heifer calf, contributed by Harding Bros., sold to Robt. Gray, Kingsclear, N. B., for $55.00.

Dutchess De Kol Faforit, 60731, contributed by Harding Bros., sold to Robt. Gray for $87.00.

Ayrshire Males

Gladstone Masterman, contributed by C. P. R. Farm, Fredericton Junction, sold to Murray Patterson, Lincoln, for $50.00.

Duke of Lakeville, 60057, contributed by E. M. Morse, Lakeville, N. B., sold to A. E. Trites, for $75.00.

Springbrook Prince Charles, 55901, contributed by McIntyre Bros., Sussex, N. B., sold to Frank Jardine, Quarryville, for $125.00.

Springbrook Prince George, 55902, contributed by McIntyre Bros., sold to L. J. Donovan, St. John, for $300.00.

Springbrook Doryeas, 60992, contributed by McIntyre Bros., sold to H. V. Dickson, Hammond River, for $120.00.

Ayrshire Females

Labelle D., contributed by McIntyre Bros., sold to Jasper Burnett, Fredericton for $75.00.

Springbroo kLily, 55900, contributed by McIntyre Bros., sold to Thos. Chatfield, Fredericton, for $80.00.

Mollie of Glenvale, contributed by McIntyre Bros., sold to Thos. Chatfield for $110.00.

Olive of Glenvale, 57238, contributed by J. A. Hughes, Petitcodiac, N. B., sold to H. T. Douglas, Stanley, for $135.00.

Ayrshire Cow, contributed by McIntyre Bros., sold to Thos. Chatfield for $185.00.

Sheep

Pair Oxford Ewes, contributed by Burder Goodwin, sold to A. C. Taylor, Salisbury, for $46.00.

Cheviot ram, contributed by N. B. Department of Agriculture, sold to T. G. Hetherington for $30.00.

Cheviot ram, contributed by N. B. Department of Agriculture, sold to Allen Turner, Dorchester, $36.00.

Cheviot ram, contributed by N. B. Department of Agriculture, sold to Allen Williams, Harvey Station, for $42.00.

Cheviot ram and nine ewes, contributed by N. B. Department of Agriculture, sold to Geo. King, Sussex, for $615.00.

THE SHEEP TICK—WHAT IT IS

(Continued from page 143)

a preparation having lasting properties, the sheep may subsequently pick up more ticks, but they will suffer little or no harm. It is the ticks that will suffer, finding the dip-impregnated fleece too unpleasant an abiding place, and, in consequence, they will do little harm to the sheep or to the wool.

When, however, the Ticks are allowed to become numerous and vigorous by neglect to dip with an effective

and lasting dip, they bring down the condition of the sheep, and check the growth of wool, causing much to be rubbed away and staining what remains.

Ticks and Lambs

The passing of Ticks from ewes to lambs at shearing time is a particularly serious matter, constituting one of the greatest losses in sheep farming. Ticks play havoc with lambs, giving them, at a crucial period of their lives, a check from which they never entirely recover.

It is necessary, therefore, to dip lambs at the shearing of the older sheep, before the Ticks which have migrated from the ewes have had time to deposit eggs in the lambs' fleeces. The importance of this practice is being increasingly recognised, as is only natural in countries where the lamb and mutton trade is of such vast importance.

As it is believed by some (though entirely erroneously) that poisonous Dips are too strong for young lambs, non-poisonous preparations are coming into use for them, and may suffice so long as the dipping is done before the Ticks have had time to deposit their eggs; but it is necessary to dip the lambs again before winter in a Dip, in order to secure the advantages of the protective qualities of which non-poisonous Dips have none, either against fresh Ticks coming on, or Ticks hatching in the fleece.

The soundness of this practice must be apparent to longwool and crossbred sheepowners, who will have observed how much more acute the Tick trouble always is amongst undipped hoggets as compared with adult sheep.

In dipping lambs at shearing time, especially when non-poisonous preparations are used, there is always risk of a certain percentage being disowned by their mothers. To avoid this contingency many sheepowners now defer dipping the lambs until after weaning, and their experience shows that the cost and trouble of this practice are trifling in view of the resultant advantages. Many sheepowners always thus dip lambs intended for ferezing before turning them on rape, and find that they derive immense benefit from it, avoiding, as they do, the loss of as much as a fortnight's feed.

It is scarcely to be expected that lambs, which are notoriously so sensitive and subject to the attacks of Ticks, con, when harassed by their presence, yield fully satisfactory returns for any feed on to which they may be put.

How Long Sheep Ticks Survive Separation From Their Hosts

Fully developed ticks were removed from a sheep, and protectively placed on grass, on October 22nd, 1910. On the evening of the 23rd, they remained alive, but on the morning of the 24th, they were all dead. On the 29th October, more ticks were removed and similarly placed. On the evening of the 30th, they were all alive, but on the morning of the 31st, some were dead, and in the afternoon, all were found dead. Tests, so far, therefore show that **sheep ticks can only live apart from their hosts, aobut two days.**

Age at Which the Sheep Tick is able to Produce the First Pupa

Experiments on this subject, so far, show that **a sheep tick becomes fully developed when about 12 days old.**

The Certainty With Which a Good Dip Will Kill Ticks

Two sheep, badly infected with ticks, were received into the pens provided for them, on the 3rd October last (1910.) One sheep was shorn and dipped, the second was dipped in its wool of nine months' growth. The shorn sheep was immersed for one minute, in a dip prepared from an arsenical dipping powder, according to directions on the packet, at 9 o'clock in the morning. At noon of same day, about 30 ticks were found dead upon the floor of the shed in which the shorn sheep had been placed. The following day (October 4th) a few live ticks were found on the sheep. On the 5th, one tick was seen alive, but on October 6th, **three days after the dipping, the sheep was found to be free from ticks.**

The sheep was inspected every day for 10 days, when it was artificially hand infected with live ticks, **all of which, in 26 hours, were found to be dead.** A week afterwards the sheep was again infected with live ticks, but after watching them 2½ hours, **it was seen that these ticks would not keep upon the sheep,** so they were killed.

The dipped unshorn sheep was perfectly free from ticks—with one immersion. Most of the pupae, (tick eggs) were rendered sterile, and the few that incubated, died.

These sheep were sent to the Quarantine Station on November 7th, 1910, where they were, at the date of the Report (July 21st, 1911), **absolutely free from ticks, and their wool in splendid order.**

The Protective Properties of a Good Dip

On the 2nd November (1910), two more ticky sheep were received. One was shorn and dipped in the same preparation, with the same time of immersion, with the same result—**all ticks died in 30 hours.** The other sheep was not dipped, but kept in the wool with the ticks on it.

After a lapse of ten days, and many inspections of the shorn dipped sheep, **which remained free from ticks** it was placed in the pen, with the undipped ticky sheep, and in half-an-hour, three Ticks were found on the dipped sheep, which was then placed by itself, and **in elss than 26 hours two of these Ticks were found dead and the other very sick.** The shorn dipped sheep was again placed with the undipped ticky sheep for three weeks, and **was not again found to be infected.**

Good Advice

After disproving the theory that ticks are spontaneously bred on the sheep, the Report concludes with the following pregnant advice to sheepowners—advice which, in the interests of their own pockets, they cannot too closely follow:—

"They (sheepowners) should not forget to be thorough in their work, and collect every sheep, and dip in an effective dipping preparation."

The practical results of the experiments described in the above summary, give singular force to the closing recommendations of the Chief Stock Inspector of Tasmania, who has probably had a longer and greater experience in cleansing sheep than any othr official in Australasia.

Observe the protective effects of **thorough immersion in a good Dip.** The sheep was rendered **immune from tick infection.** How often are flocks just "run," and even rushed, through the bath? It is not enough to merely wet the sheep in dipping; to secure lasting effects, **they must be thoroughly saturated with the Dip right down to the skin.** They must also have sufficient growth of fleece to carry away and hold the effects of the dipping; and these experiments also show that instantaneous destruction of the insects at the dipping is no criterion of efficiency. Indeed, a slowly acting dip is incomparably more lasting in its effects than preparations which mix instantly and kill instantly. Quick action and lack of lasting powers go together, especially in the action of sheep dips. Powder Dips are slow but sure.

Lasting protective properties, to ward off re-infection, are, therefore, the first essentials in the choice of a preparation for economic sheep dipping; and, in the dipping operation, immersion to saturation is indispensable to efficiency.

FERTILIZERS !

THE best potatoes grown in N. B. last year were grown with our best by test Potash Fertilizer.

We produce our high grade 2-8-2 and 3-6-5 brands expressly for N. B. potato growing, securing our own potash in Canada, all in water soluble form.

If you are using other makes of Fertilizers try as an experiment some of our brands alongside and watch results.

We produce a full line of Fertilizers. Write us for prices, terms, etc.

CONSERVING THE FARMER'S GREATEST ASSET IN MAINTAINING SOIL FERTILITY

(Continued from page 133)

much as it is convenient to store before hauling it to the field.

Value of Liquid Manure.—The figures in the accompanying tables, which are taken from Bailey's **Cyclopedia of American Agriculture,** clearly emphasize the wisdom of taking every precaution to prevent the loss of liquid manure. The amount of liquid manure produced as compared with solid manure will vary much according to the kind of feed being used and the age of the animal being fed. In some cases, the weight of the urine will be greater than the weight of the solid manure. In any case, the amount is sufficient to warrant the closest attention to prevent it being lost.

Saving Liquid Manure.—The simplest way to save liquid excrement is to absorb it by the use of plenty of bedding. Many materials may be used for this purpose but straw is likely to be the most common and available absorbent in Dundas county. It is quite commonly thought that straw in the manure is not as valuable as clear manure, but if the straw has been used to absorb the liquids it is more valuable than is generally supposed. Marsh grass, leaves, sawdust and shavings may be used for the same purpose. The two last mentioned should not be used in large quantities as they have no fertilizing value and lower the value of the manure. It is a good plan to have a quantity of fine dry soil or dried peat or much on hand to use in conjunction with the ordinary kinds of bedding. These earthly materials are valuable as bedding and have the added value of possessing the power to absorb ammonia gas as well as the liquids and so prevent the loss of nitrogen and help to keep the air of the stable sweet. Collecting the liquid manure and distributing it upon the fields by means of a tank with a sprinkling attachment has been practised to some extent, but this plan has not been found to be generally practicable. Ordinarily, more satisfactory results are obtained by using absorbents and plenty of bedding.

SOME ADVANTAGES OF DAIRYING

1. The sale of dairy products furnishes a steady income throughout the year. The farmer who depends upon crop sales for his income usually makes the bulk of his sales during one or two months of the year, while during the rest of the year he has no cash income. Such a system requires long credits in the community.

2. The market of dairy products fluctuates very little year by year as compared with other farm products.

3. Through the return of manure to the land the fertility and physical condition of the soil may be maintained at a high level and crops increased. Even after many years a properly maintained dairy farm has constantly increasing crop yields, instead of decreasing ones.

4. In dairying, labor may be utilized at a more uniform rate throughout the year than in nearly any other farm business. The grain growers, for example, may have to employ much additional labor at harves time, but as far as the dairy is concerned the dairyman has about the same duties to perform every month of the year. Thus, less help is required seasonally and permanent employees may be kept.

5. Through the dairy cow many unsaleable roughages may be transformed into products from which cash may be utilized. Grass, hay, corn fodder, and other roughage which may not have a ready sale, are economically utilized by the dairy cow. Land which is not suitable for cultivation can be utilized for pasturage for dairy cows. —U. S. Department of Agriculture.

PROVIDE FOR LIGHT AND VENTILATION IN DAIRY BARN

In the construction of a dairy barn, too much emphasis cannot be laid on the providing of proper light and ventilation. These two items are paramount as preventive measures against diseases, especially those of the respiratory tract, according to Wm. H. Feldman, of the Colorado Agricultural College. Mr. Feldman says: "Three to four square feet of window surface should be provided for each cow and the glass should be kept clean and not allowed to become covered with dirt and filth.

"A coww requires 59 cubic ft. of air per minute, or ',540 cubic ft. per hour. To provide such a quantity demands that a proper number of inlets and outlets of the right size be installed. To find the minimum number and size of the outlets and inlets, proceed as follows:

"By dividing the total cross-sectional area by the number of inlets and outlets the cross sectional area of each inlet and outlet may be determined.

"The ventilating system as devised by the late F. H. King is to be recommended.

"Multiply the number of cows by 59, divide by 300 and multiply by 144. The result will be the total cross sectional area of inlets and outlets required in inches."

BEST METHODS TO CLEAR LAND OF TREE STUMPS

Stumps occupy valuable land; foster the growth of weeds, for in order to keep the land in their vicinity clean much hard labor is necessary; mar the appearance of otherwise smooth fields, and hence reduce the selling price of a farm. They furnish shelter for harmful insects and animals and prevent the efficient use of modern machinery. The bulletin tells how they may be removed by burning, by explosives, by mechanical means, or by the combination of any or all of these three methods. There is no "best method" of ridding land of stumps, and the selection of a method for their removal should be determined only after a consideration of the facts involved.

Timber land that is not producing a profit and which is to be cleared is usually utilized as pasture for several years before stumps are removed. During this time the under brush is cleared up and many small stumps will entirely decay. If the weeds and sprouts in a pasture are kept under control native grasses will gradually establish themselves, even if no seeding has ever been done.

Care Needed in Burning

Destroying stumps by means of burning is an economical method and is widely practiced, but care should be exercised if this method is used in order to destroy the roots, so that they will not interfere with cultivation.

A common method of preparing a stump for burning is to dig two holes on opposite sides of the stump to a depth of about 30 inches. Generally connection is made at the bottom of these holes by digging away the wall of earth between them. Any adhering earth is scraped from the tap root and a fire started in one of the holes. If the fire is kept up it will burn most of the objectionable underground parts of the stump. Another method successfully used in the long-leaf pine area of the south is to dig a hole on one side of the stump, and with a 1½ inch or 2-inch auger bore a hole diagonally through the tsump from the opposite side to the bottom of the hole. A fire is then started in the excavation and the auger hole serves as a flue. A method largely used in the Northwest is to bore a hole horizontally into the base of the stump to a point a little ebyond the centre. Another hole is started as high up on the side of the stump as possible and bored

FERTILIZERS FOR 1919

We Supply Fertilizers for Every Crop and for Every Soil

Making two blades grow where only one grew before. By using Shur-Gain Fertilizers, you can increase your yields without additional land, labor, or seed.

For information and prices

Gunns LIMITED. ST. JOHN, N.B.

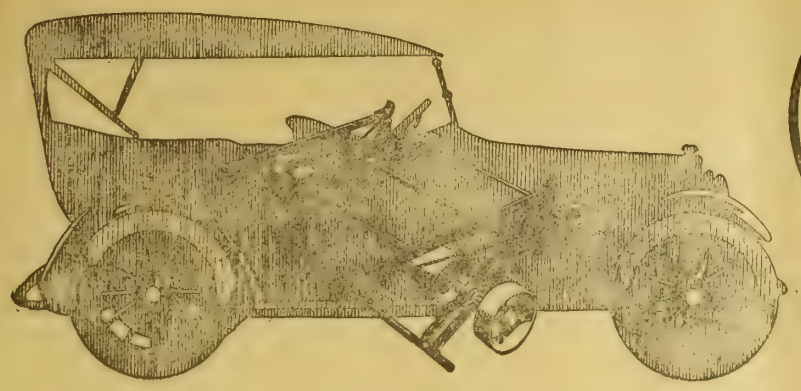
We would suggest the importance of an early order—it will give you the benefit of present prices and insure delivery.

Potato growers have denomstrated that commercial fertilizers scientifically used will yield a splendid profit.

We have just the grade that you require for your soil and can give you much valuable information.

We specialize on potato fertilizers and can fill your wants at prices that are worth investigating.

GUNNS LIMITED, 676 Main St., St. John, N. B.



"It Sure Worked Fine"

That's what one enthusiastic farmer writes after using LAY Porta Power on a 30-inch saw and an 8-h.p. feed grinder. Everywhere the comment is the same. LAY Porta Power is speeding up farm production, saving labor, earning profits.

LAY Porta Power puts your car to work on the farm. It gives you a new, economical, tireless hired man. It takes the power of your automobile and runs all the machinery around the farm—silo filler, feed grinder, pump, cream separator, saw, grindstone—anything.

LAY Porta Power weighs only 100 lbs. You can take it anywhere your car will go. Take the power to the job, not the job to the engine.

LAY Porta Power costs only a fraction of the price of a gasoline engine—and does as much work as any 10-h.p. engine.

LAY Porta Power runs from the rear wheels of your car. Slip it under the car. Hitch on a belt. Start your motor. A boy can do it.

Write to your nearest distributing point for fully illustrated literature. Or send your order with $5.00 and a LAY Porta Power will be sent—balance on delivery.

Price $48.00

Good dealers are making a lot of money selling LAY Porta Power. If you're a live wire, get in touch with us or our nearest distributor for a good territory.

LAY Porta Power Puts your Car to Work

downward at an angle until it meets the first boring. A fire is started at the interception by the use of oil pitch, coals, or by dropping a hot iron attached to a wire into the hole. After the fire is started brush is piled about the stump.

Dynamite on Wet Ground

Dynamite is frequently and successfully used in removing stumps. Small charges are found useful in splitting stumps which can then be burned more readily. Larger charges are used to break the stumps in pieces, so that they may be pulled easily, or sometimes to remove them from the ground entirely. The best time to blast stumps is when the ground is saturated with water, and the electrical method of firing blasts is recommended.

Where a large number of stumps are to be removed it may require the use of a stump puller. There are two general types; those that pull the stump from the side, such as a capstan type, and those that lift the stump vertically out of the ground by the use of a tripole. U. S. DEP. AGRI.

PROTECTING NEWLY PLACED CONCRETE

Many beginners in concrete work make the great mistake of not properly protecting their concrete work after having gone to a great deal of trouble and expense to have the best of materials and have it well mixed and laid.

Freshly placed concrete must be protected from sun and rain until it has well hardened. After it has its preliminary set, the chief thing to watch is to keep it from drying too quickly. This may be done by keeping it well dampened, either by frequent sprinkling with a fine spray, by covering entirely with water as in the case of a sidewalk, or by covering with rags, chaff, sawdust, sand, etc., and

It is usually not advisable for the amateur to undertake concrete work in cold weather; but it can be done if necessary, if the proper precautions are taken to warm the water and other materials, and to protect the finished work properly. This is sometimes done by covering with canvas and keeping some artificial heat going, or by covering lightly with sand after the preliminary setting has taken place, and then putting on a good coating of stable manure.

No paint or other protective coat should be used to protect the concrete from the weather, as none is needed. The application of such a coat to fresh concrete will cause serious injury and probably peeling off of the outer surfaces. If a tar or asphalt is applied to the interior of a silo or water tank to assist in waterproofing, it must not be done until the concrete has thoroughly hardened.

CARE OF CANARY

A bath is required three times a week.

The bird should be fed at a certain hour each morning.

The room should never be overheated.

Place the cage so that no draught of air can strike the bird.

When birds are moulting keep them warm and avoid all draughts night and day.

Give nothing to healthy birds but rape, hemp, canary seed, water, cuttle-fish, bone and gravel paper or sand on the floor of the cage.

If tempted to feed, no harm can be done by giving some summer rape seed, a little hard-boiled egg mixed with some fine biscuit crumbs or some crisp lettuce once or twice a week.

Two Cents a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on. as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word, each insertion. MARITIME FARMER, Sussex N. B.

FOR SALE A few Sheep, both sex of any popular breeds. CEPHAS NUNN Winsloe P. E. I.

FOR SALE:—Ten choice litters of Yorkshire pigs, not registered. Apply to HENRY McINTYRE, Box 525, Campbellton, N. B.

FOR SALE—Pure bred Leicester Sheep, both sexes, all ages.—STEWART BROS., Murray River, P. E. I.

WANTED.—Mother and daughter or two sisters as domestic help and nursemaid. Good home and wages for reliable, cheerful workers. —Mrs. W. G. Stevens, Chatham, N. B.

FOR SALE—Three pure bred Guernsey bulls fit for service, from Record of Performance dams. Also several calves. D. G. MacKAY & SON, Scotsburn, N. S.

SHORTHORNS FOR SALE—Three pure bred Shorthorn Bulls and a few Heifers. Also two male Colts, one 7 months old and the other a 15 mos. old pure bred Clydesdale.—WESLEY G. GRAVES, Aylesford, N. S.

FOR SALE—Registered Berkshire pigs, different ages, either sex. Some extra good young ones. Also registered Jersey bulls from four months to two years old. J. R. SEMPLE & SON, Truro, N. S.

FOR SALE—Large Tolouse Geese and Ganders from first prize stock at Charlottetown Exhibition, 1918. For particulars apply to DAVID REID & SON, Montague R. R. No. 3, P. E. Island.

Feeding the Human Machine

By W. A. Freehoff

With butter sixty cents a pound in many cities, with milk from twelve to sixteen cents a quart, and with cheese at least thirty-five cents a pound, it was but natural that the housewife used as little butter, cheese, and milk as possible. In the place of butter she began to use the various vegetable and animal oleomargarines, the milk order was cut as sharply as possible, and in some instances cancelled entirely, while cheese practically disappeared from her table.

This tendency was accelerated by the early attitude of the food administration. We were told to save fats, and, therefore, not to use butter for cooking, and we were allowed to believe that oleomargarine was the equivalent of butter for all purposes. The bakers were ordered not to use milk. Mr. Hoover did, however, urge the free use of dairy products for children, but did not explain why.

As the farmers themselves believed that there would be a serious shortage of milk and dairy products, the food administration cannot be altogether blamed for trying to conserve our dairy stocks. It so happened, however, that at this writing, June, there was a great surplus of milk in the country. Not only had the number of dairy cattle increased, but exports were reduced because of lack of ships, and consumption had been reduced because of the effort at economy, and the work of the food administration.

Whenever there is a surplus of any perishable food product, the market is held steady only with the greatest of difficutly. Consequently, the dairy industry is, today, facing the greatest crisis of its history. Feed is high, labor is high and scarce, and the market for milk is not of the best. Thousands of dairy farmers are seriously considering the advisability of going into other lines of farming where the market is steadier, and the chances of profit greater.

The natural inference on the part of the housewife is, why not let him do so? If there is too much milk produced, why wouldn't it be better for some farmers to produce more wheat and other crops, now greatly in demand, and of which there is an actual shortage? Would not everybody be benefited all around?

This sounds reasonable, and ordinarily would settle the difficulty. There happen to be two great reasons, however, why the dairy industry should not only be protected, but fostered. One has to do with the welfare of the people in the cities, and the country also, and the other has to do with the permanent welfare of American agriculture. First, we will touch briefly upon this latter phase.

It is well understood that no farmer can take wheat, or any other crop from his land, year after year, and manitain the productivity of the farm without adding fertilizers. A well-conducted system of dairy farming enables the farmer to maintain the fertility of his holdings, and for this reason the dairy industry should be maintained at a high level in this country. When the American farms begin to wear out, it will not be long before food stuffs of all kinds will rise sharply in price.

The second reason, and the most important one, is the fact that milk and its products supply an element absolutely essential to good health, and nothing else will supply that element. Were the dairy industry to die out in this country, there would be an immediate deterioration of the race.

This may appear a grossly exaggerated statement, but its truth has been recognized by scientists for a number of years. Possibly the greatest authority in the world on this question is Dr. E. V. McCollum of John Hopkins University. Dr. McCollum is at present engaged in an active campaign to arouse the nation to the seriousness of its dairy problem, both from the standpoint of the farmer and the consumer. He tells why milk and all dairy products are so absolutely essential in our daily diet, and he also is trying to arouse the farmers to a realization of their task in preserving this great industry.

Dr. McCollum points out that there are certain diseases peculiar to a faulty diet. Among these are beri beri, scurvy, rickets, pellagra, and even tuberculosis. We in America have not had to cope with many of these diseases, for this has been a land of plenty, with great stores of cereals, meats, and dairy products available, at moderate prices. Accordingly, our diet has been so liberal and so varied that we are well nourish, even if by accident rather than design. In the Orient, however, where meats and dairy products are few, and the people are restricted to a diet of cereals and leaves, not only are the diseases just mentioned a dreadful scourge, but the whole vitality and stamina of the various races have suffered.

We are just beginning to come up against this problem in our own country. In 10 years, 165,000 cases of pellagra have developed. In some of the tenement districts of the large cities, rickets, with all its accompaniment of deformed bones, has overtaken practically 100 percent of the children of these sections. Tuberculosis of a dietery origin is scourging certain cities, notably the black belt of Baltimore. We are coming face to face with the very problem, only in a more minute degree, that has afflicted the Orient for centuries.

Naturally, our congested centers of population are the first to suffer. The people in our slums are wretchedly poor; they cannot afford to buy a liberal variety of foodstuffs; and they have not the necessary culinary knowledge to prepare properly what they do buy. But as this war is progressing, there seems to be an increasing tendency, on the patr of the middle classes, to economize at the table, not wisely, but too well.

So long as this economizing takes the form of eating less, the health of the nation will improve, for we have undoubtedly been too liberally fed for our own good, especially with meats. We have been wasteful, and thrown large portions into the garbage can.

But a very distinct effort has been made in every large city to keep down the price of milk, butter, and cheese. Very little murmuring was done when other items of food advanced in price, but as soon as milk went beyond 10 cents a quart, the daily press began a clamor, which was taken up by housewives leagues and other agencies. The farmer was pilloried as a robber, who wished to take an unfair advantage of the war to boost his profits.

Now, all men familiar with dairy farming know that it takes a heavier investment, longer working hours, presents a graver labor problem, and is operated at a lower margin of profit than cash-crop farming. The only reason farmers have been able to stay in the dairy business, at all, is due to the fact that they were able to raise hay, corn, and other feed at less than market price. But the cost of producing this feed has gone up more rapidly than the price of milk, and the dairy farmer of this country is becoming very much discouraged. When a misinformed public accuses him of being a profiteer, he is so disgusted that he doesn't care whether he stays in the business or not.

But aside from the effect this unintelligent treatment of the milk situation has upon the dairy industry, it has an equally serious effect upon the health of the cities. It has been conclusively proved by Dr. McCollum and his colleagues, that there are two elements which must be present in the food we eat in order that we may be correctly nourished. The presence of these elements cannot be determined by chemical analysis, for animals have been fed on rations that were chemically balanced, and were exactly alike, as far as analysis was concerned, and yet slowly starved to death.

The story of how these unknown elements were discovered is a long one, and out of place in this article. But by a series of feeding experiments, extending over a period of many years, it was discovered that livestock of all kinds, and laboratory animals, like guinea pigs and the domestic white rat, would do well on certain feeds, and die on others that analyzed alike. By a series of careful eliminations, it was finally determined that there were, at least, two elements that were essential to growth and normal health.

Dr. McCollum prefers to give these elements no name at all, until more is known aout them. He does this because the names in chemistry are always given in such a manner that the name tells something about the property of the object named, and not enough is known about the physical property of vitamines to give them an accurate name. Therefore Dr. McCollum calls them merely fat-soluble A and water-soluble B.

Fat-soluble A is so called because it is found almost exclusively in whole milk, cheese, butter, and cream, and to a lesser extent in the yolk of eggs, and in liver fat and in kidney fat. About the only way we get fat-soluble A in our diet is by the use of milk and dairy products, as it is not found in any vegetable fat, with one or two rare exceptions. The absence of this unknown substance will not make so much difference with the adult, but it is absolutely essential for the well being of the growing child. Thus those parents who, by reasons of economy, or because they have allowed themselves to boycott milk and butter, reduce the amount of milk given to their children, and replace butter with one of the many brands of vegetable or animal oleomargarines, are in grave danger of doing their children irreparable physical harm. Rickets, sore eyes, impaired eye sight, and stunted growth are only a few of the possible effects.

Even skim milk will not supply this fat-soluble A, as has been proved by the experience of Denmark. Because of the high price of butter fat, many of the dairymen of Denmark were tempted to substitute skim milk for whole milk. Very soon the children receiving this skim milk had serious eye trouble: the eyelids became swollen, there was more or less hemorrhagg around the eyes, and blindness gradually set in. As soon as these children were put on a whole milk diet, this eye trouble quickly disappeared.

Originally, of course, this fat-soluble A is found in the leaves of plants. It is not practical, however, for a human being to eat enough leaves and similar "roughage," because his stomach and digestive tract is not fitted to handle such a bulky diet. The cow, however, which lives very largely upon the leaves of plants, has a digestive system capable of assimilating vast quantities of rough feeds. Now, as this fat-soluble A has the peculiar property of dissolving in butter fat, it becomes at once apparent how important a part the dairy industry plays in keeping up the health of the nation.

In other words, milk and its by-products, is the first great "protective" food we have. The word protective is used to indicate that the deficiencies found in lean meat, cereals, tubers, and roots, all articles of universal diet, are connected. Milk is the greatest of all protective foods.

The second great class of protective foods is the leaves of plants, and in them is found water-soluble B. This class is of vital importance, but to a lesser degree than fat-soluble A. The human system obtains its water-solu-

(Continued on page 188)

New Brunswick's New Secretary for Agriculture

In the last issue of the Maritime Farmer, we chronicled the resignation of Mr. W. R. Reek, Secretary of Agriculture for the province of New Brunswick. In this issue we are pleased to introduce his successor to our readers.

The Minister of Agriculture, Hon. J. F. Tweeddale, has appointed E. P. Bradt, B.S.A., of Morrisburg, Ontario, to conduct the policies of his department.

Mr. Bradt comes to the Department with a reputation for achievement and we bespeak for him the hearty co-operation of the farmers of the province. To succeed in rounding out the policies of the Department of Agriculture in all its important branches co-operation between the farmers and the Department maintained for their benefit is essential. Mr. Tweeddale has been untiring in his efforts since he took over the important portfolio of Agriculture. Good results have been accomplished and in Mr. Bradt we believe he has secured the services of one, who, if his past reputation as a worker is any criterion, will materially help to carry on the work so well begun.

Mr. Bradt comes to the province of New Brunswick at a time when the eyes of the outside world are turned to note the rapid progress that is being made and he will have every opportunity to continue to make good.

Mr. Bradt was born on a farm near Cayuga, Ontario, in 1885. After completing the courses of education in the public and High Schools of that place in 1903, he engaged in farming until he entered the Ontario Agricultural College, Guelph in 1908, from which institution he graduated and also from Toronto with the degree of B. S. A. in 1912.

Left—E. P. Bradt, New Brunswick's newly appointed Secretary for Agriculture. The other young men are his 1917 champion stock judging team.

During the years 1906-08 he had charge of the home farm. While an undergraduate he was for one year Assistant Agricultural Representative for Lanark County.

He received his appointment as Agricultural Representative, under the Ontario Department of Agriculture, for Dundas County in June, 1912, which position he has held up to the time of his acceptance of the call to New Brunswick. He has at the same time held the position of Secretary to the Dundas Board of Agriculture and Secretary-manager of the St. Lawrence Valley Fruit Grower's Association.

A summary of the work accomplished in Dundas County during Mr. Bradt's term of office besides the regular Agricultural Representative work as gleaned from reports of the Ontario Department of Agriculture, include:—

The organization of ten Farmers' Co-operative Associations.

The organization of the Dundas-Greenville Ayrshire Club and the Dundas District Holstein Club.

The organization of four Junior Farmers Improvement Associations.

The organization of one hundred schools with 1400 children in Rural School Fair and Home Garden movements.

The organization of three Horticultural Societies and the organization of six egg circles.

In the photo which appears in this issue Mr. Bradt is shown with the Dundas County trio of young men who carried off the coveted championship for 1917 as stock judging team in Ontario.

Mr. Bradt instructed these young men and their success is to a great extent due to his thorough coaching. Mr. Bradt is a young man's man, and as such will find ample room for development in the province with which he has cast his lot.

Milk, Its Composition, Care and Food Value

By Frank Herns, Chief Dairy Instructor for Western Ontario, at the Recent Women's Institute Convention, Fredericton

Madam President:—

It is indeed a pleasure for me to come to New Brunswick. I wish to thank Miss McCain and Prof. Reek for their very kind invitation to address you and to give me the opportunity of wishing the Women's Institute in this Province every success.

When I decided to accept this invitation I fully realized from past experience that there is no more critical audience before which a "mere man" can appear than one made up of the members of the same Women's Institute. You have had so many opportunities of listening to prominent speakers of both sexes that I am sure you will give me, "A practical man" your sympathy in my humble efforts to bring before you a few facts about "milk". I shall endeavor to eliminate so far as possible the use of scientific terms and to avoid complicated references. The study of milk carries us far into realms of science, especially chemistry and bacteriology and it would be impossible contract to deal fully with the milk question in one talk. It would require many hours of labor to cover this subject or to give a faint idea of the tremendous amount of research work that has been done, the scientific knowledge that has been acquired by the hundreds of men and women who have devoted most of their lives to prying into the hidden secrets of the apparently common fluid which we call milk.

Even after years of research by some of the best scientific minds of the world, there are yet a great many things not yet known about milk and itis only within the past fifteen or twenty years that many of the real facts concerning the importance of milk and milk products as a food have been learned. Truly it has been said that the Dairy cow is the "Foster Mother of the race" and a "National asset."

Milk

If milk producers and consumers have some knowledge of the composition of milk and of the chief causes for the changes which milk undergoes after it is drawn from the cow, the producers should be in a better position to more intelligently produce pure milk for the factory or for household purposes and the consumers should know better how to take proper care of the milk after it is delivered to the home.

Composition

Milk varies in composition and is a very complex material. It is composed of a number of solid substances dissolved or suspended in water and has a specific gravity (water 1) of 1.029 to 1.034.

100 lbs. of normal milk contains about 87 pounds of water. If this water is evaporated the remainder will consist of about 13 lbs. of total solids which are chiefly made up of:—

1st. Fat—about 3 to 3.6 lbs. contained in 100 lbs. of milk but varies considerably. Chemical research has shown that milk fat is made up of several different fats, chief of which are, Palmitin and Stearin (hard fats) Olein and Butyrin (soft fats). In the spring time when cows are fed on soft foods and it is early in the period of lactation, there is a greater proportion of the soft fats, such as Olein, present in the milk fat and therefore cream is churned more easily and quickly than in the fall and winter when the cows are getting a large quantity of hard foods and are in a later period of lactation which causes the milk fat to contain a greater proportion o fthe hard fats, such as Stearin. The butter made from the milk of some cows is hard and firm while from other cows, even upon the same food, it is naturally soft no doubt due to the different proportion in which the various fats are present. It is the decomposition of the fat Butyrin, which although present in a small quantity, causes butter to turn rancid.

Fat is present in milk in the form of little tiny "dots" or globules, several millions in a drop of milk. The globules of fat are so small they cannot be seen with the naked eye, and when the milk stands for some time the fat rises in the form of cream, the fat makes up the lightest portion of the milk and after the milk is at rest the natural law of gravity forces it to the top. The same result when milk is put through a cream separator. The fat being the lighter portion of the milk, is forced to the centre and is discharged through the cream screw outlet and the skim milk through the skim milk tube. Cream then, consists of many millions of tiny, little fat globules in drops in a portion of the milk Serum or skimmed milk.

Churning is simply a matter of concussion. When the cream is sufficient

Legislation Affecting Dairy Farmers Planned for Near Future

Subjects of far-reaching importance o the dairymen of Canada, which may e followed by rather drastic legislaion were discussed at the Dominion Dairy Conference, held in Ottawa reently, which was attended by repreentatives from all parts of Canada f the various associations affected. The conference was called by Hon. . A. Crerar, Minister of Agriculture, ut owing to his absence the delegates ere welcomed by Dr. J. H. Grisdale, cting Deputy Minister of Agriculture, ho alluded to the part dairying must lay in assisting Canada to wipe off er national debt.

The work of the conference will be ound embodied in a series of resoluions which appear in another column nd ended in the formation of a Naional Dairy Conference, composed of wo representatives from each provnce to be a producer of milk, with ower to add to their numbers as fol-ows:

Four representatives of the cheese ndustry, three from the east and one rom the west.

Three representatives of the butter ndustry, two from the east and one rom the west.

Three representatives of the milk istributors, two from the east and ne from the west.

Three representatives of the cream nd milk producers for city trade, two rom the east and one from the west.

Two representatives of the ice ream manufacturers, one from the ast and one from the west.

One representative of the condenaries.

And that these thirty-four repreentatives elect from among themelves a president and four members f the executive to form an eastern xecutive and a vice-president and hree members of the executive to orm a western executive.

The eastern executive will deal with natters which are of interest to the astern district only, and the western xecutive will deal with matters which oncern only the western district. When matters of mutual interest are o be considered both the eastern exutive and the western excutive will eet at the same time and communiate by wire.

The following were named by the elegates to the Dominion Dairy Conerence as representative of the reective provinces on the National airy Council: British Columbia, E. . Clark, S. H. Shannon; Alberta, E. . Love, P. Pallesen; Saskatchewan, . W. Anderson, A. H .Salmon; Manitoba, W. J. Cummings, Alex. McKay; uebec, Jas. Winter, J. B. Vincent; ew Brunswick, P. Simmons, W. H. uggard; Nova Scotia, H. Faulconer, W. Murray; Prince Edward Island, A. Jones, J. T. Profitt.

Representatives of the various branes of the dairy industry were apinted as follows: Cheese, J. P. Cox, ue.; T. Boyes, Ont.; W. Olmstead, lt.; W. W. Prevey, Alberta. Butter, Pare, Que.; W. G. Medd, Ont.; W. Wilson, Sask. Milk distributors, J. Joubert, Que.; J. Bingham, Ont.; M. Carruthers, Manitoba. Milk and eam producers, A. P. Hillhouse, ue.; R. G. Leget,t Ont.; J. A. Berry. itish Columbia. Ice cream, J. W. rlyle, Alberta; W. J. Foaster, Ont. ndenseries' representatives yet to named.

The council elected the following ofers: President, E. H. Stonehouse, eston, Ont.; Vice-President, A. Mcy, Winnipeg. Eastern executive: E. Stonehouse, F. Boyes, J. Pare, J. ham, J. Walker Jones. Western ecutive, A. McKay, P. Pallesen, J. Berry, O. W. Anderson.

The appointment of a secretary was t to the executive, Mr. Geo. A. Putn acting pro tem.

The discussion as to the proper thod of paying for milk which was oned by a resolution moved by W. F. Stephen, Huntingdon, Que., secretary Canadian Ayrshire Breeders' Association, was largely a one-sided affair, the delegates freely expressing opinion favorable to the producer being paid for milk for all purposes of manufacture and human consumption on the basis of its butter fat content. Mr. T. A. Thomson, secretary Eastern Ontario Dairymen's Association, was the only delegate who opposed the resolu tion. He did not bring forward an amendment, but stated that though he was in favor of the principle expressed in the resolution, he failed to see how any method could be devised to attain the end sought. The resolution was seconded by B. A. Bull, secretary Jersey Cattle Breeders' Association, and was carried by acclamation.

In view of the great increasing demand for dairy products and the fact that the industry is badly crippled for want of suitable labor it was moved by W. F. Stephen and seconded by Mr. Jas. Winter, Armstown, Que., that the conference memoralize the Government to release at the earliest date possible all soldiers in any way connected with the dairy industry. It was conceded that the question of labor was desperate in the extreme; it was a condition that dairymen had been up against in pre-war days and war conditions had made it exceedingly more acute. The discussion brought out the question of cost of milk production, it being as necessary to arrive at some basis as regards cost and a remunerative selling price as it is in the case of wheat, which has been given the attention of the Government. The enforcing of better sanitation, better buildings, etc., more expensive items in the programme of house cleaning considered necessary on the average dairy farm, and the lack of available labor was a large factor in delaying such work, were some of the arguments advanced by the delegates.

A resolution relative to the action of bacteria under modern conditions of creamery butter-making was moved by Prof. Dean, O.A.C., Guelph. The resolution, which was carried, recommended the pasteurizing of cream at a minimum temperature of 150 degrees, but the finding of the meeting was that this was too low a temperature. It was perhaps difficult, it was argued, to meet the requirements of local and short time trade but for export and long time keeping it was insufficient. For the local trade, usually immediate consumption, such a high temperature is not necessary, but as it is difficult to know how long the local trade some times keeps the butter on hand or in what market either local or export, it ultimately finds its way, the higher temperature is essential. The final test in asking the butter itself, which was the safe temperature to adopt in pasteurizing is got by the Storch test, which was fully explained in a demonstration given by Mr. C. Marker, Dairy Commissioner, Calgary. It is used by the trade in order to test butter as to its keeping qualities.

Among the most interesting and practical topics was the "Compulsory Pasteurization of Dairy By Products," introduced by Dr. Torrance, Veterinary Director General, Ottawa, relative to the alarming sperad of tuberculosis in hogs. The three methods by which tuberculosis in pigs is spread is first by drinking the milk of tubercular cows, secondly by pigs getting unpasteurized whey or milk from a creamery and third by following cattle in a yard. It is not generally understood that the manure heap will carry tuberculosis to pigs from cattle so affected. He condemned the practice of giving pigs the chance to eat the carcasses of cattle that died from whatever cause. It was also largely spread through garbage feeding which practice also gave rise to hog cholera. Some municipalities enforce the cooking of all garbage fed to swine. But the main source was the milk from the tubercular cow. In the abattoir killed pigs, to the number of 2,129,682, it was found that 19 per cent. were diseased at an annual loss of $255,561, and counting those killed in uninspected slaughtering such as at farms and local slaughtering places, the loss would be double that figure or an estimated loss of half a million dollars.

From statistics of the pig industry in Ontario the hog tuberculosis runs from 4 to 6 per cent. and tuberculosis is most rampant in the counties that are given up to dairying.

The best method in freeing the country of tuberculosis was first to get rid of it in cattle, but as this must necessarily be a huge as well as a slow undertaking, the next best way was to pasteurize all by products, on farm and at creamery given or sold as pig feed.

"Market investigations" was a subject of exceptional interest, and the resolution moved by K. G. MacKay, and seconded by E. T. Love, recommended that the conference of Dominion dairymen appoint a commission to investigate the requirement of the export market. It was recognized that the only market today worth any thought was that of the United Kingdom, and no matter what the tastes, or prejudices, or practices in handling or making butter in Canada the tastes of the export market must be realized and consistently catered to. From authentic reports it is clearly gathered that there is not enough imported cheese or butter in Britain to hitherto meet the demand that country. All qualities and varieties of butter are to be found on the Canadian market, some heavily salted, as is done in the United States; some less so, and many are of a nondescript character. The variety in demand in the United Kingdom is of a sweet, creamy flavor, with very little salt, and this condition will have to be studied by butter makers before the large surplus expected in Canada can be freely sold in this export market. The resolution was carried unanimously, and special emphasis was placed upon the advisability of having no delay in the investigations and issuing report.

The resolution re the "Improvement of Dairy Herds" brought out the basic facts underlying the economic production of milk. It was generally admitted, in the discussion, that the most important factor in building up a dairy herd was by the medium of a properly bred prepotent sire. Two regrettable features admitted to be followed by large numbers of dairy farmers were the using of pure bred sires without obtaining any reliable information regarding the milk producing qualities of the dams of the sire; and that too many dairymen apparently did not realize the importance of the value of knowing something about the milk producing qualities of the sire's ancestors. It was also pointed out, as one of the greatest needs at the present time and the greatest problem confronting the dairymen of Canada today is how to eliminate the unprofit-

(Continued on page 187)

Resolutions Adopted at Dominion Dairy Conference

At the Dominion Dairy Conference, held in Ottawa recently, the following resolutions were adopted:

"Resolved, that this conference place itself on record as favorable to the producers being paid for milk for all purposes of manufacture and for human consumption on the basis of its butter fat content, and that the various Provincial Governments be requested to enact such legislation at as early a date as will bring such payment of milk into effect."

"That the by-products of cheese factories and creameries should be rendered harmless by pasteurization or sterilization before removal from such factories for feeding purposes, and that the Dominion Government be requested to make it compulsory to pasteurize or sterilize all dairy by-products."

"That, in taking milk samples, the samples to be tested be divided into three equal portions, each properly sealed, one to be handed to the vendor, one to be tested by the municipality and the third to be held for testing by an independent authority, should occasion require it."

"That the Government be memoralized to release at the earliest possible moment all soldiers in any way connected with the dairy industry, which includes producers, cheese and butter makers, milk distributors and others."

"That the order permitting the manufacture and sale in Canada of oleomargarine be rescinded, and its manufacture and sale in Canada be declared illegal after six months from the date of the declaration of peace; further, that the National Dairy Council be consulted before any legislation be enacted affecting the dairy industry."

"That the Dominion Government be asked to appoint a commission composed of butter experts to investigate the requirements of the various export markets, and report their findings and recommendations at the earliest possible date."

"That the system known as pasteurization of milk or cream in the manufacture of all butter made in Canada be recommended and adopted at once by all creameries which are not already using this method, the standard temperature recommnded to be 170 degrees F., holding for twenty to thirty minutes, or 176 degrees F., by the flash method."

"That owing to lack of uniformity in the scoring of butter and cheese throughout Canada, that a uniform score card and certificate with a new scale of points for scoring both cheese and butter be used."

"That to support the National Dairy Council each delegate pledge his association for a grant of $100; that $10 of this amount be paid at once and the balance on or before February 1st."

"That the National Dairy Council make a request to the Dominion Government for a grant of $5,000 to assist in the work of organization, and that this amount be available within sixty days."

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

DECEMBER 17, 1918.

NEIGHBORS GETTING TOGETHER

This in essence is the soul of the movement for community betterment in the country and from it radiates larger practical benefits to the individual, better farm living conditions, and a better manhood and womanhood. When conceived on the basis of an "uplift", efforts to accomplish these ends will never succeed; but in Massachusetts they have not sought to organize rural communities by a prearranged plan, but they have gone out to learn from the people themselves and then to aid them in their self improvement by their own community. After several years of experience in being taught, the Massachusetts College of Agriculture deems the time right for publishing the results of its work along these lines and offering a plan of operation. This it has done in a bulletin entitled, "Mobilizing the Rural Community", by E. L. Morgan.

"It ought to be stated just as strongly as possible," says President Butterfield in his introduction to this bulletin, "that this work is not in the nature of an 'up-lift'. It is not even 'social' in the narrower sense. It is somply a method of organization by which we seek to assist the town to bring into co-operation all the agencies, individuals, and institutions in the community, in order to get the full measure of capacity of the town at work developing the community, industrially, socially, and in every other way. The work has fully as much to do with the so-called 'practical' or business phases of agricultural development as it has with any other. Indeed, its principal achievements are in the practical field. We believed from the beginning that the local community should be built up to its fullest possibilities; that it should study itself, make its own plans for its highest development, gain the co-operation of all its people to carry out this plan. This sort of organized effort we believe is the key to rural progress everywhere."

With this sort of an introduction one can read on with assurance that he will not meet with the maudlin sentimentalist who would go out into the poor, ignorant country to "uplift" it out of its sloth and degradation. A movement conceived and promoted as an unlift, even when the idea itself may have value, is at once condemned as futile by every person well informed concerning farmers and agriculture. The farmer is rightfully suspicious of the self-appointed, smug custodian of his welfare, and his independence holds in righteous contempt this kind of mendicant charity.

The bulletin fulfills its introduction, and its scope is further explained in the further quotation from President Butterfield's introduction as follows:

"The 'community idea' is not a new conception. This bulletin is simply the story of the facts and an outline of the principles and advice that have grown out of the experience of nine years of study and effort in applying the idea to the rural towns of the state. This effort has been, however, not merely an experiment. It has been also a demonstration, because it has been a real success. We believe that not only is the main idea sound, but that the methods suggested are sound. Of course, these must be adapted to various communities. No two communities can work exactly in the same way."

What we particularly enjoy in this bulletin is that the author keeps his feet on the ground, and does not soar off into the misty heights and clouds beyond he ken of his reader. The plan has succeeded in Massachusetts, which is its best recommendation.

BRED BY EXHIBITOR

One of our most prominent Shorthorn Breeders who bred, showed and sold good stock, used to head his advertisement in the columns of The Maritime Farmer, "We breed our Winners and Sell them too". His motto may well be emulated.

The Breeder's Gazette has a splendid editorial on "Bred by Exhibitor", and we fully endorse it in the main. Its logic is sound and unanswerable. It is all inclusive and most comprehensive. The idea to offer 25 per cent extra for every animal bred by the exhibitor is unique and excellent. The Gazette might have mentioned one element in the show business that is more or less of a nuisance and sometimes a real hindrance to local progress. There always has been at least a moral protest against the business of the "dealer in live stock exhibits". (We do not mean the legitimate importer who buys to exhibit, breed or sell, or do all three, as each is honorable.) We mean the "professional show man" who picks up from the importer or buys at large and goes the rounds with half a dozen different breeds. This unwelcome guest not only produces nothing but really stands in the way of the hard-working, ambitious breeder and exhibitor. Of course, there is a sort of legitimate selfishness in the whole exhibition business. There must be competition, however, to draw out the best in breeding and exhibition of all animals, and we must put up with some unhappy features of the business.

We are republishing the article in question from the columns of the Gazette, and recommend it to the consideration of all our Fair boards.

BUY A BULL

No dairy farmer should hesitate now to purchase a pure-bred dairy bull. Improved blood has always been a splendid investment, but the world's shortage of dairy products and the increasing demand for good dairy cows makes the investment more inviting than ever. Hoover informs us there is a world shortage of fats and milk. The shortage of fats amounts to three billion pounds and it would require 1,500,000 cows, with a production of 200 lbs. of fat per cow a year, to produce that amount of fat.

improved cows, cows capable of producing 250 to 300 lbs. of fat in a year, will be in larger demand in the future than they ever have been in the past. Cow testing associations are increasing rapidly and these organizations are revealing to the farmer the fallacy of keeping poor cows. The farmer who is raising high grade cows will find a ready market for them and at good prices. Good grades now are selling for $150 to $225 apiece. Further, the grade herd is returning a larger profit at the pail. A farmer who has not purchased a pure-bred bull to head his herd is losing money and will never be in position to take advantage of a grade cow market. Nondescript cows will not sell within $50 to $100 of as much as the grade.

For an absolute sure investment and a large rate of interest, nothing can beat a pure-bred dairy bull.

IDLE MACHINERY IS EXPENSIVE

With the labor problem the most acute in the history of farming, the farmer must depend upon machinery to supplement the labor he will find unavailable. The Government is taking steps to insure that there will be no delay in delivering the thousands of cars of new implements needed during the war period and thereafter. In this connection here are a few pointers which the farmer woud do well to keep in mind.

"Machines make money for you when they are in use; they cost you money when they stand idle.

"A machine makes the greatest possible profit for its owner when it is used continuously in profitable work till it is worn out. Then it is really worn out—it does not rot or rust out.

"The average farm implement is only about half worn out by use alone. The rest of the wear is due to rust and decay.

"Acres count in the life of a machine—not years."

HUB OF THE FARM

The barn and outbuildings are the farm factories—the hub of the farm around which all its activities centre. They should be centrally located, and easily accessible from all part sof the farm, and so arranged with relation to one another and to the dwelling that the oft-repeated chore can be done with the fewest steps and the least time. Good, natural drainage for the building site is, of course, highly desirable. If that cannot be had, tile must be resorted to, though they do not always give the desired result because the ground in the barnyard becomes puddled by the tramping of the stock and the water does not really drain off.

ATTENTION ST. JOHN HOUSEWIVES' LEAGUE

On another page of this issue will be found an article entitled "Feeding the Human Machine", which we are republishing from the columns of one or our Amrican Exchanges.

The article in question deals with a subject that is of vital importance to the consuming public in our towns and cities. It is passed along with the hope that it may be read by the members of the Housewives' League, St. John, who have developed such antagonism to the milk producers, who supply the lactic fluid to the city of St. John in general, and particularly to those of the latter class who are fortunate enough to be residents of the good old County of Kings—the Denmark of New Brunswick.

* * *

Stumps occupy valuable land; foster the growth of weeds, since in order to keep the land in their vicinity clean much hard labor is necessary; mar the appearance of otherwise smooth fields, and hence reduce the selling price of a farm; furnish shelter for harmful insects and animals; and prevent the efficient use of modern machinery.

"BRED BY EXHIBITOR"

Inseparably joined with the necessity which confronts fair managers of greater liberality on the financial side of their prize lists is the question of extending larger recognition to the breeders of winning animals. Closed classes defeat the prime objective of an exhibit of seed stock breeding animals. Any artificial barrier which prevents in any way the presentation of animals of the highest excellence, of whatever origin of birth or fashion of conditioning, will inevitably lower the standard of arenas in which the essential object is to demonstrate the highest type that genius can breed or money can buy. It has been many a year since the state fair closed its classes to the outside world, and the sadly erroneous idea is not apt to have the breath of life breathed into it again. Additional rings of state-limited specials are yet occasionally found in prizelists, given under the erroneous impression that breeders can lift themselves over the fence by their own boot-straps, but the general intelligence of showyard management has come to apprehend the fact that the prime object of a stock show is educational, and not the distribution of prize money among breeders of any one geographical or political division. These shows reach their highest degree of efficiency only as they set standards that approximate the supreme ideals of breeders. Only by measurement with such standards can a breeder accurately estimate his own animals and elevate the plane of his production. Merely to beat his neighbor in a restricted county or state competition tends to give a breeder an entirely false idea of the merit of his own animals and hence retards his proress toward success.

For this reason the supreme contributions from breeding herds on any continent are welcomed at our shows, and the most skillful conditioning meets with its reward. Fitting can be and is sometimes carried to an extreme that is reactionary, and this condition is found alike in cattle, both beef and dairy, and in sheep, swine and horses. The fitting of show stock is not the job of a novice, and rare talent is required to tell just when the finishing touch has been applied. When it has been bestowed by master hand on animals home-bred or imported from the foreign nurseries of breeding stocks, our shows reach the maximum of their usefulness.

Men of means have from time out of mind been drawn to the breeding of pedigree stock, and have made liberal expenditures for the satisfaction of demonstrating in the showring the superiority of their stock. Against them the ordinary breeder has found it difficult to show, as unlimited means have picked and chosen here and there the tops of herds on both sides of the water, and exhibition animals of rare strength have in this way been assembled. But every one of these men who lavishly invest in superior show stocks and who find full satisfaction in the prizewinners of their animals, is yet more profoundly pleased when animals of his own breeding finally come on to win. Rarely do they fail to sense in full the joy of constructive creation. Men of this stamp have been foremost in holding aloft the highest standards in our showyards and thus encouraging others to shoot at the mark. And others have shot successfully, as showyard history is full of the triumphs of breeders who have met successfully the importations and purchases of rich men with high ambition to win.

It seems wholly reasonable that the genius of the breeder who thus rises to notable heights in his operations should be rewarded. It is a common saying that any one with money can buy show animals, but that few can breed them. It is not an accurate statement, as it requires seasoned judgment as well as an open purse to select winners in the fierce competition of these latter days. But it is undeniably harder to breed a champion than to buy one, and the reward of production should bear some relation to the genius and effort involved. The tendency is marked to offer specials in recognition of the breeder, but danger lies in that direction. Our classifications are already about as complete as is practicable, and further additions complicate the situation. Usually the young herd competition is limited to animals bred by the exhibitor, and is generally the only restricted class. It is readily possible to offer adequate recognition of the genius of the breeder without increasing the number of classes or special competitions. It may easily be done by adding a certain percentage of the regular prizemoney in case the winning animal has been bred by its exhibitor. In view of the hot competition which breeders have faced from imported and home-bred animals, selected with the special view to exhibition, it would be quite in keeping with the merits of the case if 25 percent were added to the regular cash prize for every animal that is bred by the exhibitor. The glory of winning with an animal bred by the exhibitor is well enough, and is not without its tangible returns, but in view of the almost unlimited expenditures made in pursuit of prizewinners, a substantial and superior financial reward should be reaped by the breeder who sends a winner into the arena. Such a plan would not in any way interfere with the purchase of show stock by those who select the short-cut to arena renown. It would not tend to lower the standard of our shows, but on the contrary would hold out substantial encouragement to the breeder to invest in high-quality stock with a view to winning the most coveted of all prizes, "bred by exhibitor."—Breeder's Gazette.

FERTILIZING THE ORCHARD

There has been considerable discussion as to the plant food requirements of fruit trees, and experiments would indicate a wide variation in the results obtained from the application of various commercial fertilizers. The amount of plant food actually required by an orchard must, because of the natural variation in soils, necessarily vary. Former soil treatment is also a big factor and it is exceedingly difficult in reading results to determine just how far previous management and natural favorable soil condrtions have influenced the results.

The check plots should enable one to determine the effect of the fertilizers applied fairly well, but the tendency is to leave too few check plots, for as all soils show much variation within even limited areas, local environment may happen to be favorable to the check, and the check plots should b echecked up by other check plots. The wide variation of individual trees in an orchard is well illustrated if one keeps a record of the trees in an orchard for a few years, some trees producing annually abundantly and others failing to give reasonable crops, all managed in the same way.

This variation must be due to some environmental condition and may be the result of some treatment many years previous. There may have been many contributing factors, and it would be impossible to trace out and find the real cause. It is wise, therefore, to use larger areas for fertilizer tests and conduct a smaller number of experiments. This represents more expense and involves much more work but would lead to more definite results.

All experiments would seem to indicate that of all plant food constituents required by the tree, nitrogen is of first importance. A lack of nitrogen leads to unthrifty growth and lessens the capacity of the tree to produce profitable crops. An unthrifty growth may force the tree to fruifulness, but unless the tree can at the same time maintain its vegative development, the crop produced may each year become of lower grade and less profitable. This is well illustrated by a girdled tree which is an extreme case as all vegtative growth has ceased and fruit only is produced. The checking of the vegetative growth in a tree may, while tending to bring about fruitfulness, lessen ultimate production. On the other hand an excessive use of nitrogen may result in too much vegattive growth which may tend to lessened fruitfulness, or delay ripening of the wood running the risk of winted injury. The normal vegetative growth of apple trees is made during May, June and July, and all fertilization and cultivation should be given with the idea of encouraging vegetative growth at this time. Unfavorable conditions later may not seriously affect the tree, in fact may tend toward a better ripening of the wood and the development of fruit buds, as anything that tends to check vegattive vigor naturally forces the tree toward reproduction.

In orchard fertilization, therefore, the aim should be to start off the tree with a strong, active growth, and to do this a plentiful supply of nitrogen early in the season is required. Results would show that all nitrogenous fertilizers should be applied so that the tree can get it at the start of growth and during the blossoming period, for at that time the heaviest drain is being made on the vitality of the tree, and the available soil nitrogen supply is at its lowest. It can therefore be stated with assurance that quickly available nitrogenous fertilizers such as nitrate of soda should be applied during the period from the 15th to the last of May. It would seem also that no form of nitrogen can take the place of nitrate of soda giving an annual application at the rate of 150 pounds per acre of area actually occupied by the tree. One half ounce per square yard is approximately 150 pounds per acre. This may be increased to 200 pounds if the trees are greatly lacking in vegetatiive vigor. Nitrogen in nitrate of soda is available when it comes into contact with soil waters, whereas the nitrogen from decayed vegetable matter in the soil or stable manures may not be available nutil broken down by decay which is slow in the spring of the year. Soil nitrates particularly in leachy soils, or soils deficient in humus are likely to be pretty well washed out of the land and the trees suffer from not having this necessary element, hence the importance of applying a readily available nitrogeous fertilizer. Stable manure should be applied early and worked into the soil and annual light applications will be found more beneficial than periodical heavy applications. The orchard as a whole should produce reasonably uniform crops from year to year and for that reason uniform annual application should be given. One ton of well preserved stable manure contains about 10 lbs. of nitrogen, and the average manure would contain from 5 to 8 lbs. Three tons of manure would therefore give appriximately the same amount of nitrogen as 150 pounds of nitrate of soda, but as above stated the nitrogen in the stable manure would not be available until complete decay had taken place, and annual application of six tons stable manure, approximately three pounds per square yard, applied just as early as possible and worked into the soil will give the necessary nitrogen and furnish the trees with all the plant food they will require for the season.

Menton has been made of the possible loss of nitrogen from leaching as a result of heavy fall and spring rains. This brings up to the importance of using cover crops to trap any excessive plant food not taken up by the tree, and it also should interest us because by using a leguminous cover crop much nitrogen may be trapped, and the expense of furnishing so much nitrogenous fertilizers are done away with. Vetch or crimson clover makes an excellent cover crop. Red clover would be the best only that it cannot make the growth in the average season necessary to enable it to enrich the soil much with nitrogen unless planted about the middle of June. If we could do our cultivation early in May and again in June and follow at once with a cover crop of red clover, it is possible that we would get the growth desired. The tendency, however, is to delay the cover crop seeding, giving an opportunity to make a late June cultivation, which may in some seasons be necessary, but on the whole earlier seeding of cover crops, if the early cultivation has been what it should, will be more profitable in the long run.

Phosphorus and potash are two essential elements, and, even if stable manure is used it is advisable to supplement it with a fertilizer carrying phosphorus. Acid phosphate is the principal phosphatic fertilizer, and has the advantage over the other forms in that the phosphorus is more readily available. Annual applications of 500 pounds per acre will be found satisfactory and this may be applied broadcast the last of May. Slag is a good orchard fertilizer. The phosphorus, however, is not so quickly available and unlike the acid phosphate may not give the necessary plant food early. The usual practice is to apply this early at the rate of 600 to 800 pounds per acre. Slag carries considerable free lime, often amounting to 40 per cent., and on some soils this is a very important factor, for they are so deficient in lime that clovers will not do well and a good clover growth is about impossible without it. In case acid phosphate is used, ground limestone at the rate of 2 tons per acre is applied every three yeasr, thus ensuring a vigorous clover cover crop. The animal fertilizers will carry phosporus the bone fertilizers furnishing the largest percentage. This may be used at the rate of 400 pounds per acre to advantage.

We have been forced to get along without potash during the past four years,and while this has not been appreciablymissed, yet it seems reasonable to suppose that available soil potash is running low, and as this is one of the essential elements of plants, and one drawn upon reavily in fruit production, we should see to it that a reasonable amount is supplied. Well kept stable manure with all liquid retained by using plenty of absorbents contain about as much potash as they do of nitrogen, and if it is used the trees will have a reasonable supply of this element. It is estimated that a bearing orchard should have 50 lbs. of potash per year. If a 50% muriate of potash is used, one hundred pounds per acre would be necessary to furnish what is required. Cover crop of clover will assist very greatly in making use of inert soil potash. Clovers draw heavily upon this element, and particularly the red clover, if a vigorous growth has been made, will make use of much subsoil potash that other more sallow feeding plants will not get. Cover crops of clover for this reason alone should be considered essential.

It is exceedingly difficult to treat this subject except in a general way. If stable manure is available, annual applications of six tons per acre as stated above with the addition of 300 to 400 pounds of acid phosphate should supply the wants. If the orchard is unthrifty,annual applications of nitrate of soda 100 to 150 pounds per acre should be given until such time as this may be considered unnecessary, owing to a reserve of available nitrogen being held in the humus. Another feature of cover cropping is that the humus is gradually increased in the soil and greater reserves of available plant food will be carried without leaching.

If ever cover crops are making a vigorous growth and the soil thereby built up in nitrogen, it may be advisable to drop even the manure as too strong a vegetative growth may result.

(Continued on page 188)

HORTICULTURE·

PRUNING THE BEARING TREE

(By C. I. Lewis, Chief Division of Horticulture, Oregon Agricultural College, Corvallis.)

In treating the question of prunoing it is wiser to deal largely with principles and allow each grower to work out his own special application. However, the field of pruning is so large and the time is so short before the pruning season begins that I am going to deal very largely this time with some applications of the general principles of pruning, choosing such applilations as I feel would perhaps reach the larger number of our Western growers, and giving as little atention as possible to the question of principles.

During these war times the problem of cost of labor is uppermost in the minds of most fruit growers. Labor is so high and so scarce that it must be utilized to the best advantage. We must not, however, carry the question of economy to such extremes that it will prevent our producing high-quality fruits, as there seems to be a good market at profitable prices for such fruits.

One of the questions which is very important at this time is, how early can I safely begin my pruning? If the pruning period can be spread over a long time it will mean hiring less labor because the grower can do more of his own work . Under normal conditions the best practice seems to be to wait until the danger of severe freezing is over, which is most apt to occur during December and January. One probably runs a less chance of injury by pruning after that period in those sections subject to freezing winters; however, in most districts of the Pacific Northwest there has been only one winter in the last twelve years, namely that of 1908, when much damage occurred from early pruning. During that winter considerable die back and heart rot was started, due to the fact that the early-cut surfaces were easily damaged by the severe winter, and rots got a foothold in the trees. With the present great scarcity of labor one would probably be justified in beginning as soon as most of the leaves are off the trees. It would be better, however, to confine such pruning to the older, more mature trees and the portions having the better air drainage. We should also remember that it is unwise to prune trees when they are frozen. By beginning early the grower would have late fall, all winter and a portion of the spring up to the time the leaves are breaking through in which to do the pruning.

In pruning our bearing fruit trees, the bud and the fruit spurs are two parts which we should give special study. Some investigations that we have made at this experiment station would indicate that the percentage of spurs that bloom from year to year decreases as such spurs get older, and that the percentage of spurs which bear fruit decreases at an even faster rate as they get older. In other words some spurs may have the vittality to produce a bloom but have not reserve energy enough to set or, after setting, to mature a fruit. Our investigations have shown that the amount of growth that a spur makes for a given season has a close relation to its bearing the following season. There is also a correlation between bearing and length and diameter of spur. Branches that have a large diameter have stronger spurs and bear more fruit. From these results it would seem that the spur to a large ertent acts as a barometer, and that a study of their vitality and the nature ow the wood on which they are borne will determine to a certain degree what pruning should be given such trees. One should attempt to develop a fair amount of new wood annually in order to provide for the necessary increase of new buds and spurs essential to the best tree development and should constantly keep in mind the revitalizing of some of the older spurs on the trees.

General pruning practices will mean either a heading back, a thinning out, or a combination of these two. If one simply desires strong sprouts and a new top, so to speak, then heavy heading back will produce that result, but if one really desires more development of spur and bud in the immediate future, then a moderate heading back would be more desirable, since one would be removing a much smaller number of sprouts, which in turn would require heavy heading back. Likewise heavy thinning out would naturally remove more buds than a moderate or light thinning out. Let us apply this idea of heading and thinning to some of our standard varieties. Ttake the Jonathan and Wagener as typical of varieties which often bear large quantities of fruit from auxiliary buds, which would be found on the one-year-old wood. It is evident that a heavy heading back of such varieties would remove a large percantage of the crop, and this is just what is happening in many an orchard in the Pacific Northwest. The tonnage is being greatly reduced by such pruning. Take these varieties from six to ten years of age for example, and they could go without heading for several years to good advantage, and would bear bushels of fruit to the tree which otherwise would be sacrificed. Of course one can carry the non-heading to the extreme. When heading is done with such varieties, it is often wise to do it soon after the apples have formed, we would say in early June. In this way a good crop of apples can still be saved and new wood develpoed for the next year's crop. The Newtown, however, offers an entirely different problem; severe heading in of this variety does not so much remove fruit buds which are already on the tree, but it has a tendency to force out an excessive number laterals. As a result many of our Newtowns are nothing but brush-heaps, and while they continue in this condition will produce little or no fruit often until they are twelve or fifteen years of age. Reduce the heading to little or nothing for a few years and have the pruning consist more of thinning out, and the trees will begin to bear. In thinning out some of these thick Newtowns, however, two plans can be followed. One is to thin out much of the lighter brushy wood, and the second is totake out bodily a few of the large brancehs which sooner or later should be sacrificed. Generally speaking, I believe that the latter practice would be the more practical, as it stil opens up the tree and does not remove as many fruit buds. Some of these smaller branches of Yellow Newtons are the first branches to bear and the constant thinning out of such wood deprives the trees of a large percentage of their buds and spurs and keeps them constantly producing vegetative growth instead of buds and spurs which produce fruit. The Spitzenberg represents another type. Here we have a tree, the branches of which become long and rangy, producing few laterals, thus having too small a bearing surface. This tree also has weak spurs. A large percentage of the spurs on any Spitzenberg tree becomes devitalized after three years. The Spitzenberg needs much heading in in order to force out the laterals and to constantly bring out new wood which will have plenty of bearing surface. I had the opportunity to inspect some Spitzenbergs forty years of age, and I could see by looking over these trees what was going to happen to a large percentage of our Spitzenbergs unless we change our methods of pruning. The trees largely grow much as does the peach, forcing out long, naked branches on which a few twigs bearing weak spurs are borne. I fear too many growers are prone to leave too many scaffold branches in their Spitzenberg trees. I would try to combine my summer and winter pruning in such a way as to produce shorter, stockier main branches, each bearing more laterals. Various parts of the tree should from time to time be headed in or thinned out so as to renew the spurs or revitalize spurs in that portion of the tree. The Ortley represents another type of tree which naturall ygrows stocky, bearing its fruit and spurs close together on the older wood. Here some heading can be practiced without disturbing the tree, and occasionally where a tree becomes somewhat rangy it is wise to head it in and force out a few laterals which in a course of time will become thickly studded with fruit buds and spurs.

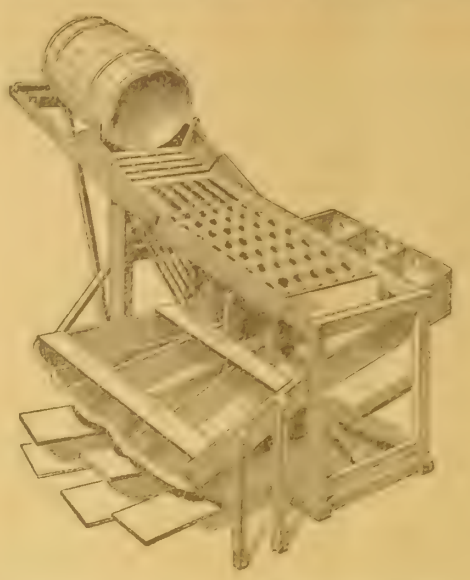
In our pruning we must constantly remember that it is desirable to study each branch of our tree and determine its relation to the whole tree. If some of the main strong branches of the tree are growing at the expense of short or weaker branches that we would like to develop, suppress the strong branches by heading them back ro otherwise reducing their leaf surface; this will encourage the weak wood by giving it a larger percentage of the leaf area, which means more growth. Pruning should be well distributed throughout a tree, as a direct stimulation coming from a cut is found close to the point where a cut is made, and if we want a general simulation of the fruiting system of a tree we have got to make numerous cuts. An example of the above can be nicely ilustrated as fololws: If you have five main branches on a pear tree and head in strongly or dehorn one of these, the result will be that just below the cut long suckers or watersprouts wil develop, but on the uncut branches little or no change will be seen in the suprs. tI is largely by distributing our prunings so as to include the other branches that we can get a revitalizing of their parts.

It would probably be well to say a few words in regard to trees six to ten years of age. I have already indicated such trees are generally overpruned. Thinning rather than heading will bring better results, and this thinning may be done in winter and also to good advantage in early summer. By confining our pruning to summer and winter thinning and a little summer heading occasionally most varieties can be made very productive.

As many growers have pear trees a few words in regard to pears will be acceptable. The pear has a tendency to produce too many spurs. Anjou, Bartlett and Winter Nelis often produce a very large number of spurs on a small quantity of wood. Gradually these spurs become weaker and weaker and often set their fruit very poorly, and we say we have a pollination problem on our hands. Our experience has shown that a thinnh out of such spur clusters seems to r vitalize those which are left on t tree, they begin to make a bett growth, the fruit on the trees becom larger and close to the cuts ne shoots are grown out which will turn form new spurs. This is a go illustration of the statment recent made that the stimulation from a c comes nearest the cut and freque cuts are needed to revitalize the sp system of a tree. This work can oft be done to best tdvantage with ha shears. There seems to be a genera feeling that pear trees should neve be cut very much; that it mabes sappy growth susceptible to bligh and there are many evidences tha there is much truth in the last stat ment. It is very interesting to vis the orchard of Mr. Sawyer of Topper ish, Washington. Mr. Sawyer has on of the largest pear orchards in tha country, is in an irrigated section an has had his orchard in alfalfa sod fo eighteen years. He prunes very hea ily and as a result he gets a goo growth, has little or no propping t do and has a heavy yield. He is in section where blight occurs, but h seemingly has little trouble with thi disease. Mr. Sawyer may be uno th dox, nevertheless his ocrhard is good testimonial of the soundness his views and is worth the seriou consideration of pear growers.

Since there is a great interest the Italian prune, a few words to ou prune growers will be of some aid t them. There are three kinds of woo on the average prune tree. First, th upright strong branching wood o staghorn wood, so to speak. Thi wood has a mighty bright future. Se cond, there is the wood which grow out horizontally. This wood has ha a wonderful past, a fair present bu an unpromising future, and, third, th drooping wood; all it has is a pas In other words, the staghorn wood beginning to bear, and in the nea futur ewill not only produce the mos of the prunes on the tree, but also th largest ones. The horizontal wood while still producing lots of prunes, i setting less and less blossoms and i tending to produce small fruit. Th drooping wood may bloom, but is generally too weak to produce fruit of it does produce, the fruit will found to be of inferior quality. Th problem of the prune then, is to kee plenty of staghorn wood coming in the tree and keep removing the droop ing wood. Such a removal would im mediately revitalize the remainin spurs and buds left on the trees; mor fruit, larger sizes and new, vigorou wood is the result. Much of thi drooping wood can be most cheaply and easily removed by putting on a old pair of gloves and simpyl breaking

The Elderkin Fruit Sizer and Grader



To grade your apples quickly, cheaply and in the best possible manner, you require an ELDERKING GRADER, the best on the market, with help so scarce, why not buy a grader at once and get the biggest price going for your fruit.

out. Where a good, vigorous sprout ppears on a prune tree, remove some the older wood next to it and give he sprout a chance to develop. Badly evitalized trees can be dehorned and ew sprouts developed into fruitful ps in four years, but this should not e done unless necessary, as a vigor- us thinning will often revitalize many ees without the loss of the crop for ree or four years. Most of our stone uits such as the prune and the cher- es are often short lived owing to eart rots which develop. These eart rots fungi get their foothold in ounds. The wounds in not only such ees but in all trees should be care- lly protected. Coper nails could be sed where they are easily procured, riving them into the cut surface, the opper killing out the decaying fungi. his is a practice that is being used parts of Californa. The Bordeaux aste, however, as recommended by he Plant Pathology Department of is institution, is very good and made s follows:

Bluestone Solution.—Dissolve 1½ ounds of bluestone (copper sulphate r blue vitrol) in 1 gallon of water in wooden, earthenware or glass ves- el. This is best done by suspending he chemical in a bag of loosely-woven loth or burlap, at the top of the ater, or by pounding the lumps into mall bits and dissolving by use of hot ater. This solution attacks metals ctively.

Lime Paste.—Slake 3 pounds of uick lime with 1 gallon of water, in he ordinary manner.

Mix in Equal Parts.—When the lime s cool enough, equal parts of the blue- tone solution and lime paste should e mixed together thoroughly. Mix nly enough at one time for a day's se. Apply like whitewash with a rush. The stock bluestone solution nd stock supply of slake lime can be ept indefinitely if not mixed together rovided water is added occasionally o keep solutions up to the original olume.

Apply this paste to all wounds and trive in every way to keep decay rom entering the trees. Many a rune tree which looks all right from he outside has really only a few years eft owing to the fact that the decays ave riddled the wood of trunk and ranch, and in a strong wind, some lay, such a tree will be sacrificed.

THE CABBAGE BED

Cabbage growers can afford to take o chances. New York State is far in dvance in cabbage production of any ther State in the Union, and Cortland ounty is one of the leading sections f the State. The Cortland County arm Bureau is giving some brief cab- age pointers that are valuable to all nterested in the crop, having gleaned he lore from exhaustive tests made n 18 farms of the county by Allen S. Merchant, manager of the Farm Bur- au. These tests all coincide with the xperience and teachings of Reed Brothrs of Cortland, who are recogniz- d as the leading growers of the State. The pointers may be usmmed up brief- y as follows:

1. Back seed carefully. Cabbage diseases usually date back to the seed. Home-grown seed where a systematic selection of the best type heads is made is far preferable, being a great factor in developing a heavy yielding strain of cabbage. Most of the com- mercial cabbage seed is grown from immature heads, and absolutely no sel- ective system is practiced.

2. Treat all seed for disease, unless it is positively known to be free from all infection. Two years ago one batch of seed used in this county and not treated ruined the crop on many hun- dred acres—entire fields of eight to 10 acres not having a salable head, when other cabbage fro mclean, home- grown seed produced heavy crops, with other conditions equal. Soak the seed for 15 minutes in one pint of warm water, in which a corrosive sub- limate tablet, costing 2c, is dissolved. Dry on a white cloth quickly in a cool, shady place; a very quick, inexpensive operation which absolutely insures against black heart or stump-rot, the worst foes of the cabbage grower.

3. Prepare a fine, deep seed bed for both the plant bed and the field crop, plowing early, and harrowing at least once a week until setting time, or June 15, to secure fine pulverizing and to kill all sprouting weed seeds.

4. Fertilize well. Cabbage is one of the heaviest feeders grown. Experi- ments on 18 farms in Cortland County showed that 750 lbs. of acid phosphate (16%), with 10 tons of manure, gave the greatest net profit, or over $58 per acre for the fertilizers. Apply broad- cast one day to two weeks before planting.

5. Locate seed bed carefully, away from disease. Avoid the use of man- ure if made from diseased cabbage. Avoid manure from an old barnyard, or land which is flood washed, as such may contain mustard, which is pretty sure to bring club-foot. An old sod in pasture is best—and hen manure free from weed seeds is best for the seed bed.

6. Fertilize the seed bed with 100 lbs. of complete fertilizer and 100 lbs. of lime or wood ashes to the 2,000 sq. ft. necessary for one lb. of seed. This will set two acres of cabbage if it is an open bed. Sow the seed broadcast, mixing it with about equal parts of sharp sand, to increase the bulk and secure evenness of distribution.

7. Sow the seed early, as soon after May 1 as possible.

8. Screen the seed bed if possible, or at least one-half of it. This has been found to be most important in guaranteeing large, well-developed plants regardless of weather condi- tions, ready for transplanting by June 15. Last year was a very backward season, and those who did not screen their beds were two to four weeks lat- er in transplanting, and had far infer- ior plants. Cheesecloth is high this year, but at a cost of 2c per 1,000 plants fo rthe firts year the plants can be screened effectively, and if proper- ly cared for the cloth can be used four to six or more years. Last year some Cortland beds were covered with cloth which had seen five years' use, and was good for another year anyway. Drive down 10 to 12-inch stakes which are two inches square, at distances of about six feet apart, and enclose the outside of the bed with six-inch to eight-inch boards, well banked with earth on the outside to keep out in- sects. The cloth should be sewn to- gether o nthe sewing machine, with a strip of paper run through with it to give the material body and help to feed it, then tack closely to the board sides. A few tightly drawn wires across the center of the bed will keep it from sag- ging on to the plants, and if the wind causes it to whip up and down lay a strip or two of light board across the top. Remove the cloth a week to 10 days before transplanting, to allow the plants to harden off. The plants will grow twice as fast if screened in this way, as the moisture is more even and the temperature under the cloth is 10 to 18 degrees warmer. Also only one- half the seed need be used to set the same area to cabbages, as the germin- ation is much better. At $4 to $12 a pound for seed one can save the cost of the cheesecloth on the lessened a- mount of seed needed in a short time.

9. Transplate into the field not lat- er than June 15. July is far too late. The ground gets too dry, and the plants are handicapped for the whole season, often making less than half the weight per acre, all other condi- tions being equal. Late-set plants grow soft heads, with far less of them of marketable quality, while all are lighter in weight.

10. When transplanting dip the plants all over in a ¾-pt. Black Leaf 40 solution, with 4 lbs. dissolved soap to 60 to 80 gallons of water, and ¼-lb. arsenate of lead to each 14 qts. of the solution. This kills the cabbage lice which are such a pest later—also the cabbage worm—by poisoning the first hatch or crop. The later crop will then be so small as to be unimportant. A sticker made of 2 lbs. resin and 1 lb. sal soda boiled to an amber color in one gallon of water will insure the sol- ution's not washing off in rains.

11. Be sure the soil is very finely pulvrized and not too dry when trans- planting. Squeeze up a handful of soil, and if it will retain its shape it has moisture enough. Do not trans- plant just ahead of a big rain, as a crust forms about the plants, holding them back.

12. A variety of cabbage-setting machines is used in the county. One home-made barrel setter has been in use 25 years, and still does fine work. Perhaps the best results are obtained by the use of the Masters hand-setter, which sets the plant, waters it, and leaves a dust mulch about the plant. This permits of check rowing—about 21 ins.x34 ins. being the ideal distance for setting. This allows of two cultiv- ations the narrow way, and no hand- hoeing is needed.—Rural New Yorker.

SHEEP IN ORCHARDS

Sheep are very apt to gnaw the bark from young fruit trees, and if girdled it will kill them. We sometimes fence the young trees, and I have washed the trunks of the trees as high as the sheep could reach with a mixture of cow manure and water, quite thick. This can be done with an old broom and should be applied twice during the grazing season. I think sheep are beneficial to an orchard, but not as much so as hogs. Twelve shep could be pastured for the season, six months, on three or four acres if good pasture, but the ordinary pasture will do well to keep two sheep to the acre. There seems to be a notion that sheep will thrive on any old pasture, and that they will eat anything and thrive just as well as they will in a meadow. Sheep will not eat the red raspberry bush, but will kill black raspberries. Cattle are much better browsers to kill out bushes than sheep, but sheep will eat most weeds.

Woodlots and pastures do not go well together, and should be fenced apart, as the stock kill the underbrush and the wind blows the leaves away, leaving the roots exposed, as they are deprived of the leaf mulch, and the manure is dropped in the woods and the field grows poorer. I have seen this tried. A fence was made between the woods and the cleared land with the result that both improved rapidly. We do not feed grain when our sheep are on pasture unless there is a drought, when it is better to feed a little grain than to let the sheep run down.

Keep salt in a box for the sheep all the time. The box should have a cover and an opening at one side for the sheep to get at the salt. Salt the sheep a little each day in the morning, if not frosty, until the sheep get all they want, then you can give them what they want at all times.

Sheep need dry land as they will not feed on wet land if given a choice. My sheep alway winter better after a dry season. I think they have fewer parasites and the hay that grows the dry season seems to have better feed- ing value.

DAIRYING.

PREVAILING MILK PRICES

From reports of the U. S. Bureau of Markets we take the followng prices per quart of "standard grade" milk received by producers and paid by consumers in several widely scattered sections of the country during the month of October:

	Producer Receives cents	Consumer Pays cents
San Francisco, California	7.7	14
Denver, Colorado	6.7	12
Washington, D. C.	11.0	17
St. Petersburg, Florida	10.5	15
Augusta, Georgie	9.0	18
Chicago, Illinois	7.1	13
Fort Wayne, Indiana	5.9	13
Des Moines, Iowa	7.8	15
Kansas City, Kansas	7.0	14
New Orleans, Louisiana	9.5	16
Boston, Massachusetts	9.4	15¾
Detroit, Michigan	7.3	15
St. Paul, Minnesota	6.9	12
St. Louis, Missouri	8.2	14
New York, New York	8.3	15½
Cleveland, Ohio	8.1	14
Eugene, Oregon	7.5	14
Pittsburg, Pennsylvania	8.7	14
Philadelphia, Penn.	9.0	13
Memphis, Tennessee	8.5	16
El Paso, Texas	8.6	18
Salt Lake City, Utah	7.2	12½
Spokane, Washington	7.9	15
Milwaukee, Wisconsin	7.9	12

The prices quoted for producers selling to Chicago and Detroit are for milk delivered at the country shipping station, while the others are F. O. B. city and to get actual price the various transportation costs must be deducted. The average test required of producers is 3.5%, but it varies for the several cities from 3.25 at El Paso to 4% at Philadelphia. From four to five cents per point fat is paid per 100 lbs. milk for tests higher than that required. The consumer's price is for milk bottled in quarts and delivered.

FEEDING VALUE OF SKIMMILK

Experiment station trials on 740 pigs show that when properly fed as a supplement to cereal grains (say, 1 lb. grain to 3 lbs. milk), 100 lbs. of skimmilk will replace 28 lbs. of grain that would otherwise have to be fed without the skimmilk. Using this as a basis the Michigan College of Agriculture figures out the relative value of 100 pounds of skimmilk with grain at varying prices:

Cereal grains Price per 100 lbs.	Relative value of 100 lbs. skimmilk
$1.00	$ .23
1.25	.35
1.50	.42
1.75	.49
2.00	.56
2.25	.63
2.50	.70
2.75	.77
3.00	.84
3.25	.91
3.50	.98
3.75	1.05
4.00	1.12
4.25	1.20

Use your gifts faithfully and they shall be enlarged. Practice what you know, and you shall attain to higher knowledge.—Arnold.

COST OF MILK PRODUCTION AND FARMERS' PROFIT

The principles of cost acocunting used in manufacturing shcuild be applied to agriculture, not that the farmer may always sell above cost, for at times he sells below cost, but that he may know that the average selling price will at least equal the cost anl thus allow him tto break even. Were the results of such cost accounting for the business of milk production known to the farmer as well as to the consumer, the former would bestir himself to reduce his costs, while the latter, recognizing the narrow margin of profit upon which the farmer is working in producing a staple food product, would cease his blind criticism and be willing to pay a fair price for milk which is one of the cheapest foods.

According to the Central Experimental Farm, to find the cost of milk productiin is no sinecure in accounting, because of the complexity of the conditions surrounding the industry, but the importance of the product has led to many investigations with the following average results, using present day feed and labor charges:

Expenditure per Cow	
Feed at cost prices	$ 82.90
Labor per cow including nandling of milk	55.27
Interest and depreciation on herd per cow, $110 at 11%	12.10
Interest, insurance, repairs and depreciation of buildings	8.72
Depreciation of equipment	.50
Losses from abortion, tuberculosis, pneumonia, etc.	1.95
Veterinary services and drugs	.86
Cash sundries	1.96
Added interest of owner in excess of that exhibited by the hired help	6.00
Total	$170.26
Receipts per Cow	
6,167 pounds of milk at 29c per gallon	$178.84
12 tons manure at -2.00 per ton	24.00
Total	$202.84

Uunder the above conditions milk costs the farmer 27.6 cents per gallon, or 6.9 cents per quart. At most he is seliing fore 29 cents per gallonn or 7.25 cents per quart. The profit left to the farmer is very little over the value of the manure for his farm. In one investigation conducted on twenty-five dairy farms, keeping on an average of 460 cows, the average profit per cow per year was $8.23, while out of the twenty-five dairies 28 per cent. reaped no profit whatever.

While 6,167 pounds of milk per cow per year seem a small yield to some farmers, it is in reality a very good average, exceeding the average for Eastern Canada by 2,000 pounds. The farmer's remedy lies in increasing the average production of his herd.

A word to the consumer.—Comparatively speaking, milk is one of the cheapest foods. Instead of being regarded as a luxury, it should be regarded as a necessity. Based on food values, it has been estimated that if porterhouse steak is worth 30 cents per pound, milk is worth 16.5 cents per quart; if eggs are worth 30 cents per dozen, milk is worth 21 cents per quart; if fat fowl are worth 20 cents per pound, milk is worth 20 cents per quart; and if whitefish is worth 18 cents per pound, milk is worth 32 cents per quart. No common meat food is cheaper tha nmilk at 15 cents per quart. Moreover, milk is an already prepared food, requiring no fuel to cook it, a most important consider ation under present fuel conditions.

The question is, "Who is getting the best deal?" Certainly it is not the farmer.

WHEN LIKE DOES NOT PRODUCE LIKE IN DAIRY BREEDING

There are some who do not believe very strongly in a carerul, scientific breeding. There are many scrub cows that are enormous producers both in quality and quantity of milk. Then there are many pure-bred cows that are poor producers. A case has come to notice of a pure-bred cow which produced about twelve thousand pounds of milk in a year, mated with a sire whose dam produced eleven thousand pounds in a year, and the result was a daughter which was capable of producing less than six thousand pounds of milk in a year. It is because of occurrences like that that some dairy farmers look with some suspicion on scientific breeding of dairy cows.

The principle of atavism, which is breeding back to some primitive type, is well shown in such cases. The principle is frequently shown, not only in the breeding of cattle, but in the breeding of all other animals. In such cases the sire and dam that bred back should never again mate. It may be that the fault was not exclusively in either, but in the combination of blood. The intelligent breeder will see to it that such offspring is sent to the shambles.

The experienced breeder can usually see before the calf is two weeks old whether it will be suited to dairy purposes. She dairy animal will have a thin neck. There is a peculiar softness in the skin of a good dairy animal that all experienced animal breeders will quickly notice.

It is a fact that a great deal depends on the way calves are brought up. The best heifer calf may easily be spoiled by being fed fattening food, or by semi-starvation before it is a year old. Both of such procedures are injurious to the calf's digestion. If this is ruined in calfhood, the cow will be a poor producer, no matter what the sire and dam may have been.

It would also seem to go without saying that a great deal also depends on the way the mature animal is fed Fine blooded animals require the best of care and treatment if they are to do their best. If the owner is not able or prepared o give his cows the required treatment, or is too negligent to do so, his fine-blooded cows are certain to sink to a level, if not below, that of the scrub cows. And so it often occurs that the best bred animals are often branded as cheats, only because their owner did not properly treat and sustain them.—A. B.

Would You ?

Many investors would doubtless be only too glad to take advantage of a greater number of investment opportunities did they have the available capital. To such our

Systematic Investment Plan

will prove of special interest. This plan enables one to secure stocks and bonds by means of small monthly payments; a method that is meeting with great favor by a wide circle of conservative and thrifty investors.

IN BUYING CATTLE LOOK FOR POINTS THAT SHOW UTILITY

The value of an aninmal depends upon what it possesses. The better it can meet all the requirements of its function the more it is worth. In purchasing dairy stock the buyer must consider all things which influence their performance, and be able to measure their value. An animal with a pedigree may be a poor investment, for there are worthless pure-breds. A high grade of good appearance and conformation may be a law producer, and therefore an unprofitable animal.

The purchaser should consider on the buying of cattle whether they are free from disease, whether they are sound in every respect, regular breeders, capable of making or have made good records in production, and, if pure-breds, whether they conform to their breed characteristics.

It is very important not only to secure healthy animals, but from healthy, clean herds. The losses from diseased animals amount to many millions of dollars annually, and it is sustained very largely, if not entirely, by cattle owners. If right practices are followed, diseases of all kinds can be materially reduced, and many can be eliminatel. This can never be acccomplished if we all remain indifferent to them and take no interest in building clean herds.

Whether an animal is sound in everry respect does have a direct bearing upon its value. A cow or bull may have certain physical defects and stil not interfere with their functions. The cow may have lost one quarter of her udder and still be a large producer, but would not be worth as much as a cow equal in every other way with a sound udder. Just how much a defect depreciates the value of an animal must be left to the judgment of the purchaser. It it highly desirable that an animal be a strong and a refgular breeder, for, unless it will reproduce itself it is worth just what it will bring for beef, na matter what kind of a pedigree it may have or the kind of company it may have kept.

Dairy cows are valuable in proportion to their abilities to produce milk and transmit these qualities to their offspring. The many records which have been made the past few years are giving assistance to buyers in determining the value of animals in this respect. It is to me urged that the production of the animal be given careful consideration. The value of a bull lies in the productive powers of his ancestors, and his ability to transmit these qualities to his offspring. The cow's own record and those of her ancestors influence her value.

The buyer must be well informed upon facts influencing the value of dairy cattle, and then use the information when acquiring new blood for improving his herd. No advancement is going to be made by men who are indifferent to disease, reproduction and production.JHoard's Dairyman,

BERNARD FRICTION PULLEY

Nowadays, in this age of progress, life and labor saving devices, the necessity of a friction pulley on a gasoline engine is freely admitted. A friction Pulley is a great factor in saving belts and machines, and more, it is a safeguard to lives of men working with an engine.

GATHER UP OLD BARB WIRE

It is needless to say that barbed wire at the present time is very expensive. The Germans use it in tryinw to stop the Allies, and the Allies use it in stoppinf the Germans. As a consequence barbed wire is not easily obtained. On many farms there is a lot of old barbed wire lying around, serving no useful purpose at all. This it true whether it is lying around in the yard or whether it is fastened onto posts and hanging loose about the pasture fields. A cow is very likely to try to crawl through a fence made up of two or three loose barbed wires, This is especiaal true if there is some sort of tempting food on the other side of the fence in the next pasture. Such a wire fence should be stretched and stays should be put on between the regular fence posts. This may save much trouble with sore teats and udders, besides it may prevent considerable loss of both feed and ocws. A number of cows may go through the looses wire fence into the alfalfa field, eat too much of it and bloat and die over night. They may get into the cornfield, eat too much corn and waste a lot if it.

In case a cow does cut a gash in the teat or udder do not forget to wash it out thoroughly with a disinfectant. Soak it about 15 minutes in about a 2 per cent. solution of coal tar dip. Then apply some good salve. Vaseline is suitable. If no salve is at hand use a good grade of lubricating oil and even ordinary axle grease is good. Most any of these will keep the germs from getting in and it will keep the air from reaching the raw sore.

When a cow with such a sore udder is milked use care not to reopen the wound. Put the sore side of the teat against the side of the hand. I have seen milkers who have deliberately put the end of their fingers diectly on the sore. If the cow kicked she was punished severely. One cannot expect a cow with a partially healed barbed wire cut on her teat to stand absolutely quiet when it is being bruised in that manner,

It is always safe to tighten up the small wire fence and to pick up the small pieces of barbed wire lying around on the farm. Also remember that barbed wire is worth money nowadays.

CAKED UDDER IN HEAVY MILCH COWS

A simple congestion of the udder is usually noted in heavy milking cows shortly before and after calving. The udder becomes inflamed and causes discomfort. The swelling disappears in a few days and milk secretion becomes normal. In severe attacks, however, rub the udder with lard or camphorated oil several times daily. Leave the calf with the cow in most cases, as the kneading the udder receives from the suckling calf tends to reduce the swelling. Care should be taken to keep the cow from drafts and the udder is benefited by stripping and massaging. In severe cases applications of warm water hasten recovery.

A more serious form of caked udder results from exposure, inpury or excess of protein in the ration. This is known os mammitis. The labored breathing, dry mu zle and poor appetite soon attract the notice of the skilful herdsman, and examination will show one or more quarters agected. If the chill is noted, give a hot drench of one ounce of ginger in warm water, and blanket well. If the cow is costive, give one-pound doses of Epsom salts til normal conditions of the bowels return. Replace the grain mixture with ground oats and bran and. if possible, place the cow in a box stall. Bathe the udder with hot water frequently and if severe pain is evident apply extract of belladoona and support the udder with a bandage over the hips. Mercurial ointment is useful in softening the udder and relieving pain.

Should it be evident that an abscess is forming or danger of gangrene setting in, a veterinarian should be called at once, as loss of the quarter or death may result.

A heavy loss is sustained by breeders from the practice of "bagging" cows when going on sale. Cows in this condition should be handled very carefully and milked out as soon as possible.—G. F. S.

LIVE STOCK.

WHAT THE LIVE STOCK MARKET DEMANDS

The livestock breeder must always remember that market demands really determine to no small degree the policy of his breeding and feeding operations. The tastes of the consumer must always be catered to, if highest returns are to be reaped. We are speaking of beef cattle, sheep and swine, the ultimate end of all of which is the butcher's block, and the butcher is regulated by the customer. Markets in different large centres of the world differ because the demands of the different peoples differ, and changes, gradual though they may be, are ever taking place. Readers will remember when the bulk of the heavy cattle fed were finished for export to Great Britain, and in those days a considerable premium was paid for the heavy steer, as compared with his lighter brother. Steers weighing 1,400, 1,500 and 1,600 were finished in those days at three years and sometimes four years of age. The heavy steer has for several years been in the minority on our markets, but recently there has been, owing to war conditions, an increased demand for heavy shippers, and they have been selling at a considerable advance over the price paid for the best butcher's stock on the leading markets. No doubt when conditions are normal again, the market will revert to pre-war status and the well-finished butcher's steer will hold pride of place on most of our markets, with the exception of the few extra well-finished, heavy cattle which may find their way to Buffalo, Chicago or the Old Land.

The heavy steer has been largely replaced on our markets. Why? There are two main reasons. First, the consuming population in Canada has grown very rapidly during the last two decades, and, owing to various reasons, among them the high cost of living and the increased price of meat, has demanded smaller cuts, which come from smaller cattle. Second, the feeder has found that it pays him better to finish his cattle at an earlier age and put them on the market at from one to two years old, rather than from three to four years of age. The young animal makes most rapid gains, and, provided the calf fat is never allowed to slip off it, develops into a higher quality carcass, with more profit to the feeder. With meat very high in price, the average family is in such a position that the provider feels that he cannot afford very large cuts of this seemingly expensive food. However, he must have some meat, and what he buys, he wants good. The present-day market demands high-quality meat, which means high finish on the cattle. In times like these the feeder is in a quandary. He hesitates to feed high-priced concentrates, which may be needed for human consumption, to his cattle, and without a fair measure of these in his ration, he cannot get prime finish. Consumers should remember that the feeder never gets too much for his finished livestock. When meat is high, feeds are scarce and dear, and when meat is cheap, there is little profit, even if feeds be low in price. The feeder manufactures raw material into the finished product at a percentage profit which would not appeal to the city manufacturer, and yet he finds it good business to feed a large percentage of what he grows on his own farm and often has to buy more. Such a man has skill and deserves pay for it.

What are the market demands for cattle at the present time? A steer of the right beef type, compact, low-set straight, deep, thick and carrying an even coating of firm flesh and weighing over 1,200 lbs., would be considered a heavy-finished steer on our Canada markets and would command a premium of fifty cents or more per hundred over the good steer, not so highly finished and, therefore, no so heavy, weighing aobut 1,000 to 1,200 pounds and classed as "good." Then there is the less high-finished steer of the same wight and not showing so marked beef type and breeding. He is designated 'common.' Following this is the "good" steer of breeding and finish weighing 700 to 1,000 pounds, and the "common" or less breedy individual of the same weight. About two cents per pound is usually the difference in price between the 1,000 to 1,200-pound steer and the 700 to 1,000 pound steer.

Heifers may be divided into "good," "fair" and "common." The first named weighing over 1,000 pounds and fat, showing good beef breeding and type; "fair" being lighter and not quite so well finished, and "common" light, poorly finished and weedy.

Cows are "good" and "common" according to size, finish and quality, as is the case with the heifers. Heifers bring from a cent to two cents less per pound than steers of equal weight and finish, and the best cows are worth about one to two cents per pound less than the best heifers.

Bulls of size, quality, substance and breeding, big fellows, 1,800 lbs. or over, and well finished, may be classed as good or heavy, and sell about on a par with heavy, well-finished cows. All other lighter, poorly-finished bulls may be classed as "Common."

Veal calves are sometimes divided into "good" and "common" or into "choice veal" and "grass calves," the former being generally calves which have sucked their dams and been fed grain besides, and the latter older, grass-fed calves.

So far, we have been speaking of finished beef. Besides this, there are stockers, light, thin, young cattle, weighing 450 to 800 pounds. "Good" stockers are square, breedy youngsters, showing plenty of quality and constitution with the best beef type, while "fair" and "common" are the less breedy, scrub stuff.

Feeders are generally about a year older than stockers and in a little higher flesh, weighing say, 800 to 1,000 pounds. These may be divided into "good," "fair," and "common," according to quality and breeding.

The heaviest finished cattle which have been going out of Canada in recent months have gone to American markets. Buffalo gets a goodly number. Canadian cattle rarely show the finish that the heavy bullocks coming from the corn-belt states do and generally sell for about one to two cents less per pound on the Buffalo market. Although that market is often high enough to pay the drover for taking his heavy cattle across the line.

The main difference in butcher's steers and shipping steers is in the weight. The shipper desired is always a heavy steer, highly finished. A heavy home demand for high quality butcher's cattle has helped turn feeders to the "baby beef," the prime youngster marketed before fifteen months of age and weighing anywhere from 700 to 1,000 pounds, and to the lighter, earlier maturing steer.

There is another market term applied to beef cattle and with which all are familiar, viz., "canners and cutters." Canners are generally thin old cows no use for anything but canned beef. Cutters are cows in a little better condition—good enough to cut up on the block and sell out to the poorer trade at a comparative low price.

The biggest demand for young cattle is found in stockers weighing from 700 to 800 pounds and in feeders around 900 pounds. Beef-cattle feeders are catering to their home market demands. Lighter cattle should never mean that there can be any let up on finish. Every bullock marketed, large or small, must be deeply, evenly and smoothly finished, and this condition only comes with good finish.

Before leaving the cattle, there is another point which should be emphasised. It pays to dehorn all feeder cattle. This should be done when the calves are young by smearing the scurs with caustic potash, which prevents the growth of horns and does no injury to the calves. This is the best time to dehorn, but if not done then, it should be done before the cattle are put on finishing rations.

The heavy sheep seems to have had its day. Present-day market demands are keenest for the eight-pound lamb and the light ewe and wether. The range in weight sometimes given for choice lamb is 78 to 95 pounds; but lamb marketed weighs 90 to 110 pounds. The light sheep, 110 pounds to 135 pounds, is favored, but most of those of good breeding run heavier. Breeders of good sheep find it difficult to finish lambs and sheep at these weights. Our recognized breeds get heavier before they are done growing. Market demands in sheep and lamb are scarcely compatible with breeding practice. All market lambs and sheep should be compact, blocky, deep, thick animals, with a strong, wide, deeply-fleshed back and loin and with a large leg of mutton.

The Canadian hog market is divided into five classes, known as "selects," "heavies," "lights," "sows and stags." A select bacon hog, in normal times, weighs from 180 to 210 pounds. Under the first-mentioned weight he is light and over the last he is heavy. Sows and stags require no explanation. At the market the buyer sets the price on the car of hogs, according to the percentage of selects the car contains, buys them after they are unloaded in his own yards. This is rather unfortunate as we all believe that the only type of hog the Canadian farmer can breed and market successfully in competition is the bacon hog. It requires skill to produce the choice bacon hog with his long smooth side and his neat trim ham and the breeder and feeder is deserving of a premium when he produces the best. Cattle are classifi d. So are sheep. And both are bought and sold accordingly, but the farmer sells all his pigs, outside of the osws and stags, at a flat rate, regardless of bacon quality and proper weight and there is little encouragement for him to take extra pains to produce the highest type of bacon under such conditions. There may be difficulties in the way of buying according to a classification, but these should easily be overcome and packers and farmers alike would ultimately benefit from the change. As it is, the man who produces the best is often paid a smaller price than he should get and the feeder who puts out "light" or "thick fats" gets more than he should in order that an average may be struck and all paid alike. Pigs should be bought at the farmer's pen according to classification, and should be sold on the market in the same manner. Until this is accomplished, the bacon hog can never make the strides he should in this country, which, situated as it is, should produce none other.

Remember, in feeding and finishing, that breeding counts, and, starting with an anim laof the right type, plan to fatten and finish to the highest state possible at the weight which tops the market.

BREEDING EWE LAMBS A POOR PRACTICE

Many flocks of sheep have been established during the past year, and beginners in the business are in doubt as to whether or not it is advisable to breed ewe lambs. To these I would say that this is a condemnable practice, and that the most successful sheep breeders in the country today would not think of doing such a thing, no matter if the flock be large or small.

Common sense tells the reasons why. A sheep makes its best growth in the first year of its life. When the lamb is bred, and is obliged to take up a mothers duty, this growth is checked, and later when nourishing a lamb there is no time for the mother's further growth and proper development. Consequently she never attains to her full growth. The percentage of lambs raised from ewe lambs is generally very small, as nature has not as yet provided the lamb to become a mother at this early age. It is a poor practice indeed to try to raise lambs from lambs.

Even if lambs are well developed, and receive good feed and care, this evil practice of breeding ewe lambs will naturally result in the degeneration and ruination of a flock in the course of a few years. Many such instances have come to my observation, and it was astonishing to note how flocks once made up of strong, robust ewes, capable of producing a big, healthy crop of lambs, and yielding a heavy fleece, had degenerated because the offspring of these ewes were bred as lambs. The size of the individual was reduced, poor constitution resulted, and stamina and vigor were lessened. The quantity of the wool taken from such sheep was one-third less per head than that from sheep which were not bred as lambs.

Successful sheep breeders usually breed their ewes when about one and one-half years old, so that they will bring forth their first lambs when about two years of age, at which time they have almost reached their full maturity.

Frank Kleinheinz.
University of Wisconsin.

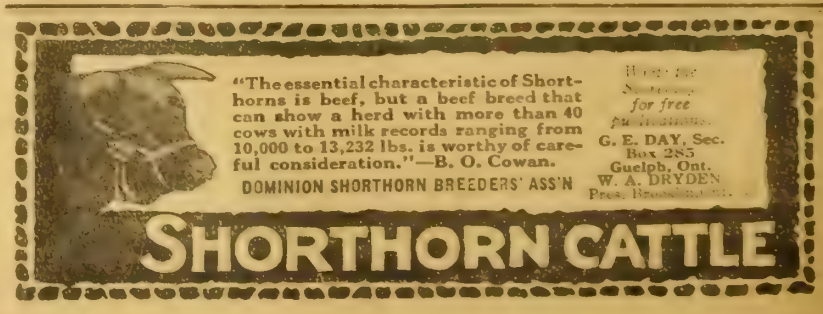
CROSS BREEDS OF SHEEP NECESSARY IN VERY FEW AND ONLY EXCEPTIONAL CASES

There seems to be an idea abroad amongst farmers interested in keeping a flock of sheeep that better results can be had by crossing breeds than by keeping strictly to pure breds. Many inquiries have been made relative to the question of what breeds make the best crosses. It is evident from the letters of inquiries that no satisfactory cross has been discovered and the results do not astonish the skilled shepherd.

Not Much Necessity for Crossing

Cross breeding like pure breeding must be done intelligently. Indiscriminate work in cross breeding will lead to degeneracy of stock and consequent loss to the breeder. There is not much necessity for crossing breeds of sheep at all. There are so many different breeds, each adapted to fit the different soils and climates found in pastoral and farming countries. Great Britain, where nearly all the breeds originated, is peculiarly adapted as the propagatng home and nursery for so many, fitting each breed with a constitution that can fully correspond with their peculiar surroundings. The Cheviot and Highland blackfaces can live and thrive on the mountains of Scotland where pasturage consists of rugged heathland. The Down breeds of which there are many, live and thrive on the upland fertile lands, while the lowland flats have produced the Leicester, Cotswold, Lincoln and similar breeds.

However, farmers who find that their time will not permit them to



"The essential characteristic of Shorthorns is beef, but a beef breed that can show a herd with more than 40 cows with milk records ranging from 10,000 to 13,232 lbs. is worthy of careful consideration."—B. O. Cowan.
DOMINION SHORTHORN BREEDERS' ASS'N

Box 285
Guelph, Ont.
W. A. DRYDEN
SHORTHORN CATTLE

follow after the breeding of pure bred sheep, will obtain the best results by keeping a pure bred Leicester ram at the head of their flock of common ewes, especially if they are of the Down variety. In Scotland they are pre-eminently chosen as the best type for crossing. The grey-faced lambs from Highland ewes, and the half-bred lambs from Cheviot ewes by a Leicester sire are unrivalled either for fat, the lamb trade or for carrying over as one-year-old "wethers," as they are termed in the country. In New Zealand and Australia also, where mutton rams have been extensively used to improve the common Merino flocks, to uspply the demand for dressed meat, and also meet the conditions of the wool mrakets, the Leicester has been extensively used, and the cross has given fully better satisfaction than any other. The merits of the Leicester for crossing purposes is its aptitude to fatten, hardihood and soundness, from a mutton standpoint, giving both weight and quality, while its heeece is also of a high quality. For crossing with the fine wooled stock, the Leicester is considered the best where crossing and grading of sheep has been given extensive trials.

To get the first crosses, which are the only crosses that on the average are worth while, a farmer must be prepared to keep two distinct pure breeds for his breeding stock. Haphazard crossing and re-crossing for two or three years with crossbred stock is generally the plan with most farmers who go in for cross-breeding, and a gradual lowering of the sheep standard is the result. To keep ewes for breeding from a flock of half breeds (Leicester-Cheviot crosses) will have good results if a Leicester or half berd ram is again chosen as the sire of their lambs.

The Half Bred Crosses

With only one exception, no cross-bred ram is ever used in Britain, the exception being the first cross between the Leicester ram and Cheviot ewe. The quick fattening quality of the Leicester, together with the size and weight of the fleece that it gives, is supplemented with the vigor and the fine milking qualities and wool of the Cheviot. The reason for these two varieties of sheep blending so well together is perhaps due to the large infusion of Cheviot blood that was introduced in the building up of the Leicester breed. The term Border Leicester is derived from the fact that they originated in the border counties near the home of the Cheviot sheep.

If it is found necessary to use cross bred ewes by any farmer who finds it impossible to procure the breed of the kind required, it is only wise for him to use crosses that are a first cross; that is between two pure breeds. Again, the ram that is chosen for the cross bred ewes will give better results if he is chosen from one of the pure breeds of the breed from which his ewes are crossed. But all crossing of sheep if done to get the best reults, necessitates extra expense in purchaing pure ewes at intervale to keep up steady improvement. To keep ewe flocks pure, without buying, necessitates the purchase of other rams and the flock must be bred in two parts, one part being mated to rams of tehir own breed to furnish fresh ewes to keep up the breeding flock.

Keeping Ewe Flock Pure

There is a popular idea amongst farmers that the crossing of breeds has the effect of giving greater vigor and more rapid growth than characterizes eithe rof the parent breeds. But this has never been proven by actual experiment and the variety of breeds are so many that they are equal to the varying conditions found in Easteren Canada, so that crossing, unless in exceptional cases, is not necessary. Where extreme conditions exist, as there are in Britain, the crossing a Highland with a Lowland breed has its possible advantage, but crossing can only be followed when the main ewe flock is kept pure.

The Balanced Ration Pays

Which one of these bacon hogs would you rather get paid for? Imperfect feeding will get you a *certain amount of bacon*, but it is one of the causes of soft, flabby quality. On the other hand, the use of Monarch, a properly mixed and balanced ration supplying everything the hog requires in exactly the right proportions, will get you *far more bacon* to take to market. Experience has shown that hogs make larger and more economical gains when fed with

Monarch Hog Feed

The quality of bacon will be firm and of good texture, which is essential if you wish to get the highest prices. Monarch Hog Feed is properly mixed and is very palatable; no single feed can equal it. Its high protein content is splendid for growth, and the nutrients are so mixed as to supply every requirement for growing pigs. It gives them stamina, energy, vigor and size.

Monarch Hog Feed makes more pork and better pork and shortens the period of fattening, thus lowering the cost of production.

Order a ton from your dealer; if he cannot supply you, write us direct and you can always depend on getting deliveries.

TAKING TIME TO TRIM

The percentage of ram lambs among arrivals of native lambs at the markets this year has been larger than ever before. It is conservatively estimated that only about 15 percent reaching Chicago this season have been wethers. Farmers who raise a few sheep do not generally take time to trim the lambs. On the other hand western sheepmen universally trim and dock, and in consequence get a higher price. When native lambs have been bringing $16 to $17.25 per cwt. at Chicago, western lambs have sold for $17.75 to $18.40 on the same days. As proof that the principal difference is in the trimming and docking, a load of native lambs prepared like westerns sold recently at $18.50 which was the extreme top at that time. This was $1.50 per cwt. above the top for shipments of native lambs that included rams instead of wethers.

Market men have always insisted upon the big returns for the little time it takes to perform the simple operation on ram lambs. It is just as necessary as to alter pigs and calves. Many men are putting in breeding ewes this fall for the first time and they should remember this demand of the market. When lambs are a week or two old the operation is easy and very successful. The wether lambs carry more flesh and finish in the fall and dress out more attractive carcasses than ram lambs. The contrast is very great on lambs marketed after July 1. Of course they sell higher.

Failure to attend to such simple but important matters is commonly a farmer's trait. Rush of work causes delay from time to time. Only a determination to figure on the profit of each duty in the care of animals, and do the thing that will eventually make the most money, will keep a busy farmer in line to give his stock every necessary attention. The time spent at such work may easily bring in $50 to $100 per day. This is the pay for brains, for management, for raising lambs instead of having lambs that "just growed."

HOGS AND DISHWATER

It does not pay to take a chance feeding hogs swill which contains strong soap or some of the washing powders. This is particularly true of dishwater which may contain washing powder or soap. The writer is convinced that table slop of this nature caused the death of a brood sow. Table refuse now fed to hogs is carefully scraped from the plates, kettles or utensils, and soapy water is thrown away. This trouble also occurs in feeding hotel slops, which in many instances have caused loss of hogs because of the harmful contents in the dishwater. If it were possible to have the table scraps kept separate from the dishwater, hotel and restaurant refuse could be economically used in pork production. A Cornell bulletin has been issued on the subject, and it is interesting to note that it says: "It seems better to abandon altogether the habit of giving dishwater to hogs. Although the feeding of garbage is generally condemned, the scraps of vegetable refuse could, perhaps, if properly collected, be used with safety. But certainly pure water is a much more wholesome drink, even for swine, than dirty dishwater. When the subject of 'swill feeding' as a business is studied, and the conditions as they exist are understood, the wonder is not that some of the hogs die, but rather that any of them live."

SELECTING THE RAM

In buying a ram the man to avoid is the man who is not a breeder but a dealer. One who picks up his rams here and there, fits them up and sells for several times their real value.

If one can buy or get in exchange a ram that has been used so his lambs can be seen it is of the greatest advantage. The na man knows what he is getting.

Cattle and sheep in Scotland remained practically unchanged in number last June compared with June, 1917, according to the agricultural returns, but swine declined 4 per cent on account of diminished feeding stuffs.

Suint is a greasy product found in wool. It contains considerable potash which has never been fully saved. English authorities say that the waste in the Bradford woolen district would provide all the potash needed by English farmers!

THE HORSE

SUPERPURGATION

Superpurgation, or over excitement of the intestines from undue action of purgative medicine, is a condition of the bowels frequently seen. The susceptibility of horses to the action of purgatives and other medicines vary greatly. While in a majority of cases this is governed to a great degree by size and breeding (hot blooded horses being more susceptible than those of cold blood, hence require smaller doses in proportion to age, weight, etc.), we find that horses of like breeding exhibit various degrees of susceptibility. It is not possible to tell with certainty by the general appearance of a horse just how large a dose of aloes or other purgative medicine it will require to give the desired action, which usually is moderate purgation. In some cases where an ordinary dose has been given, one that is in proportion to the size and breeding of the animal, practically no purgative action is produced, while in another case of apparently the same nature, in a horse of apparently similar characteristics, severe purgation may be the result. Hence we can readily understand that the most observant and skilful may be disappointed in the operation of a purgative. Some horses, without showing any indications, are particularly susceptible, while others are the reverse. Then again, the susceptibility of a horse varies at different times, owing largely to the general condition of the digestive tract, which may not in any way be indicated by his general appearance. At the same time in cases where reasonable care and intelligence is exercised in regard to the size of the dose and after treatment it is seldom that serious results occur. It is possible that untoward results may occur in any case. The results of a purgative depend, not only upon the size of the dose and condition of the animal, but largely upon the quality of the drugs and upon the treatment of the animal both before and after administration.

When the necessities of the case permit, the patient should be prepared by not allowing anything but a little bran to eat for twelve to eighteen hours before administration. Afterward no solids but bran should be allowed. Water should be given often and in small quantities (if the weather be cold the chill should be removed from the water) until purgation commences. After this solid food should be given in small quantities. Gentle exercise the first few hours after administration hastens the action of the purgative, but on no account should the horse be exercised or worked severely, nor should he be given any exercise during the action of the dose. It is customary, and good practice to allow perfect rest after the administration of the dose until the action has ceased and the bowels become normal.

While there are, in most cases, more or less nauseation and distress, caused just prior to, and during the visible action of the drugs, these are often so slight as to escape observation. But irrational treatment such as allowing solid food, copious drinks of water, fatiguing exercise, etc., increase the irritation and distress. It is good practice to administer a little ginger with the purgative, especially with aloes, as this tends to prevent griping.

The usual symptoms associated with the actions of a purgative are slightly hurried breathing and impaired appetite (not always noticed), when purging is about to commence, and the patient usually becomes more or less nauseated and suffers from slight griping pains. If the purging, however, does not proceed to an undue extent these symptoms soon subside,and the nausea is succeeded by a desire for food. Should the patient be constitutionally weak, or be driven or ridden for a considerable distance, or worked while the purging continues or too soon after purgation ceases, or if the dose was too powerful in the first place, or if two or more of these circumstances operate, the purging will probably become excessive and long continued, and the life of the animal will thereby be endangered. While under ordinary conditions purgation should commence in eighteen to twenty-four hours after the administration of the dose, and continue for a like period, it is not unusual for a longer period to elapse before its action is noticed, and its duration may also be extended beyond the normal time. A purgative dose should not be repeated (except in exceptional cases) for at least thirty-six hours, and then only a small dose given when the first has not operated. We are assuming that the drugs given are of good quality, as, of course, no dependence can be placed upon the action of drugs of inferior quality. Purging may continue for a long time, but as long as the patient is kept quiet and the appetite remains good, the pulse normal or nearly so, little or no donger need be apprehended. If, however, the appetite fails, the pulse becomes thready, and the animal weak. prompt treatment is necessary. The symptoms indicating too violent and long continued action of a purgative are. staring, glassy eyes, frequent indistinct or intermittent pulse, voilding foul smelling or bloody fæces, distended abdomen, with or without evacuations of gas, well marked loss of appetite, and general weakness. The patient usually stands still, or paws and wanders about, but seldom lies down. Horses suffering from any acute disease of the respiratory organs are particularly susceptible to the action of purgatives, and in such cases even reasonable doses act violently.

Treatment.—As stated, when the appetite and strength remain practically unimpaired, even though purgation continue an abnormal length of time, it is not necessary to interfere; but should the symptoms noted be observed, means must be taken to check the purgation. This, however, should not be done too quickly. Care should be taken not to allow water to be taken in large quantities at a time, as the thirst is usually great, and the horse will drink inordinately. The addition to the water of about one-quarter of its bulk of lime-water gives good results. He should be allowed small quantities of anything he will eat. Dry food, as hay and oats, are preferable. If very weak, stimulants as 4 to 6 ozs. of whiskey or brandy should be given every few hours. If purging continues treat as for diarrhoea, viz., give 1½ to 2 ozs. of laudanum and 4 drs. each of powdered catechu and prepared chalk in a pint of cold water as a drench every four or five hours until purging ceases. Care must me taken to not continue the latter treatment after purging ceases, as there would be danger or causing constipation.—J. Hugo Reed, V. S.

AZOTURIA

While azoturia is not a disease of the digestive organs it is a dietitic disease and quite a common and serious ailment, hence we may be excused for discussing it in this connection.

It is a disease peculiar to the horse and the mule, especially the former. It is characterized by partial or complete arrest of the power of locomotion caused by partial or complete paralysis of the posterior or anterior limbs (usually the former) with a morbid change in the character of the urine. While in all cases the kidneys become involved it is not primarily a disease of these organs. Some authorities call it a disease of the blood. while others class it as a disease of the nervous system. As it occurs after a period of idleness accompanied by high feeding we feel justified in classing it as a "Dietetic disease." It would not be wise to discuss the various views as to the nature of the disease here, as a knowledge of this is valuable only from a scientific standpoint. Besides, as opinions of scientists differ we would gain nothing by the discussion. We shall confine our discussion to the conditions under which the disease occurs, the symptoms and treatment, both preventive and curative.

Causes.—It is a disease of the well kept horse. It does not appear in poorly kept and neglected animals. The predisposition to the disease is produced by idleness and good food. An attack is always preceded by a period of idleness, the period varying to a considerable extent—some say from two days to two weeks or longer. A few days' idleness is more likely to be followed by an attack than a longer rest period. We cannot cal to mind a case that occurred following a rest of less than three or more than ten days. Just why this is a fact cannot be satisfactorily explained. During a period of complete rest and good feeding the equilibrium between repair and waste is altered or partially suspended and plethora is established. The various excreting organs in some cases become more or less inactive. Certain products of the food which should be eliminated by said organs accumulate in large quantities, but no physical symptoms are noticeable that will lead the attendant to suspect danger until the animal is put in motion. Then these products, which are supposed to be of a nitrogenous nature, are converted into various substances, chifly uric and hippuric acids, and are thrown upon the kidneys for elimination or excretion. The kidneys being unable to perform the increased function these materials are practically thrown back upon the system, causing a form of blood-poisoning of the muscles. This produces paralysis, either partial or complete of the muscles involved, depending upon the severity of the attack. It is probable, if the period or rest be extended beyond ten days or two weeks, that the ssytem becomes accustomed to this condition. The excretory organs then regain their activity and eliminate the materials which at an earlier stage in the period of idleness would have caused the disease, had the animal been subject to exercise.

We cannot tell why some animals suffer from the disease under conditions to which several have been subjected, and the others go free. Neither can we tell why a horse may be sub-

MADE IN CANADA
IMPERIAL BRAND HARNESS
THIS TAG IS THE TRADE MARK
When you buy A HARNESS
When you go to the Harness Dealer, do you just say, "Let's see some Harness?" If you do, you risk buying a set that is not guaranteed by the maker or that does not even have the maker's label on it. In buying Harness know the BRAND and the maker's name. Our goods are trade-marked —IMPERIAL BRAND and known from coast to coast as high-grade. If your dealer does not have IMPERIAL BRAND HARNESS we can supply you direct. Our prices range as low as $22, single set complete, and $39 team set, without collars. Our "Team Special," No. 640 is the most popular moderate priced team Harness in Canada. It is sold from Halifax to Victoria express prepaid to any station in Canada on receipt of price. Our No. 56 Rawhide Lined single Harness, is exceptional value at $35 per set. Write us for anything in the Harness line—we have it—and our prices are as low as honest work and materials allow. Satisfaction guaranteed.

d to such conditions many times impunity and another time be ked with the disease. We know such are the facts, but cannot in them.

e notice that horses accustomed pasmodic exercise, or, in other ls, accustomed to standing idle a few days at a time and then ed or driven, seldom suffer from ria. Most victims are those that accustomed to regular work and food, and from some cause spend e days or more in idleness, and ive their usual amount of grain, are then given exercise. Exer- following rest is necessary to e the trouble. Cases have been ed by horses becoming halter-cast a few day's rest, the exertion ng the efforts to rise having the e effect as exercise or work. It is m that a horse that stands in a stall is attacked. In most cases akes sufficinet voluntary exercise eep the excretory organs active, e prevents an accumulation of products noted. As the disease ways serious (especially in heavy es) and in severe cases often , it is obvious that preventive ment is advisable. This, of se, consists in giving daily exer- to well-fed horses, even if for a few minutes. If conditions e this impossible the grain rations ld be largely reduced and suppde- ted by bran, or, if possible, the e given a roomy box stall during period of idleness.

mptoms.—After a period of rest horse is hitched and, of course, is ly feeling in higher spirits than l and anxious to go. After be- driven a variable distance, from a hundred yards to several miles, symptoms have been noticed in cases very early, and in rare s not for a few hours), he begins se ambition, hangs back, sudden- es stiff or lame, either in a hind re leg (usually the former.) It is thought that he has picked up ail. He perspires freely; the les of the loins or croup, or the leg, those of the forearm and lder, become enlarged and hard- . The respirations become labor- he expressions becomes anxious, pulse frequent and strong, he bles, looks around at his sides, rently suffers pain, and he may own, roll and regain his feet. His becomes arched, he staggers, kles at his fetlock joints, he is g coontrol of his limbs, the whole shakes, he tries hard to retain standing position, but eventually . He may rise on his forefeet, rarely regains the standing pos- , or drag his hind part along upon d fetlocks, and fall again. He rally struggels violently, often be- e sdelirious, and frequently un- rolloble. If he voids urine, or it drawn with catheter, it is noticed e thick in consistence and very in color, very strongly resembl- strong, thick coffee in appearance. is totally unable to rise or stand fted by the use of slings or in r ways, but his power to struggle ery well marked, and it is often ult to prevent him injuring him- and his attendants.

ese are symptoms of a severe , and, of course, are more or less ified in cases of less severity. In cases the patient is able to retain standing position, but the partial omplete loss of power to control limbs is noticed. The lassiitude, rgement and hardening of the cles, anxious expression, and ap- nt colicky pains, and the marked ge in the appearance of the urine, are more or less marked in all cases.

Treatment.—In most cases, when the first symptoms appear, if the horse be allowed to stand still for a few hours and is made as comfortable as possible he will recover without treatment. Hence, as soon as the slightest symptoms of the disease are noticed in a horse that is being driven, ridden, or worked or exercised in any manner after a period of idleness, the driver should not attempt to get him home or to a veterinarian, but quietly lead him to the nearest comfortable quarters (if in fine weather a field or fence corner will do) and send for the nearest veterinarian. If the patieit has trouble in standing, care should be taken to support him, if possible, for a few houds, when he will probably have regained sufficient power to support himself. It is good practice to administer a purgative of 7 to 10 drs. of aloes (according to the size of the uatient) and 2 or 3 drs. of ginger. If the weather is cold, clothe heavily and keep warm. If he can be kept on his feet for a few hours a recovery will take place, and he lan be moved to his own or other comfortable stable in tewenty-four to forty-eight hours or in some cases sooner; in rare cases it requires a longer period of complete rest. If the patient falls and is unable to rise he should be loaded on a boat or truck and moved to some roomy and comfortable place and made as comfortable as possible.

If the services of a veterinarian can be procured it is always wise to do so in severe cases of this disease, as he will follow treatment that can be given only by a veterinarian who has the proper instruments and understands the use of the drugs that are used in treatment.

When such can be procured it is good practice to administer a purgative and follow up with the administration of 1 to 1½ drs. of iodine of potassium every five hours for about twenty-four hours. Injections of warm, soapy water per rectum should be given every few hours to hasten action of the bowels. The urine should be drawn off with a catheter every six to eight hours, and if the kidneys become active ½ oz. of the nitrate of potassium (saltpetre) should be given three times daily. It is necessary for an attendant or two to remain with him, and in some cases it is necessary to hobble his feet to prevent injury to himself or attendants. If the bowels and kidneys can be kept active, and delirium does not increase, there wil be reasonable prospect of recovering, but if the symptoms continue to increase in intensity death will result, usually in from two to three days.

When recovery is about to take place and the patient attempts to rise, he should be assisted. In some cases it is wise to use slings to get him on his feet, but if he cannot stand when raised he must be let down again.

During treatment he should be allowed water frequently, but should not be allowed to drink large quantities at a time, and, if he will eat he should be given bran and a little good hay, or grass if it can be procured. At any time during treatment, if colicky pains be shown, it is food practice to give an anodyne as 1 to 2 ozs. tincture of belladonna or 1 to 1½ ozs. chloral hydrate.

As stated, in all, except very mild cases, it is wise to employ a veterinarian, as complications are liable to arise which he will probably be able to combat and which would not be understood by an amateur.—J. Hugo Reed, V. S.

Everybody interested in road improvement ought to do all he possibly can to spread that interest among others. It is the easiest problem that is before the people to solve, if the people only get thoroughly interested. Where there is a will there is a way.

WHERE SHALL I SHIP MY FURS?

The Important Problem

Every Fur Shipper Must Solve to be Successful

You are receiving price lists and other literature from many different Fur Houses—all claiming to pay the highest prices, etc., etc. This makes it difficult for you to choose your Fur House and a wrong guess may mean dollars out of your pocket. You must exercise great care and caution in choosing the Fur House to whom you are going to entrust your catch of Fur-bearers. You can solve this important problem by making "Shubert" a trial shipment.

For more than thirty-five years "Shubert" has been paying Fur shippers "more money" for their Furs—always giving an honest and liberal assortment—paying the highest market prices—sending returns out promptly, in other words, rendering "better service"—"quicker." "Shubert" offers you the SERVICE of an honest—reliable—responsible—safe Fur House—where you take no risk. "The Shubert Guarantee" protects you absolutely. A trial will convince you. Get a shipment off—TODAY.

Write for "The Shubert Shipper," a complete Fur Market Report and Price List Issued at every change in the Fur Market. It's FREE—Write for it—NOW.

POULTRY.

THE N. B. PROVINCIAL POULTRY SHOW

The Westmorland Poultry and Pet Stock Association and the York County Poultry Association are now combining efforts and propose holding a union or a Provincial Show in Fredericton on January 7th, 8th and 9th, 1919. Previously each of the above Associations held a separate show, but by combining a larger show than either will result and the members of both Associations are exerting every effort to make the exhibition this winter a record one. The show is conducted largely by the York Co. Poultry Association, of which Mr. M. E. Hagerman of Fredericton is secretary, on the understanding that next year the Show be held in Moncton.

There are several departures from previous shows in the matter of judges, classes, prize money, etc. It was felt that in the interests of the poultry industry a disinterested judge from outside the province should be secured, by which means local breeders would have an opportunity of learning how their birds compare wtih those seen at the larger exhibitions in the West. Professor W. R. Graham of the Poultry Department, Ontario Agricultural College, Guelph, will judge all classes. Professor Graham has a wide reputation as an authority on exhibition poultry as well as the utility side of the business. He has had much to do in years past with the making of the present standards for exhibition poultry and is well acquainted with this part of the business as it is conducted in practically every part of the cointnent. Professor Graham is at the head of one of the largest poultry Experiment Station in America, and has an international reputation of being one of the most thorough and up-to-date experimenalists in his line. He has developed one of the heaviest laying strains of Barred Plymouth Rocks in existence and the influence of his stock is being widely felt not only throughout the Province of Ontario, but every Province of the Dominion.

Approximately $600., it is expected, will be paid out in prize money. The money on the various classes has been increased in most cases from 50 to 100% over previous years which should be considerable inducement for the exhibitors to put up strong classes. The majority of the varieties of poultry recognized by the American Standard of Perfection are in the premium list, and breeding pens are catalogued for the more important and widely bred varieties.

Unlike previous years classes are included for utility chickens of our more important general purpose varieties, e.g. Barred Plymouth Rocks, White Wyandottes, Rhode Island Reds, Orpingtons and Sussex. This will give the farmers who do not wish to breed exhibition chickens and come in competition with the expert breeders, an opportunity of taknig part, and it is hoped that many will avail themselves of this opportunity. Classes are also provided for the members of the Boys and Girls Poultry Clubs organized under the direction of the Department of Agriculture during the past spring. Many of these amateur poultry raisers will no doubt take a keen interest in the Show and have large and excellent displays. Utility poultry is placed on exactly the same basis as exhibition poultry. The same prize money is paid and the same entrance fee required. By developing the utility side of the poultry business the greatest results from poultry raising will accrue. Classes are also provided for dressed poultry and eggs on which liberal premiums are paid.

A large list of Specials have been provided by the two poultry Associations. This includes a large number of silver cups, some of which are donated by individual members of the Associations and others by interested citizens. Mr. Jas. S. Neill of Fredericton donates a silver cup for the largest and best exhibit of Exhibition Plymouth Rocks, Wyandottes or Rhode Island Reds. Mr. A. C. McCulloch, Provincial Poultry Superintendent, donates a silver cup for the largest and best display of utility Barred Plymouth Rocks. This is open to both members of Boys and Girls Poultry Clubs and other breeders. Two incubators will be donated by the Department of Agriculture for the largest and best display by the Boys and Girls Poultry Clubs. Other Specials include bronze medals by the Canadian Poultry Review of Toronto, and others by various interested Poultry Supply Houses, etc.

During the exhibition Professor Graham will give two lectures. One on "The Economics of Poultry Raising." The other on "The Marketing of Poultry Products." Both of these should be of unusual interest to anyone interested in poultry raising. Arrangements are also made for two or three lectures by Mrs. Jas. Stoddard of Mount Lenson, Nova Scotia. Mrs. Stoddard has for some years conducted a demonstration flock under the direction of Mr. Landry, head of the Poultry Department of the Agricultural College, Truro, N. S. Mrs. Stoddard has made an unusual success of her work and comes prepared to give the details of her business as she has conducted it. Mrs. Stoddard is an extremely interesting lecturer and her addresses are well worth hearing.

Mr. M. E. Hagerman, Secretary of the York County Poultry Association, will be glad to furnish premium lists and any other information possible to interested parties.

KILLING MARKET POULTRY

There are different ways of killing a fowl but one of the best is to bleed it by severing the arteries in the neck. From the ceiling of the room in which the killing is to be done, the fowl is suspended by the feet at about the height of the shoulder. Any stout cord with a short stick in the end will do to wrap round the bird's feet. The wings are crossed at the back so that the bird cannot flutter. In that position it is ready to be bled.

For this purpose a particular kind of killing knife is necessary. The blade of the knife should be of a heavy piece of steel, about 2 inches long, ¼ inch wide, and ⅛ inch thick on the back. It should be round to a sharp point with a straight cutting edge, the slope of the point being taken from the back edge rather than from the front edge. The handle should be fairly stout so that it can be grasped readily.

It takes but a fraction of a second to suspend the bird for killing, and when all is ready the head of the fowl is taken in the left hand and the killing knife in the right hand. With the thumb and forefinger of the left hand the mouth is forced open by pressure and the knife is inserted into the mouth with the blade pointing toward the back of the head. The knife is then forced up to the juncture of the head and neck where the arteries come down on each side of the neck; these are severed, which causes the fowl to bleed freely.

Immediately after the fowl has been bled the knife is forced into the roof of the mouth. This is done by withdrawing the knife from the juncture of the head and neck, turning it over so that the back of the knife now passes along the upper beak into the groove in the roof of the mouth. It is immediately forced into the brain cavity, so that the brain is pierced. If the brain has been pierced properly the bird will squawk and it will also make a convulsive movement which tends to loosen the feathers located along the feather muscles. Proper piercing of the brain makes plucking much easier, whereas if the brain has not been properly pierced, the feathers ar hard to pluck and the skin is frequently torn badly.

Maxwell
"Home" Washer
—the washer that not only washes the clothes mechanically, but does it better than they can be washed by hand. There's no "slumping" by the "Home" Washer—light or heavy articles are cleaned with equal thoroughness. There's no tearing of clothes, either. And it does the work in half the time! No more long-drawn-out, backbreaking washdays anywhere there's a Maxwell "Home" Washer. Just put the clothes in, and the rest is handy work at all because the "Home" Washer is so light, compact and convenient. Enclosed gears make it absolutely safe: "springs" make cover lift easily. Made of best quality cypress, handsomely finished. Runs by hand-power or water-motor. See it at your dealer's.

to-day interesting Booklet

Just as soon as the bird has been bled and the brain pierced, a blood-can, which is weighted in the bottom, is hooked on to the lower mandible to catch the blood; it also prevents the bird from moving its body too much.

The sooner the bird is plucked the better. Experts can pluck a fowl in less than one minute. The birds are always plucked dry; it gives them a much nicer appearance and they will keep longer.

In dry plucking, rapidity of movement is necessary. Different pluckers have different ways of plucking, but we have found the following order to be convenient and rapid: Neck, breast, wings, legs, back and body.

As soon as the blood-can has been hooked on the beak, a squeezing motion with the fingers round the neck from the base toward the head removes the feathers of the neck. The soft feathers covering the breast are removed readily by a sort of rubbing motion, rubbing the opposite way the feathers normally lie. Then the wings are held firmly in the left hand and the main wing feather are removed with one jerk by the right hand and the main tail feathers are given a slight twist which should remove them with ease. The thighs and legs are easily plucked in much the same manner as the neck; then finally the back and body of the bird are plucked. After plucking has been completed pin feathers may be removed by using a dull, round-bladed knife. Care should be exercised not to tear the skin. Even small blemishes lower the market value of the dressed bird.

After the bird has been dressed the head and the feet should be washed with a stiff brush. The vent should be squeezed, and if any food remains in the crop an opening should be made just above the shoulder and the food taken out.

The head should be wrapped in parchment paper. Then the bird should be plcaed where it will cool properly, because it is necessary that the heat pass out of the body as soon as possible after the fowl has been killed. Proper cooling prevents bacteria from developing and tends to keep the fowls much longer.—M. A. J.

FLEAS IN HENHOUSE

Will you tell me how to get rid of fleas in my chickenhouse? Spraying does not seem to do any good. I have heard of some chemical which, when burned, gave off a poisonous gas. What is this, and how much would you need for a house 12x30, eight feed front and four feet rear? M. R. S.

Ordinary sulphur is sometimes burned to rid poultry-houses of parasites, and is probably as effectual as anything that you could safely use, though few poultry-houses are sufficiently tight to make fumigation a practical method of exterminating vermin. Thorough cleansing of a house, after removal of all loose litter, and painting or spraying with a coal tar disinfectant or other suitable insecticide is usually more satisfactory in results than attempted fumigation with poisonous gas. If you wish to fumigate, however, close all cracks of the henhouse about windows and elsewhere and burn several pounds of sulphur by making a conical heap of it in an iron pan over a tub partly filled with water, turning a little wood alcohol upon it and touching a match at the top. Five pounds of sulphur does not cost much and will make quite a smudge while burning. It will not kill poultry parasites, however, unless the resulting gas is closely confined to the building, and the poultry-house will require considerable airing before the fowls can be readmitted.

TONICS FOR HENS ADD TO PROFITS

To get the best results from the poultry yards, great care must be used to protect chickens from diseases induced by changes in the weather, by poor ventilation, exposure to drafts and other things. One means of securing such protection is the use of tonics. A tonic of tried quality is suggested by N. E. Chapman, poultry specialist of the agricultural extension division of the Minnesota College of Agriculture. It is made as follows: Magnesium sulphate, 10 ounces; magnesium oxide, 1 ounce; iron sulphate, 2 ounces; ground ginger, 2 ounces; sulphur, 3 ounces.

One tablespoonful of this mixture in moist mash is a dose for twelve birds. Such a dose should be given each morning for three mornings, and then discontinued for a week or ten days.

Permanganate of potash may also be used in the drinking water—as much as can be piled on a ten-cent piece, in a gallon of water.

Apparently chickens are subject to much the same ills that afflict human beings at this season of the year—colds, catarrh, bronchitis, pneumonia, diphtheria and roup.

The careful poultryman will visit his roosts at night and look and listen for signs of colds. He will at once remove any birds showing symptoms of disease in order that the rest of the flock may not be infected. Labored breathing, wheezing, rattling in the throat, gaping and sneezing are symptoms to be looked for. The bird showing these symptoms should be treated at once with one of the following mixtures: Zenoleum and kerosene, equal parts; sweet oil and kerosene, equal; or chloroform, one part, and cotton-seed oil, three parts. The head of the chicken should be immersed in the mixture for a moment or a small amount of the mixture should be injected through the nostrils and mouth. This should be supplemented with the tonic already recommended, or with epsom salts in moist mash—one teaspoonful to each bird. The bird should then be kept in dry quarters and fed bread soaked in milk, and cabbage leaves.

If the roup develops, with a fetid odor, infected birds should be killed and burned, and all birds and chicken houses should be thoroughly disinfected.

SIMPLE FATTENING GRATE

The simplest way of fattening chickens is to place them in a crate six feet long, sixteen inches wide and eighteen inches high. The bottom, back and top are slatted lengthwise and in front the slats are placed upright. On the bottom they are an inch and a quarter apart and one the back, top and front two inches apart. The slats are seven eighths of an inch

7A

thick. The crate is divided into three compartments and each one opens up separately by a hinged top. A trough for feed is placed on strips in front. The crate is strengthened by having slats there-quarters of an inch thick and an inch and a half wide in each corner of the crate, running lengthwise. The ends and the partition can also be made of solid wood in order to strengthen the crate. Ordinary inch mess wire nailed to the bottom of the crate will answer the purpose of a floor better than a slat bottom, as there will be less accumulation of droppings, therefore making the crate more sanitary.

IT PAYS TO FINISH POULTRY

Even with the present high price of feed no one can afford to sell birds and especially cockerels, in a thin condition. The good prices received for poultry meat more than pay for the extra feed, and if there ever was a time when birds should be finished, it is now.

As a war measure, the marketing of thin chickens should be prohibited. The most expensive part of the bird to produce and that, which is of the least value for food is the frame. The cheapest weight for the feed fed is the flesh as it is all edible, the necessity of putting this flesh on is evident.

The most profitable weight at which to finish cockerels is when they weigh about 4 pounds, but even earlier birds may be fed with profit, as several experiments conducted at the Experimental Farm this summer go to prove.

Poultry meat of all kinds has been a good price. Hens have been selling as high as roasters and broilers have paid well. Leghorn cockerels at the Experimental Farm have been sold at about 2 pounds each, and because of being specially finished on milk, brought good returns and paid well for extra feed. Four different lots marketed in August, 152 birds, weighed 280 pounds, they were fed for about ten days during which time they gained 60 pounds, weighing at the end of the feeding period 340 pounds. They consumed 180 pounds of mash and 24 gallons of buttermilk. The mash was composed of 2 parts cornmeal, 1 part middlings, and 1 part buckwheat screenings.

The cost of feed was 180 lbs. at 4c. per lb., $7.20, and 24 gallons milk at 5c. per gal., $1.20, making a total of $8.40 for feed and milk. Add to this the value of the birds at the start 280 lbs. of thin chickens that would bring 35c. per lb., $98, and it makes a total cost for thin chickens and feed of $116.40.

The weight of the finished chicks was 340 lbs., having gained 60 lbs. in the 10 days' feeding. The value per lb. was increased because of the quality of the flesh to 50c. per lb., making the total value of the birds, $170.

This meant a revenue of $54 for the care of 152 birds for less than two weeks. It also showed that for every pound increase on the birds it took 3 lbs. of mash and 4 lbs. of milk or an average cost of 14c per lb. of gain.—Experimental Farm Note.

DESTROY THE VERMIN

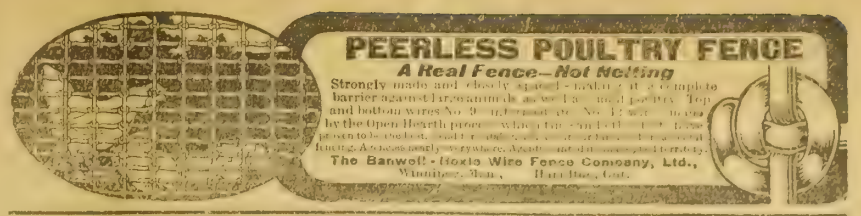
Cornell (Lawry) powder, made with gasoline, crude carbolic acid and plaster of Paris, is effective in controlling body lice on poultry. The insecticide is made by mixing three parts of gasoline and one part of crude carbolic acid with as much plaster of Paris as the liquids will moisten. Allow the powder to dry before it is used. If kept in an air-tight container, it retains its strength for a long time. It must be kept away from fire.

Infested fowls should be thoroughly dusted, especially about the vent, in the fluff, and under the wings. About a pound of the mixture is needed to dust 10 mature fowls. Gloves should be worn during the dusting process as the powder may injure the skin.

This powder is not as effective in combating head lice on poultry, and is not recommended for mites and fleas. The body lice are small, wingless, chewing insects commonly found among feathers. They eat bits of feathers, scales of the skin and dried blood resulting from wounds, but do not puncture the skin and suck blood as the mites do. They may, by constantly biting at the skin, cause severe irritation.

FATTENING FOWLS

In fattening poultry they should be confined in a small pen or crate. Exercise produces hard muscles which means tough meat whiel non-exercise leads to a softness of the muscles which are tender when cooked. Soft feed should be fed as a lack of exercise interferes with the proper digestion of whole grain. The feed should



be finely ground and mixed with water, milk or buttermilk. The following proportions have been found very satisfactory:—½ finely ground corn, ¼ shorts and ¼ ground oats. Use the foods that are reasonable in price. Corn is rich in fat forming elements, but barley and good plump oats can form a larger part of the ration where they can be secured cheaper. The fattening period should last not over two weeks, if continued longer there will be a loss of vigor in fowls without exercise. This fattening will increase the weight considerably as well as improve the quality. Roosters not to be carried over and the poor layers should be culled out and fattened. Put them in the fattening pen.—N. D. Agricultural College.

EARLY PULLETS FOR WINTER EGGS

When we take into consideration that the average egg production on the Canadian farm is 75 or 80 eggs per hen, and when well-managed flocks average 120 to 180 eggs and individual hens even go higher than 300 eggs in the 12 months, it looks as though improvement might be made in the class of stock many keep. In the first place, pure-bred stock is best. They should be from a good laying strain. They should be from good healthy parentage, and for Winter egg production pullets only and early pullets should be kept. In an experiment conducted at one of the Branch Experimental Farms where four different ages of birds were in competition for Winter egg production, it was found that early pullets produced eggs at an average cost of 16.7 cents, late pullets 28.2 cents, two-year-old hens 95.1 cents, three-year-old hens $8.76 per dozen. Figures somewhat similar to these could be procured in larger numbers. The early pullet is the only bird that should be kept for Winter egg production, and it is the Winter eggs that pay. A dozen eggs at Christmas are worth two or three dozens in May or June. Early pullets mean early eggs and early chicks in the Spring, which, of course, means early pullets in the Fall. As a rule, the pullets that lay earliest are the best layers, so that every pullet that lays before Christmas should be marked. They are your best layers.

If you are killing off year-old hens, do not kill hens that moult late in the Fall. They are your best layers, and with your best layers should always be mated male birds from good layers. The male is more than half the flock. A male from a good laying strain, and especially from a goo dlaying mother, will do more to build up the laying quality of the flock than any other one thing. Don't use, then, for breeding purposes cockerels whose pedigree you know nothing about. Better pay a good price and get a good bird.

FEED SPROUTED OATS TO POULTRY

The poultry raiser who has not yet adopted sprouted oats as a part of the hen's bill of fare, especially during the Winter months, is not only depriving his hens of feed that would be relished and which is most valuable in feeding for egg production, but is also overlooking one of his best opportunities to save on the cost of feeding. Town folks who keep only small flocks have been quicker to eralize the advantages of feeding sprouted oats than have farmers, yet the latter are the ones who should be first to understand the food value and the results that might reasonably be expected from sprouted oats, ecause the oats sprouter is to the poultryman what the silo is to the dairyman. A few poultry raisers operate their oats sprouters the year around, having found sprouted oats to be an excellent feed for both laying hens and growing stock. This can be done very profitably when the chickens do not have free range, but is not necessary with the farm flock during that part of the year when there is plenty of natural green feed. The real advantage in feeding sprouted oats is that it provides succulent green feed when none other is available. In the sprouted form, none of the grain is lost or wasted. The hens eat all the tender green sprouts, roots and soft hulls. Every poultry raiser should add an oats sprouter to his equipment. It is just another one of those things that is needed in order to make the poultry equipment complete. It means only a small investment, but large returns.

THE DUST BATH

Folks of the old generation were more appreciative of the benefits of the dust bath than are the poultry keepers of to-day. I can remember when every farm woman, who had fowls for pin money, saw to it that a dust bath was provided in the poultry house. In this the old folks showed their wisdom. Fowls cleanse themselves of insects and dirt by dusting their feathers and then shaking off the dirt and the pests with the dust. The dust bath is, therefore, to the hen what the washtub is to the individual, to say nothing of the fast that she gets good exercise in the operation. Everyone who has ever set a hen knows that she comes off the nest regularly to dust, if she has an opportunity. Instinct teaches her that lice are the worst possible enemies of young chicks and in dusting she is taking the best method of getting rid of them.

We have found that sifted ashes, or clean road dust is just about the best thing possible for poultry to wallow in. The dust bath may be boxed off in a corner of the poultry house, but preferably it should be where the sun shines directly on it, thus making it an inviting spot for the hens in cold weather. —B. W. A.

GOOD WAY TO FATTEN CHICKENS

The most satisfactory method of finishing chickens for market is to confine them to small crates where exercies will eb restricted, and to fed heavily for 10 days or two weeks on a wet sloppy mash made with milk.

The advantages of the crate method of feeding over all other methods are that it is more sanitary, the fowls are more easily controlled, feeding is easier and greater gains are secured. In addition it is easier to avoid disease since every chicken fed is under individual observation.

EGG-EATING HENS

I have 20 hens, and they have a very large range to run in. But they lay soft-shelled eggs and eat them. What should I do with them. N. S.

These hens probably need more lime than they are getting in their food, and this lack may be supplied by giving them crushed oyster shells, as they are sold by all dealers in poultry foods, or, perhaps, old plaster, if oyster shells are not available.

WOMEN'S INSTITUTE SECTION

This section of the Maritime Farmer will be devoted to the interests of the Women's Institutes of New Brunswick. We respectfully solicit contributions from all branches, touching upon matters of general interest. We wish the members of all branches of the Women's Institute to feel that the Maritime Farmer wishes to fully assist them. The Maritime Farmer is the official organ of the Women's Institute of New Brunswick. We would suggest that YOUR BRANCH name a press committee, so that news from YOUR BRANCH may reach other branches.

EFFICIENCY!

Efficiency, the magic word
Which should hold dominating sway
On pulsing industry to-day,
If LOYALTY can be averred!

Our nation's honor will be blurred
If petty differences delay
Efficiency!

O may our hearts be keenly stirred
To sense that lurking dangers may
O'erwhelm us if we disobey
The dictates of that magic word,
Efficiency!

Caroline Louise Sumner.

A FOUR FOOTED SECRET

By Mary Talbot Campbell

Ann Brownlee's fingers underscored her meaning upon shrinking shoulders:

"Mark my words, William! If I catch that pest in the house again, chewing things, or digging up the lawn, it's good-by pup. That day will be his last!"

Billie wilted under the dreaded "William," promising the impossible, as troubled eyes sought his quiet father. These two understood each other and know when to seek shelter from the peace-wrecking havoc of her tornado-like temper. When left together, John Brownlee rallied the boy:

"Take a brace, Billie! It's all in the game. Mother never was a boy; never had a dog. Beats all how she catches, throws and runs like a kid! But we men are eternally up against this thing of woman's indoor rights, you know. Guess it's our job to try the President's policy of watchful waiting. Mother means business about the pup."

"Aw! what's the use? Happy'd have to be a deader, stuffed with glass eyes, on a wooden platform under a show case to suit Mother. Looks like I'd got to give him to Fatty Short. His mother's dippy 'bout dogs."

"Cut it out, my boy! A grouch never got anyone anywhere. Men don't ditch a friend at the first hint of trouble: Not much! They stick to the finish. This is a tug of war, with us three fellows against one determined little woman; but she's a housekeeper so we've got to pull together and pull hard. Perhaps the pup's teething, so he's got to gnaw and claw at something. Ever try my kid trick of giving a dog lockjaw with sticky, half-pulled molasss candy?"

Billie chuckled in anticipation but denied ever having done it.

"Just give him more'n he can chew, Dad?"

Wrap it round and round Hap's muzzle and he won't chew anything for a while. But don't neglect to run his legs off in the open at least twice a day. In between tramps we'll try staking the pup out, though it's some like tethering a mosquito that's pestering Mother—that is, we'll do it if there's a chain light enough to hold without hurting your scrap of a dog."

"They'll kid us, Dad! He's so little, not bigger'n a minute."

A good dog's worth some bad jokes. But better get busy filling up those graves he's dug in the yard, before Mother plants him in the deepest one, without waiting for more evidence. No doubt at all but you've got the latest model, perpetual motion, double-back-action dirt-flinger on the market. I'd back him against a dredge to dig a ditch. Trot now! I'll get Mother to show me her new dress."

Grinning his thanks, the boy slammed his way out of the house. Soon Happy had the disagreeable experience of feeling his pert, protesting nose jammed roughly into dirt of his own upturning, while blows instead of caresses fell to his lot.

"Grave digger! Your! own, too. Bad dog! Do you want to be planted, Happy? Cut it out, can't you?"

With beaverish activity, Billie labored to remedy the mischief, while the mystified pup sat in head-tilted meditation at a safe distance, trying to figure it out. A startling big sneeze from such an atom of being cleared the culprit's nostrils, though not his brain; but when Billie laughted at the scattering explosion, the puzzled pup understood. It was one of those two-legged, practical jokes, of course. Politely conceding a waggish appreciation to the far-fetched jest, Happy risked more doubtful humor by accepting a whistled invitation to a tramp.

Reaching the suburban railroad track, a short run from the house, Billie balanced on one toe upon the rail, while the perpetual-motion pup renewed a frantic scartching in a favorite spot of his between the ties. The boy idly watched the dirt fly, unmindful of the fact that the canine mind cannot discriminate between places proper and improper for digging.

It was the day before Christmas and Anne Brownlee came in glowing after a game of snowball with Billie, ending with a race around the block, in which the boy won by just a neck. Tall and lithe, the roses of exercise in her cheeks, she looked little older than the dark-eyed girl John Brownlee had married. The boy panted disconnected phrases:

"Gee, Dad!—Just skinned through! —She's some sprinter!"

"You can bet your bottom dollar on that! Didn't I stake all I had on her being a winner after she nearly made her get-away, long before either of us dreamed you'd be in the running? Your dad's been broken-winded for years trying to keep up with Mother. No doubt at all, Anne, but a bully fine boy was spoiled in the making of you."

"Poor youngster! But what would our boy have done for a mother without me?"

"The conceit of her, Billie! As if I couldn't capture another mother for you!"

"Not on your life, Dad! There ain't nobody but Mother could of had me! Mother's the best ever, 'cept not liking dogs."

Avoiding the discussion of her one maternal failing, Anne Brownlee with playful mystery opened a square box and stood transfixed with surprise. From its nest of tissue paper, she took hand. Finger tips stroked the lustrous plumage of a blue bird, brooding on the brim, as she faced her husband with her fresh-colored smile.

"John! an imported creation for me? And all in such perfect taste! What artist helped you in the clever selection? You dear old thing! Did they hold you up on the price? Poor boy, it looks deliciously expensive! Where did you get it? But, Billie, tell me, is it becoming?"

"Aw! you know you're a peach in it, but no usep kiddin', Mother, for you can't fool me! Don't I know who went with him? You're the hold-up on this job. But where do I come in if Dad's dead broke?"

"You, Billie? You surprise me! Your memory is certainly the thing you forget with. Some boy said to me, 'Mother, if you'll only let me keep Happy, I'll make him do for Thanksgiving, Christmas and New Year's.'"

The boy sobered, but stood his ground.

"Well? Who's crawfishing? He does do! Can't you take a jolly?"

But it provokes me to have your Christmas spoiled by that pup! He's a hopeless torment, impossible to train. Wouldn't you rather get the dog a good home than have him killed, after being caught, red-pawed, or trying to eat the telltale proof of his guilt? Happy's a great name for a poor little puppy prisoner, with death hanging over him at his first break for liberty! Come, be sensible, Billie. Mrs. Short says she'll gladly keep him, if you'll consent to give the pup to Fatty for Christmas. So it's what you call a 'corking' boy's Christmas, with your dreams come true, and a cat thrown in for good measure, or nothing but that pesky, yellow peril! Take your choice—but if you choose right, you and I go shopping together to-night, after another hold-up."

The boy's eyes flashed to his father, heart loyalty aflame, his words charged with explosive vehemence.

"Cats! Not much, Mother! Happy's got any other Christmas beat a mile! And he's growing out of prison faster'n he can dig out!"

Over Billie's head the parents telegraphed their amusement.

When Anne Brownlee left the room to add her hat to the growing display of presents in the parlor, the father was assailed by a whispered petition which proved too much for the elongated boy within him.

"Just for to-night! It's Christmas Eve! I'll scrub him with ivory soap and dope him with bay rum and he's all the Christmas I've got! On the square, Dad, didn't you never sneak off and sleep with a dog?"

John Brownlee cleared his throat and made an honest confession.

Sure thing. But Christmas Eve would be a fake without secrets, so here goes. Men are big bluffs, just kids playing the grown-up game. You came along and pushed me into the part, but I'll make my get-away to-night and help you commit the crime. Better be sure that your room door is shut tighter'n sticking plaster, or the plot will thicken to the danger point for Happy. We'll take no chances on Providence mothering us kids. There's another mother liable to take a hand in this. She's got nerves and dogs get on them. I've got to see that Anne doesn't—isn't—disturbed to-night. Understand? She's a light sleeper and I won't have her losing any rest—over—over possibilities. But with all the help I can give you, Billie, we're taking big chances, for if that four-footed secret gets out, he's a goner."

"I should worry if he gets out through me! But say, Dad, you're a corking good kid! I wish we'd got a even start. But I might of drew a bum father that way."

"Impossible. Mother's a dandy at picking them out."

"I thought the man always picked."

"Think again, Billie, before you're big. 'Propinquity is the splice of life,' they say. That means that by the time your turn comes, if the Great Potter has turned out another masterpiece like Mother, you just stick around handy so's to make it easy for her."

"Aw! I'd rather skin out. But say, I'm busting to tell somebody 'bout to-night—and Happy's dead safe."

Billie was off to confide the overwhelming delight to a bewildered doggie, whose ear twitched to the tickling breath of the great secret.

So it came to pass that through some thrilling smuggling by the conspirators, a sleek, yellow head of minute proportions, was snuggled close to Billie's brown one, after a great battle on the tented field of the bed, where utter weariness conquered at last.

Unconscious of the insurrection in her family, Anne Brownlee busied herself with a generous pair of stockings for unsuspecting Billie.

Happy was first to awaken on Christmas morning. After futile efforts to arouse Billie, he began an excited trip of discovery through the forbidden indoor world. In padded cau-

ROYAL YEAST

Has been Canada's favorite yeast for over a quarter of a century. Bread baked with Royal Yeast will keep fresh and moist longer than that made with any other, so that a full week's supply can easily be made at one baking, and the last loaf will be just as good as the first.

Advertise in the Farmer

tion, punctuated by the click of claws on uncarpeted spaces, the puppy reached the door, left accommodatingly open by an unexpected Santa Claus. Pausing to nose a bulging pair of boyless legs, hanging from the knob, Happy slimmed through the crack, tap-tapping down the polished stairs and into the parlor Eden, from which he had been excluded.

Too late, Billie opened sleepy eyes to the drowsy joy of his lumpy stockings, but was fully awakened into blinding terror by the sound of a happy rumpus in the room below. A white-shirted, shivering figure crept stealthily out of the door, without giving a single questioning squeeze to the enticing joys dangling there.

Happy welcomed him noisily, between pawing efforts to rid his nose of annoying blue feathers. Billie captured the pup, smothering his protesting whines in the caught-up folds of his nightshirt. Cold, barelegged and chilled at heart, a youngster with anguished eyes regained his room.

The culprit was buried beneath the weight of bedding, while shaking fingers struggled with Billie's rebellious clothes. An excited upheaval rippled the counterpane, making for the edge of the bed; but a shivering hand thrust the minute, warm body back again, as it burst, bright-eyed and triumphant, from the restraining covers.

Billies's world had come to an end. He dared not dream of the doom awaiting Happy in the clutch of his mother's just rage. No, it was death for one or flight for both, though the boy knew himself blameless for the open door, which he had so carefully shut. But there was no faltering—though a fellow would like to say goodby to his father. One thing was sure, he would die, too, before Dad should catch it through him.

Dumb as the dog, Billie grabbed his cap and gripped Happy to him, circling the inquisitive nose with thumb and finger, to prevent telltale questioning from giving the alarm. The stairs creaked menacingly and the boy's underlip ached from the pressure of his teeth. Happy Clawed angrily at the clamping fingers, wriggling with all his slender might to be free.

At sound of movement in the kitchen, the runaway's breath stopped, the added weight on his chest crushing out hope. The stairs moaned as in sympathy and a voice called:

"Merry Christmas! Trying to get ahead of your mother, Billie?"

"N-no!" chattered the boy, his heart racking his body with its throbbing. A laugh and hurrying steps answered him:

"Oh! no, I suppose not. But why this creeping about?"

His mother stood at the foot of the stairs, lifting an amused smile of welcome, but the escaping criminal was silent.

"Did Santa Claus know what a boy about your size would like, Billie?" she persisted.

"You bet!" almost sobbed the child, for she blocked the narrow way to life and liberty.

"What ails the boy!"

Mrs. Brownlee peered up the shadowy stairway; Billie sniffed.

"Ain't something burning, Mother?"

But this duplicity stirred suspicion, for she had not started breakfast. Running up three steps for a nearer view of guilty Billie, Anne Brownlee discovered that the boy was terror-stricken and trying to shelter his four-footed companion in sin. Instinctively she turned to the parlor and her new hat.

There was a scurrying rush of stumbling feet and a pup's yelp of pain, as the fugitives were jammed against the door in making their escape. Billie's rough little coat slipped from his mother's clutching fingers and the race was on, as John Brownlee cursing his own folly, came to the head of the stairs.

Out of the back door, over the Christmas earth, through light drifts of new-fallen snow and wind-swept spaces of cleared ground, Billie ran for his dog's life. A great love abolished selfish fear, while the mothr's piercing cries penetrated more sharply than terror or cold. His devotion to her shrank achingly from this one ugly phase of her nature. With numb longing, he thought of his father, but when the man's clear shout rang out:

"Billie! Stop!"—the child's heart forced his eyes backward, sorry to disobey, though swift feet never slackened. A half-buried stick, unseen during this incident, tripped him, causing an unconscious reaching for balance, and Happy leaped into space. Fear-frozen, Billie's whistle failed him, but a hoarse:

"Hre Hap—Hap—Yappy!" rose in strangled pleading, as crouching and straightening by turns, the child struggled to regain possession of the pup, as the hunters drew near. But, no! The tiny yellow spot paused a heart-beat, wavering like a shadow on the snow, but at sight of the pursuing woman's face, drew itself out into a streak of maddened flight straight ahead. Goaded by a sharp access of terror, the boy plunged after.

"All my fault! Go home, Anne!" admonished her husband as he passed her, "I'll tend to this."

But she was deaf to reason, though Billie, breathing in sobbing gasps, feared her no more, his heart engulfed by a new despair. The rumble of the suburban rocked the earth with its stupendous approach and he saw the sunshine of life streaking straight for the track. An agonized cry of concentrated prayer shrilled out:

"Father!"

The man heard, throat stung by his boy's pain, sick with his own helplessness. With smarting eyes he followed the blur of the dog's lithe bit of body, shot by fright into the jaws of death. With breathless shouts, he strove to divert the pup's attention, to swerve his course; but Happy, hugging the ground, sped on, deaf to the cries of love and warning. The panic of following Fate was greater than anything which might be ahead.

The mother, clutched by an overwhelming revulsion of feeling, breathed the great name indwelling with us all, pitying eyes traveling between boy and dog, as her tiny enemy raced down the roadbed of the suburban, with the train in hot pursuit.

Life centered in wee Happy; death in the onrushing demon with ghostly breath. The pound, pound, pound of his own heart, the blood surge of desperation, and the grinding crush of gigantic driving-wheels ravaged Billie's world. Anguished eyes never left a flash of yellow, sunning along between the shining rails, just ahead of destruction; but when the grim avenger, in sinous black gained, devoured the life span between and thundered over Happy, Billie went blind, hands outflung piteously as he lived on with a broken heart.

Racked by remorse, the mother promised another dog, yearning arms opened to a dry-eyed boy; but with his last bit of strength, the child, white and reeling, turned from her, to be caught by his father.

Laying Billie on the bare ground, with snow on his forehead, John reached the silent comfort of a strong hand to his suffering wife, speech eluding him. But she too, turned away, moving slowly up the railroad embankment, goaded by her guilt to self-inflicted torture. She paused to tread out of sight in a snowdrift, the vivid blue of a wind-tossed feather, frighted with useless regrets.

"Anne! come back to Billie. The little shaver needs his mother. We've got to make it up to him."

A lifeless voice replied:

"Billie doesn't want me and I don't deserve him."

"Anne, I'm the bloody villian! I tell you it was all my fault. Go home, do. Billie'll need something hot. I'll tend to everything.

Saturated with wretchedness, she gave no heed. Why couldn't another train obliterate the ache and blunder of it all? The mother made a forlorn courage to look down.

Shrinking, Anne Brownlee bowed her head; forced snow-dazzled eyes to open on the shining track.

A pulsing blotch of color, distorted by her tears—the faintest whimper—and the mother crumpled down upon the rail, laughing with broken pathos. Fingers bungled in their haste over a cringing, wildly palpitating pup, snatched to her heart at last, from the depths of the life-saving hole which Happy himself had dug between the ties. Safe, but in a deafened dread, the throbbing mite had cowered, unharmed, while the monster destroyer overleaped his prey.

A-whirl with feeling and delirious speech, sobbingly glad, she cuddled the puppy-prodigal in the curve of her neck, his astonished little body sprawling over the tumult of her bosom. The reconciled pair half-rolled down the embankment in the mother's impetuous rush of restoration.

When the caress of a loving tongue washed Billie's face with lapping affection, and pathetic whines called to

TOOK SEVERE COLD
SETTLED ON CHEST.
Bad Cough for Weeks.

The cold starts with a little running of the nose, the head becomes stuffed up, but little attention is paid to it, thinking perhaps it will go away in a day or two.

You neglect it, and then it gets down into the throat and from there to the lungs, and it is a case of cough, cough, morning, noon and night.

However slight a cold you have you should never neglect it. In all possibility, if you do not treat it in time, it will develop into bronchitis, pneumonia, or some other serious throat or lung trouble.

Dr. Wood's Norway Pine Syrup is a universal remedy for those who suffer from any bronchial trouble. It stimulates the weakened bronchial organs, soothes and heals the irritated parts, loosens the phlegm and mucous, and aids nature to clear away the morbid accumulations.

Mrs. Wm. Kaye, Talmage, Sask., writes:—"Last winter I took a severe cold which settled on my chest. I had a bad cough for weeks. I got some medicine from our doctor but it did me no good. At last a friend advised me to try Dr. Wood's Norway Pine Syrup, which I did, and after using one bottle I found that my cold was better. I have recommended it to my neighbors, and they say they would not be without it."

Dr. Wood's Norway Pine Syrup is for sale by all dealers. Price 25c. and 50c. a bottle.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

Windsor, Ont.

"ALL IN" AS HE THOUGHT

Could Not Work or Walk Any Distance.

The efforts put forth to keep up to the modern "high pressure" mode of life in this age soon wears out the strongest system, shatters the nerves and weakens the heart. The strain of business, the cares of home and social life, cause terrible suffering from heart and nerve troubles.

The strain on the system causes palpitation of the heart, faint and dizzy spells, smothering and sinking spells, shortness of breath, etc.

The reconstructive power of Milburn's Heart and Nerve Pills is simply marvellous, and those whose health standard is below par, will find a course of them will soon recuperate their health and get back their mental and bodily vigor.

Mr. Oscar Tracy, Postmaster, Tracy Station, N.B., writes:—"Two years ago I was 'all in' as I thought; could not do any work, nor walk any distance. I had taken no medicine, but tried your Milburn's Heart and Nerve Pills, and found such benefit from the first box that I continued taking them. I am sixty years of age, am able to work every day, and feel fine now."

Milburn's Heart and Nerve Pills are 50c. a box at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

silhouette against the Christmas sky as she raked together her shattered him, the magic of touch and tone opened grieved young eyes. Anne Brownlee, adrift between laughter and tears, knelt close, indiscriminately kissing either or both in her exhilaration. Blissful whisperings brought Billie's arm to a strangled hold about her neck, while through the waters of gladness, the father saw a fresh flowering of motherhood.

NEW BRUNSWICK's FIRST WOMEN'S INSTITUTE STILL GOING STRONG

Editor Maritime Farmer,
Sussex, N. B.

Dear Sir:—

As the "Maritime Farmer" has been made the official organ of the Women's Institutes of New Brunswick, and a section of the paper has been opened to contributions from the various branches, I will ask you to kindly publish in your next issue a short report from our branch, Andover, N. B. The first Women's Institute branch in New Brunswick was organized at Andover on June 12, 1911, with Mrs. J. E. Porter president.

The interest has been sustained and the attendance fairly good through all the succeeding years. The October meeting was not held, owing to the ban on public meetings during the prevalence of the influenza. Our November meeting was held at the home of Mrs. W. A. Gillett, Andover, who has kindly opened her home, which is centrally located, to the members for meetings during the winter. The president, Mrs. D. W. Pickett, occupied the chair and, during the meeting, gave an interesting account of the Provincial Convention, Fredericton, which she had attended as delegate. Correspondence was read by Mrs. C. H. Spike, Secretary soliciting help for different objects. On motion it was decided that each member contribute a chicken, boxes to be shipped before Christmas to Jordan Memorial Sanitorium and Soldiers Convalescent Home, Fredericton.

A programme committee appointed each meeting provides for the program for next meeting, and a refreshment committee supplies the eats.

I will not make this report any longer as I hope to call on you for space in the future, and hope to have more interesting reports to follow.

Sincerely Yours,
JENNIE B. MANZER,
Press Correspondent.

Nov. 29, 1918.

"I Had Rheumatism But Now I Haven't"

WHY PETER R. SHIRMAN RECOMMENDS DODD'S KIDNEY PILLS

Manitoba Man Tells How His Troubles Vanished When He Used the Old Canadian Kidney Remedy, Dodd's Kidney Pills.

Ethelbert, Man., Dec. 13th. (Special.)—"I had rheumatism, and now I haven't." That is the reason in a nut-shell why Peter R. Shirman, a well known resident here, is singing the praises of Dodd's Kidney Pills.

"I could not work, but now I am strong," Mr. Shirman continues. "That is why i think Dodd's Kidney Pills are the best of all remedies."

Asked as to the symptoms that troubled him during the early stages of his illness, Mr. Shirman said:

"I caught cold a year ago. I was troubled with stiffness of the joints and headaches, and my sleep was broken and unrefreshing. I was always tired and nervous, and my skin had a dry, harsh feeling. I was often dizzy, and I had a bitter taste in my mouth, especially in the morning.

"Finally rheumatism and lumbago and Bright's Disease set in. Then I decided to try Dodd's Kidney Pills. They made me well."

If you haven't used Dodd's Kidney Pills, ask your neighbors about them.

HINTS FOR THE SEWING ROOM

Try and save your dressmaker's time when she works at your home. Have the sewing machine cleaned and oiled. Run it on some waste material to throw off the excess of oil. Thread several bobbins with the needed thread. Have pins, needles and sheers handy, also empty table for cutting.

Be sure the ironing board is padded and that it has a clean cover. If garments are to be made over, have them ripped, cleaned and pressed. See that you have plenty of pins, and that they are very fine, for, by using slender, extra sharp pins, you mark the fabric less.

When you work on black or dark cloth wear a white apron. The reflected light will be of help. Save all salvages of georgette crepe, chiffon or fancy fine weaves. You can make a novel and attractive finish by applying them on the material in the original cutting.

Always sew the buttonholes together before washing a sweater or in anything in which buttonholes are liable to stretch.

THE INSIDE MARK OF THE GENUINE

The young girl buyer was quite inexeprienced in the matter of panama hats.

"See," said the saleslady, "you can always tell a geuine panama by looking inside. See how smooth the inside of the crown is in the imitation and how different the finish is in the genuine."

And even so, does it take only a look within our lives by those beside us to tell whether we are the genuine creation God meant us to be or whether we are only attractive imitations or His best work. We may wear the most stylish clothes of the store windows, we may cultivate nice manners and accent, but until we have in our hearts, noble and unselfish ideals, until we are living for something good and great, until we are trying to make our lives a copy of the Life Beautiful, then only will those who look within us see that we are the genuine article that our Maker intended us to be.

AVOID RUSTY NEEDLES

Rusty needles and pins are dangerous when they are thrown around carelessly, or left sticking in the wall paper or on the arms of upholstered chairs. Many people of all ages have lost their lives through the prick of a pin or needle which introduced poison into the ir blood. Germ life is everywhere, and even if the needles and pins are new and shiny, there is danger, as the infection may come from contact with disease on the hands, furniture, window sills and a thousand and one other places.

To be on the safe side, all rusty pins and needles should be carefully disposed of and not left around the house or grounds. Prevention is better than cure, every time.

Belgium Starving

Under Allied Flags

Immediate Help Needed to Relieve Starvation and Suffering—Cannot Hold Germany Responsible NOW!

There is pressing need for our help in Belgium today, and there will be for many months to come.

As our troops occupy the evacuated territory, untold misery stares them in the face. Emaciated children, hollow-cheeked women, roofless homes, clothing so worn it offers no protection from winter's terrors—miseries that cannot wait but MUST be relieved at once to avert DEATH!

Need you be reminded how Belgium was the first to jump into the breach and so make our Victorious Peace possible?

Don't let it be said WE let Belgium starve. Let us cable over your offering to the mothers and children of Brave Little Belgium AT ONCE!

Make cheques payable and send contributions to

Belgian Relief Fund

(Registered under the War Charities Act) 127

to your Local Committee, or to

Headquarters: 59 St. Peter St., Montreal.

TRIFLES

The story has often been told of how a friend of Michael Angelo's once saw the great sculptor at work on one of his beautiful statues. Some time afterwards the visitor again saw the artist at work on the same figure, and observing how little aparently had been done, se said: "Have you been idle since I saw you last," "By no means," was the reply. "I have retouched this part and polished that; I have softened this feature and brought out that muscle; I have given more expression to this lip and more energy to this limb." "But," said the friend, "all these are trifles." "It may be so," replied Angelo, "but recollect that trifles make perfection, and that perfection is no trifle."

GGLESS WHITE CAKE

1 cupful granulated sugar, 2 scant tablespoons shortening, 2/3 cupful of sweet milk, 1½ cupfuls flower, 1 heaping teaspoonful baking powder.

Cream sugar and shortening. Add milk, sift flour and baking powder, and beat hard for several minutes. We find a cheap cake, well beaten and mixed, will be very good. Bake this in a long dripping pan. If desired, cover with the following frosting:

Cook until a soft ball is formed when tested in cold water. Remove from fire, stir until it begins to thicken, then cover cake.

CURED HIS RUPTURE

I was badly ruptured while lifting a trunk several years ago. Doctors said my only hope of cure was an operation. Trusses did me no good. Finally I got hold of something that quickly and completely cured me. Years have passed and the rupture has never returned, although I am doing hard work as a carpenter. There was no operation, no lost time, no trouble. I have nothing to sell, but will give full information about how you may find a complete cure without operation. if you write to me, Eugene M. Pullen, Carpenter, 5543 Marcellus Avenue, Manasquan, N. J. Better cut out this notice and show it to any others who are ruptured—you may save a life or at least stop the misery of rupture and the worry and danger of an operation.

MINARD'S
"KING OF PAIN"

Manufactured by the
Minard's Liniment
Yarmouth, N.S.

ONE-CRUST APPLE PIE

Prepare crust and line pie tins. Cover thickly with flour, then with granulated sugar. Next place your apples that have been pared, cored, halved. Lastly sprinkle again with sugar and cinnamon, and a dot or two of butter.

Add just enough water to dissolve sugar and flour. The amount of water varies according to the kind of apples that are used, as some are more juicy than others. Bake until crust is brown and apples thoroughly cooked.

Our family prefers this to a double-crust applie pie. It not only is less labor to make but saves one-half the lard.

MILKLESS, EGGLESS, BUTTERLESS CAKE

A milkless, eggless, butterless cake which is very good for school lunches and for suppers is made as follows:

Put in saucepan the fololwing: 1 cupful water, 1 cupful brown sugar, 1/1 cupful lard, pinch of salt, 2 cupfuls of raisins, 1 teaspoonful each of nutmeg and cinnamon.

Boil together for three minutes and remove from fire. When cold add 1 teaspoonful of soda, dissolved in a little hot water, 2 cupfuls of flour, ½ teaspoonful of baking powder. Bake in slow oven.

MAN MUST WORK

Man must work—that is inevitable. He may work grudgingly, or he may work gratefully; he may work as a man, or he may work as a slave. He cannot choose his work, but he can go about it in a cheerful, generous temper and with an uplooking heart. There is no work so rude that he may not exalt it; there is no work so dull that he may not enliven it. But—he must work.—Exchange.

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:
Mrs. M. Summers, Box 309 Windsor, Ont.

A MESSAGE TO WOMEN!!

THE TEN COMMANDMENTS OF HEALTH

1. Be clean.
2. Swat the fly.
3. Get vaccinated.
4. Save the babies.
5. Eat clean foods.
6. Drink pure water.
7. Breathe fresh air.
8. Pasteruize the milk.
9. Report contagious diseases.
10. Avoid excesses.

APPLE PUDDING

Take a deep granite baking pan. If greased it will wash easier. Pare, core and cut in small slices good cooking apples. Fill pan two-thirds full of the apples. Sprinkle with sugar and cinnamon.

Cover with dough made as follows: Two pints of flour sifted with 2 teaspoonfuls of baking powder, 2 teaspoonfuls of sugar. Mix thoroughly with one heaping tablespoonful of lard. Pinch of salt. Add sweet milk to make dough—not too thick. Spread over the apples and bake until dough is done. This should be served warm with sweet milk or, if preferred, with a sweet sauce.

TEETH GRINDING

(By Dr. Edna C. Robertson)

Whether the season of the year may be one of the contributing factors to the practice of teeth-grinding, the writer is not prepared to say, but, in practice, during the last month or two more children have been attended or brought to the office for the above condition than for any other condition. Of course,, the mother usually attributes the cause to worms, but that has been so often found to be a mistake that we shall discuss the probable causes of the practice.

Teeth grinding is exceedingly common in childhood, and is sometimes puzzling as to its significance. It is seen or rather heard, under such very different conditions, that it is perhaps well to mention first those in which we can be certain of its exciting cause and then to consider those in which its relation to associated disorders is less dfined.

Local Irritation

Grinding of teeth occurs sometimes in the waking condition, but far more often during sleep. In one case brought to the writer's attention lately, most of the grinding apparently was done during the day. On examination, it was found that several new eteth were on the verge of coming through the gums. Relief evidently was found by the child grinding his teeth thus everting a soothing pressure on the swollen gums. This cause then, we might say was due to a local irritation. In these cases, the children are usually peevish, iritable and often have small, red spots on the cheek and chin, and, again, they usually have a great amount of saliva, and in fact, the "slobbering" conditions is, to say the least, disturbing.

Decay of Teeth

This may be one of the contributing factors also. The irritation set up by the decaying process will cause continual annoyance to the child with the result of teeth grinding for relief. Last week a child of eighteen months was brought to the office with decayed upper teeth, so badly decayed that the gums had become inflamed, and it was found necessary to extract the teeth. The mother had assured herself, in this case, that the teeth grinding, which she had noticed, had been going on for some time, was due to the condition. Two days after extraction, the habit had disappeared altogether. As to the cause of the decay of the teeth in a child so young we cannot say, except that it may hape been due to the lack of certain salts in the food of the child when it was weaned. In addition to the decay of the teeth, we may find ear trouble from the inflammation set up, and occasionally this associated with the decay may be one of the other causes.

Intestinal Disturbance

Perhaps commoner than any of these sources of irritation is disturbance in the intestines. In teeth grinding, in the majority of cases, we can almost invariably find the cause in chronic indigestion; the children are usually pale with a large abdomen, rather puffy about the eyes, constipated with stools containing mucus. Moreover, the children are usually thin and said to be wastin or losing flesh. At night, frequently their sleep is disturbed by such things as sleep-talking, waking in sleep, crying out in apparent terror. Often the children will take a knee-elbow position for sleeping instead of lying on the side or back; they lie half crouched in bed. In such cases there is invariably some digestive distrubance. Bed-wetting, too, is a common habit accompanying the same distrubed digestion, and, as the writer has proved in actual practice, many cases of bed-wetting will clear after the digestive distrubances have been overcome. Not long ago, a boy of nine years of age was brought to the office suffering from the habit. In fact, it seemed that during the day, while at school, he found it exceedingly difficult to take care of himself. The writer was asked by the mother for a note to the teacher to allow the boy to leave the room at stated intervals. This child was put on a course of treatment for digestive disturbances, which were very plain from his general appearance, and two days ago the father of the boy was interested enough to call and give the information that the cure had been complete. Very often the source of the digestive distrubances seems to be raw fruit, and especially bananas. For that fruit every child seems to be ravenous, and so very often two and three bananas (green usually) are given to satisfy the cravings of the child, who seems to be almost mad at the sight of the banana. The banana should be at least covered with brown spots, which indicate the degree of ripeness, before being given to any child, and if the writer had her way, no children would be given bananas, except when the fruit had been cooked.

Treatment of Teeth Grinding

Careful dieting with easily digested foods, with milk the main factor in the diet. As to giving a list of food suitable for all children (with exception of milk) that is impossible, for what ih "one person's meat is another person's poison." Eggs, for instance, are most valuable in the feeding of children, but some cannot take them. Some children can take the white of the egg, but not the yolk. The mother usually knows just what agrees with the child, and on what it thrives.

SYRUP

Are YOU saving Sugar by using

CROWN BRAND CORN SYRUP

Corn starch converted into its "sugar" form, with pure cane syrup added.

LILY WHITE CORN SYRUP

The Canada Food Board recommends Corn Syrup (White) for preserving and cooking. Also delicious for all table purposes.

In 2, 5, 10 and 20 lb. tins, at all dealers.

CANADA STARCH CO. LIMITED - - MONTREAL
162

FOR AN INVALID

If soup or beef tea is to be cooled at once, pour it throguh a clean, unbleached muslin cloth, which has been saturated in cold water. Not a particle of fat will be left in the beef tea.

A SEWING HINT

Hem all white and light-colored garments with number 200 white thread using a very lne stitch. It will hold and not show, and may be pulled apart easily if the garment is to be altered or remade.

Never blame the chickens if you don't get eggs. There are about 700 eggs in every hen, about 500 of which are worth going after. You'll get them if you care for the hens properly.

Another thing about chickens: In feeding for broilers or fries give them all they can eat from the time they are little chicks until the day they are sold. Keep feed always before them. It takes a certain amount of feed to produce a broiler and you can give it in a few weeks or drag it out for several months. A good idea is to push them right from start to finish, never letting them be hungry except when they get up in the morning.

LET US EAT THIS KIND OF CANDY

Bittersweets

An attractoive variety of candies may be made by dopping sweet fruits in bitter chocolate. Use for this purpose dates, citron, candied orange peel or home-preserved fruits, drained, sprinkled with sugar and dried in a slow oven. Melt unsweetened chocolate in a doubl eboiler. Keep the chocolate just warm enough to prevent solidifying. With a silver fork drop pieces of fruit into the chocolate. See that each piece is completely coated, then remove to waxed paper to harden.

Old-Fashioned Molasses Candy

Boil down molasses until it reaches the hard-crack stage. Pour on oiled plates, and cool. Oil the hands and pull portions of the candy until it becomes light colored.

Fudge Squares

½ cupful of vegetable oil, 1 cupful of molasses, 2 eggs, ½ teaspoonful of soda, 1¾ cupfuls of rye flour, ½ teaspoonful of baking powder, 1¼ teaspoonful salt, 2 squares of melted chocolate, 1 cupful of nuts, 1 teaspoonful of vanilla.

Combine the ingredients in the order given, sifting the dry ingredients together. Pour the mixture into a shallow pan. Bake it for ten or twelve minutes in a hot oven and cut it into squares while it is warm.

Pop-Corn Candy

For making pop-corn candy either honey, maple sirup, molasses, white cane sirup or corn sirup may be used instead of sugar. To one cupful of sirup allow one tablespoonful of vinegar. Boil together until the syrup hardens when dropped into cold water. Pour over freshly popped corn and mold into balls.

Chocolate Dainties

Put through the meat chopper half a cupful each of dates, figs and nut meats. Add one tablespoonful of orange peel and one square of melted unsweetened chocolate. Mold into balls and roll in chopped nuts or granulated sugar. This mixture may be packed in an oiled tin, put under a weight until firm, then cut into any shape desired.

Maple Creams

Boil one cupful of maple sugar with one cupful of water until it forms a soft ball when dropped into cold water. Remove from the fire and stir rapidly until it becomes creamy. Form into balls the size of marbles and put nut meats on each side. Lay on wax paper to cool.

CAMOUFLAGED MEAT LEFT-OVERS

Letft-over meats ma be served in many tempting ways, some of which are the following:

Cottage Pie.—Cover the bottom of a greased baking dish with hot mashed potatoes. Add a thick layer of cold cooked meat cut into bits, seasoned and moistened with some gravy. Add some minced onion also, if liked. Cover with another layer of mashed potatoes, cover with dots of butter and bake until brown on top.

Rice and Msat Casserole.—Line a buttered baking-dish with cooked rice and fill centre with chopped cold meat highly seasoned with salt, cayenne, celery salt, onion juire and lemon juire. Moisten with gravy, cover with more dooked rire, then cover the dish and steam 30 to 45 minutes. Serve on a platter, surrounded with brown gravy or tomato sauce.

Mince .on .Toast.—Chop or grind cold meat, heat with some of the gravy, season with celery satl or onion juice and serve on hot, buttered toast.

Scalloped Meat.—Into a baking dish put alternate layers of cooked macaroni or rice and chopped meat. Pour over it tomato sauce, cover with buttered crumbs and bake.

Browned Hash.—Mix together equal parts of chopped meat and chopped boiled potatoes—the meat may be raw or cooked. Moisten slightly with gravy, season and put in a frying pan containing a little fat. Cover and cook slowly. Turn on a hot platter and serve with tomato sauce.

Oxford John.—Take slices of cold mutton and brown in buter or dripping. Add 1 cup rich stock or gravy and a teaspoon of currant jelly. Season with salt, pepper, onion juice, chopped parsley and a blade of mace or dash of nutmeg. Simmer for 5 minutes and arrange on a hot platter about a mound of mashed potato, straining the gravy over all. Garnish with a spoonful of jelly.

THE REMOVAL OF GREASE SPOTS

By Absportion:

Lay the material on a flat surface with the spot between two very soft blotters and apply a warm iron. If this is not effective rub the wrong side of the spot with powdered magnesia, French. chalk, fuller's earth, corn starch or white talcum powder, brushing it off and applying a fresh supply as it becames gummy. When most of the grease has been removed a fresh supply of the absorbent may be applied and the garment hung away for a day or two. The powder should then be removed by a thorough brushing.

By Solvents:

When using a solvent great care must be taken or a ring will be left around the spot cleaned. Place a very soft white blotter or a soft clean cloth under the spot to be cleaned, changing the cloth—or blotter as it becomes

He Cannot Sleep

IT isn't the body that craves rest, but the mind.

When you are bodily tired you can usually fall to sleep at the first opportunity.

But when the nerves are irritated by anxiety and worry rest and sleep seem to be impossible.

The mind seems to be most alert, and you are thinking, thinking, thinking—first of one thing and then of another—often matters of little or no importance. But you simply cannot sleep.

Sleeplessness is the most common and often the first indication of a breaking down of the nervous system.

The object of sleep is to allow the body to rebuild tissue and the nerves to recover tone. Sleep is the ideal condition for this process.

If you cannot sleep you worry, and worry breaks down nerve cells at a tremendous rate, so that instead of laying up nerve force for the demands of the day you are using up the reserve.

The nerve centres are sometimes likened to storage batteries. If you continue to consume the nervous energy in reserve, without paying back, these centres become sooner or later depleted, and you find yourself a nervous wreck.

After a sleepless night you get up feeling tired and lacking in mental energy. Your day's work seems more than you can face, and you become down-hearted and discouraged.

The future is not bright, for you must realize that the natural result is exhausted nerves, paralysis, locomotor ataxia or some form of helplessness.

In Dr. Chase's Nerve Food is found the most natural and the most rational treatment for the nerves imaginable, because this food cure contains the vital substances which go to the building up of the blood and the depleted nerve cells.

Dr. Chase's Nerve Food does not induce sleep, but it does restore the nervous system, and after you have been using it for a few days you will begin to find yourself resting and sleeping naturally.

A little patience is necessary if your nervous system is greatly exhausted, but you will be encouraged by the benefits obtained to keep up the treatment until the exhausted nerves are fully restored, and you feel the energy and snap which means success and happiness.

Dr. Chase's Nerve Food, 50 cents a box, all dealers, or Edmanson, Bates & Co., Limited, Toronto. To protect you against imitations the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author, are on every box.

stained. Sponge the spot with a piece of cloth, like the material when possible, moisten with chloroform, carbon tetrachlorid, ether, gasoline, naptha or benzine. Keep the bottles well corked, have plenty of fresh air and do ont work near heat or a flame as most grease solvents are very inflammable.

To prevent the spreading of the grease and solvent, work with a small amount of the liquid at a time and work from the outside toward the center. The spot should be rubbed gently with a clean cloth until dry.

If the spot is surrounded by an absorbent or the absorbent and solvent made into a paste, there is less danger of the ring.

HOW ILL USE WRECKS CHAIRS

Some people are hard on furniture. Others use furniture with care. A man who sets himself down on a chair properly is a man to be trusted. He not only sits in it gently, with no crushing impactas he strikes it, but he sits in it squarely, without racking it.

On the other hand you may see a man fairly drop into a chair, let go of himself at some distance from it and drop into it with a blow that makes the chair creak and threatens to drive the seat through its frame, or at least to break the psrings. Chairs can't withstand much of that sort of usage; but there are people who seem unable to sit in a chair in any other way.

But the worst thing that can happen to a chair is to have people push back in it. Suppose we are sitting at a table and we want to back away from i tto open a drawer or something. Of course the proper thing to do is to life the chair back with our weight removed from it; but haven't you seen people push the chaor back under them along the floor?

And then hear the poor chair creak and groan in every joint with the thrust thus put upon it. Chairs were made to sit on, vertically; not to be subjected to violent oblique wrenchings and twistings. The chair was never made that would long stand such usage. Under repeated pushings back it becomes wabbly and loose jointed, a mere wreck of its once sightly, secure and satisfactory original self.

MEATLESS DAY SOUP RECIPES

Celery Soup:—

For three people, wash thoroughly a large bunch of celery. Boil until soft, after cutting it into inch pieces. Make a sauce with 1 pint of milk, a lump of butter, salt, pepper and a litte cold milk. Drain the celery from the water, put it in the sauce, boil up once, then serve.

Baked Bean Soup:—

Put 3 cups of cold baked beans, 6 cups of cold water, half an onion sliced and 1 large stalk of celery in a saucepan, bring slowly to to the boiling paoit, let simmer 20 minutes, then rub through a sieve. Cook 2 tablespoons of barley flour in 2 tablespoons of butter, add the ctrained mixture slowly, stir until thickened, add 1¾ cups of stewed and strained tomatoes, season with pepper and salt. Cook 10 minutes longer and serve with croutons.

Cream of Peas Soup:—

Cook 1 tablespoon of chopped onions in 1 tablespoon of butter, add a small piece of bay leaf and cook half an hour, then press through a sieve. Melt 2 tablespoons of butter, blend in 3 tablespoons of barley flour, add slowly 3 cups of milk and cook and stir until smooth. Combine the two mixtures, season with salt, celery salt and a dash of cayenne, and serve.

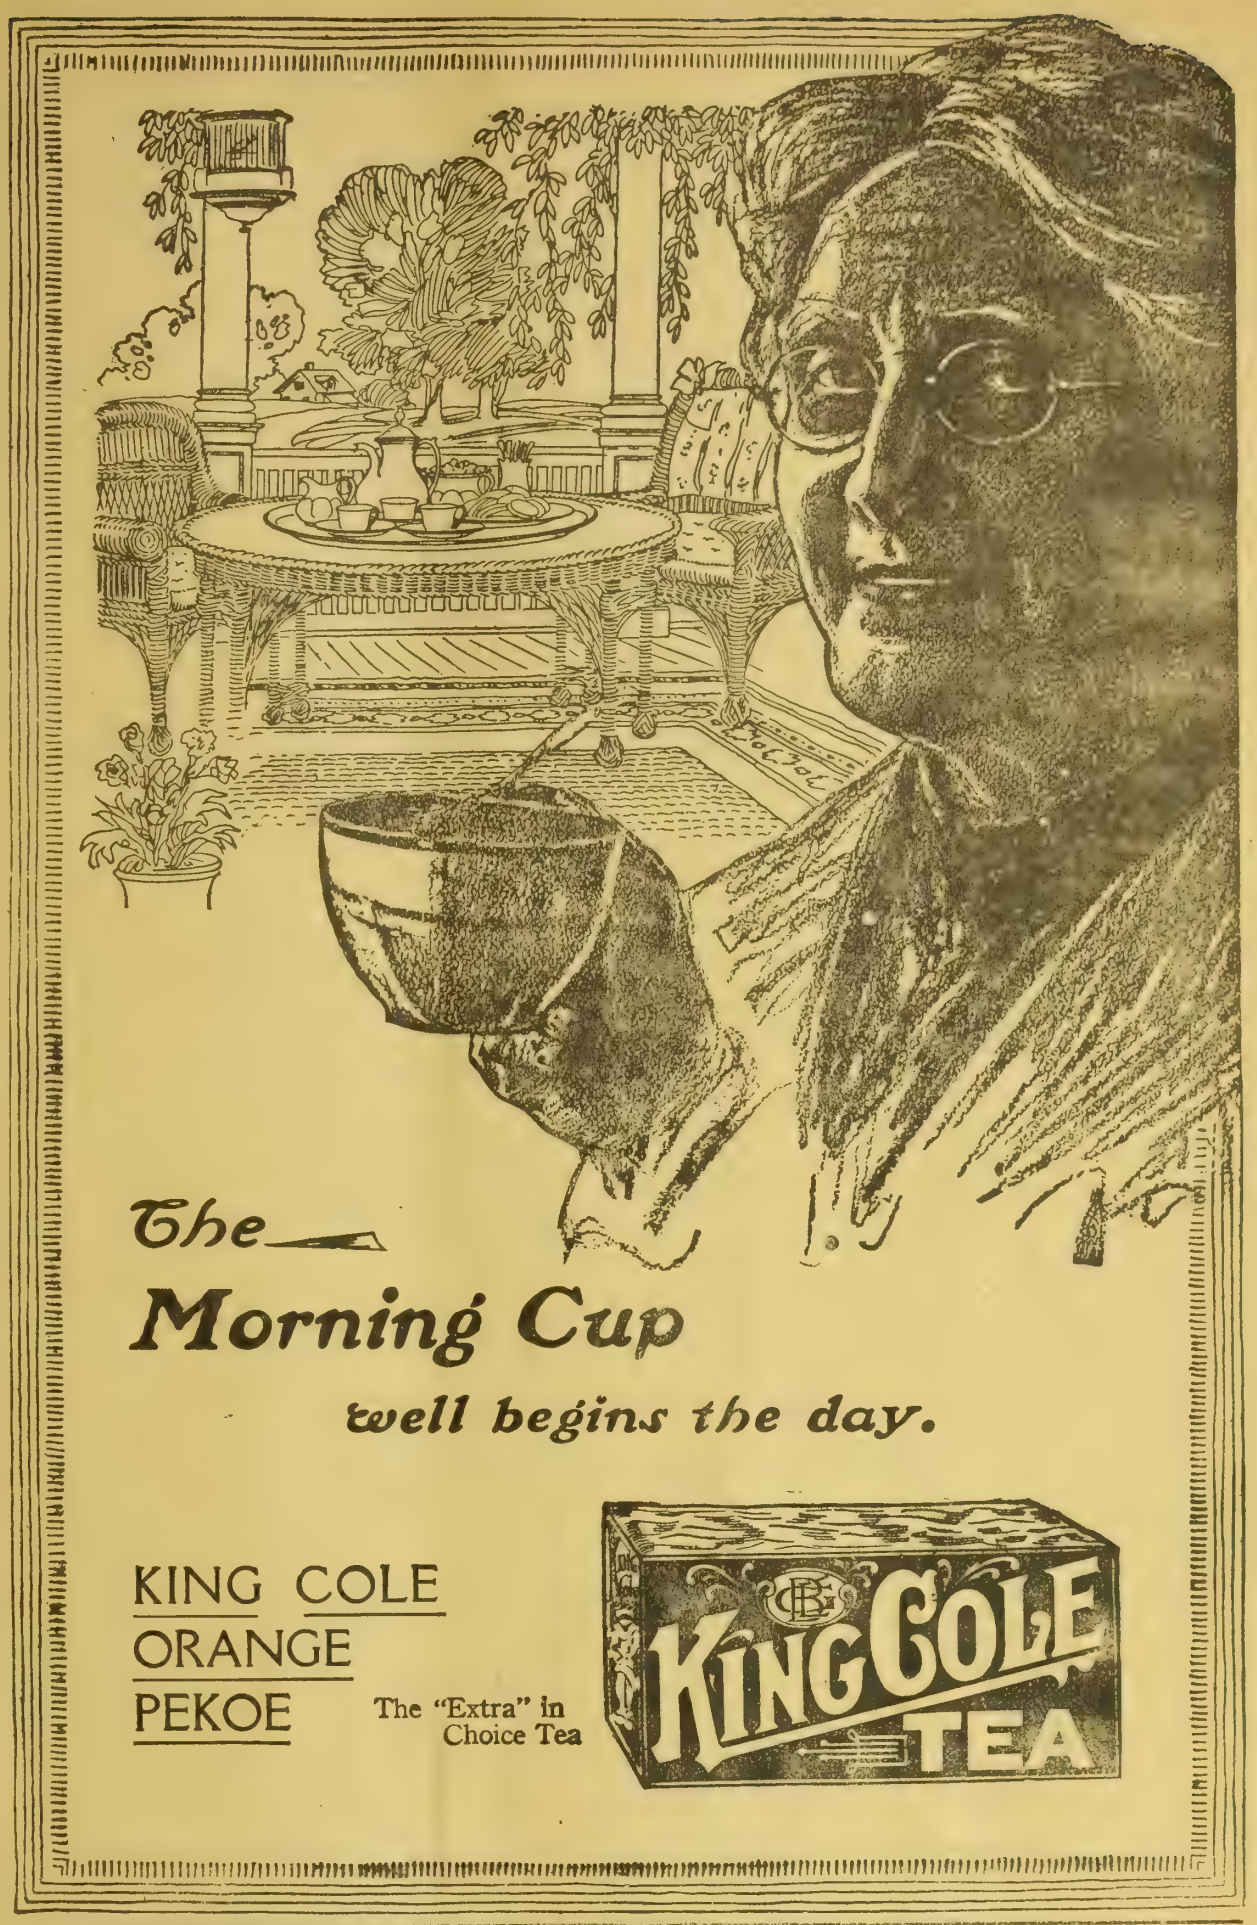
CARE OF SHOES AND GLOVES

Women are learning to be careful of gloves these days. One may not pick up a pair of white kid dress gloves for a song, and even the price of dry cleaning has gone up. The best way this year is to purchase several pairs of really good gloves and make them give the best service by taking infinite care of them, repairing the letsa rip instantly, by smoothing the gloves out flat and never rolling them into a wad, by protecting them from wet on rainy days and by having the mcelaned before they get so soiled that hard rubbing is necessary. Shoes also will receive extra care and attention this year. Every pair will be neatly treed while not in use, oil will be rubbed into the leather to keep it soft and pliable and soes will be exchanged for slippers the moment one comes into the house. The heavy laced sport shoes for rough weather wear will stand much hard usage, but daint ybuttoned boots for formal wear should be carefully protected by rubbers when povements are damp.

A well-cared for shoe will last longer and look better while it lasts than one that is treated without the respect footwear should have these days of high prices.

Wesomeimes say regretfully that our friendship is not worth much because we cannot do for others what we long to do for them, nor give to them what we would like to give. But true friendship can always give that which counts for most, that which is the most precious.

Turn the case around. What is it worth to you to know that some one isinterested in all your interests; that some one believes in you, cares for every joy and grief that touches you? You are stronger and braver every day of your life for the knowledge or sympathy and mutual interests; you are more likely to succeed because some heart shares in the efforts you make. If friendship gives all this to you, shall your friendsnip be worth less in return, Faith and loyalty are the most valuable gifts w ecan offer, and count the most for nappiness and help.



MARKETS.

TME CATTLE MARKET

Montreal, Dec. 14—At the Canadian Pacific Live Stock Market today the offerings amounted to 600 cattle, 900 sheep and lambs, 700 hogs and 250 calves. A feature of the trade at this market was the improved demand from American buyers for supplies, and a larger volume of business was done in this direction than the previous week, which tended to relieve the market of th surplus stock that had come forward. The shipments so far this week were 300 cattle and 2,000 lambs to Boston and 154 cattle to Philadelphia, while 275 cattle and 903 hogs were shipped to Toronto.

There was no important change in the condition of the market today for cattle. Supplies of all grades were ample to meet requirements, and a fair trade was done at steady prices. There were a few small lots of good to choice steers available, which sold at from $11.50 to $12.50 per 100 lbs., but the demand was principally for steers ranging from $9.50 to $10.50, while common lots sold at from $7.50 to $8.50. Some small lots of choice breeders' cows brought $9.25 to $9.50, and the lower grades sold from that down to $7, and the offerings of bulls were disposed of at from $7 to $9.25 per 100 lbs. as to quality. The demand from packers for canning stock continues good and trade in this line was fairly active, with sales of bulls at $5 to $5.50, and cows at $4.50 to $5, with the better grades of bulls selling at $5.75 to $6.25 per 100 lbs. According to advices from Toronto on Tuesday, sales of some Christmas baby beeves weer made as high as $15 to $20 per 100 lbs., and extra choice steers at $14 to $15, the outside price for the former being a record one for this class of stock in any Canadian market.

On account of the renewed demand from American buyers for lambs, the tone of the market has ruled firm at the late advance noted. The offerings today were smaller, but they were ample to fill local wants and a fair trade was done in Ontario stock at $14.50 to $15, and Quebec lambs sold at $13 to $13.50 per 100 lbs. The trade in sheep was quiet and prices ruled steady at from $8.50 to $10 per 100 lbs. as to quality. The demand for calves was good and sales of a few extra choice milk-fed veals were made at $15 to $16, while choice stock sold at $13 to $14, and stall-fed calves at from $5 to $9 per 100 lbs. The tone of the market for hogs was firm under a good steady demand from packers for supplies and sales of long-run selected lots were made at $18.50, and short-run stock at $18 to $18.25 per 100 lbs. weighed off cars.

Winnipeg, Dec. 11—Live stock receipts at the Union Stock Yards today were 2,800 cattle, 41 calves, 2,700 hogs and 347 sheep and lambs. Quotations: Butcher steers $7 to $14.50; heifers $7 to $11; cows $5 to $10.25; bulls $5 to $7; oxen $4.50 to $8.75; stockers and feeders $4.50 to $10.50; veal calves $5.50 to $9.50. Sheep, $10 to $11; lambs $14 to $14.50. Hogs, selects $17.75; sows and heavies $11.50 to $13.75; stags $10 to $12; lights $14.

THE PROVISION MARKET

Montreal, Dec. 14—There was no important change in the condition of the market for live hogs here today, prices being maintained with a steady demand from packers for supplies which were none too large and sales of long-run selected lots were made at $18.50, and short-cut stock at $18 to $18.25 per 100 lbs. weighed off cars. An easier feeling prevailed in the Toronto market on Tuesday, that is to say the prices quoted were a shade lower than last Thursday at $18.50 to $18.75 per 100 lbs. weighed off cars and at $18.25 to $18.50 fed and watered, but evidently the market was in an unsettled condition as these quotations were only given for what they were worth. A very steady feeling continues to prevail in the Winnipeg market and prices for selected lots were unchanged at $17.75 per 100 lbs. weighed off cars. On account of the favorable weather prevailing, a good steady trade continues to be done in country dressed hogs in a wholesale jobbing way, and prices were maintained with sales at $22 to $22.50 per 100 lbs. while city abattoir fresh-killed dressed hogs were quoted at $24.50 to $25 per 100 lbs.

There was practically no change in the market for smoked and cured meats, prices being steady for all lines with a fair amount of business passing for the season for domestic account in a wholesale jobbing way, and sales of 8 to 10 lb. hams were made at 37c per lb., 12 to 15 lbs. at 35c to 38c, and heavier weights at 34c, while breakfast bacon sold at 42c to 43c, Windsor selected bacon at 45c to 46c, and Windsor boneless bacon at 48c to 50c. The demand for barrelled pork continues to be somewhat limited, and the market is quiet with car lots of American bean pork quoted at $41 per barrel duty paid, short-cut clear pork at $46, and clear fat back pork at $56.

The tone of the market for lard remains about steady, but the volume of business reported in a wholesale jobbing way was rather small and the market on the whole was quiet with sales of Canadian pure leaf grades in a wholesale jobbing way at 31c to 31½c per lb. in 20 lb. wood pails, and at 32c to 32½c per lb. in 1 lb. blocks, while American compound lard sold at 27c per lb. in 20 lb. wood pails.

Chicago, December 11—Expected resumption of hig shipments to Chicago tomorrow largely offset in the jrovision market the influence of the immense movement of meats and lard to the seaboard. Prices closed varying from 12c decline to a rise of 15c.

DAIRY PRODUCE TRADE

Montreal, Dec. 14—The receipts of butter today were 265 packages, as compared with 190 for the same day last week, and 172 for the corresponding date a year ago. There were no new developments in the condition of the market today the undertone being very firm, but the demand is still somewhat limited from all sources for supplies, and the volume of business passing is rather small. The jobbing trade was also reported quieter with finest creamery butter selling at 50c to 51c per lb. in solid packages, and at 51c to 52c in 1 lb. blocks.

We quote wholesale prices as follows:

Finest creamery	51c to 52c
Fine creamery	50c to 50½c
Finest dairy	44c to 45c
Fine dairy	40c to 42c

The receipts of cheese today were 171 boxes, as against 1,674 for the same day last week and 147 for the corresponding date a year ago. The market was quiet and firm with a small business passing for domestic account in Quebec goods at 26½c per lb.

The following prices are being paid by the Commission:

No. 1 cheese	25c
No. 2 cheese	24½c
No. 3 cheese	24c

THE LOCAL FLOUR MARKET

Montreal, Dec. 14—The demand for spring wheat flour continues to be somewhat limited and the market is quiet with only a small volume of new business passing for domestic and country account, but the millers are all busy and running to their full capacity owing to the large orders on hand for export account. The tone of the market is about steady with car lots of Government standard grade selling for shipment to county points at $11.25 per barrel in bags, Montreal freights, and to city makers at $11.25, while lots of 50 to 100 bags sold at $11.35, and smaller qantities at $11.45 delivered, less 10c per barrel for spot cash. The trade in winter wheat flour is also quiet and prices are unchanged with sales of broken lots at $11.10 per barrel in new cotton bags, and at $10.80 in second-hand jute bags ex-store. The tone of the market for substitutes is easy with only a small business passing in broken lots of rye flour at $11 to $11.50, oat flour at $11.20, white corn flour at $9.80, barley flour at $9.20, and mixed corn flour at $8 per barrel in bags, delivered to the trade.

MILLFEED AND ROLLED OATS

A very firm feeling prevails in the market for all lines of millfeed owing to the continued limited supplies available and the good demand from all sources for the same, and sales of small quantities of pure grain moullie were made at $68 to $70, pure oat moullie at $64, barley feed at $60 to $62, and mixed moullie at $50 per ton, including bags, delivered to the city trade, while small quantities of bran sold at $38.75, and shorts at $43.75 per ton, ex-warehouse, including cartage, and car lots of bran were quoted at $37.25, and shorts at $42.25 per ton, including bags, ex-track, less 25c per ton for spot cash. A very unsettled feeling has developed in the market for rolled oats, and prices are so irregular that they are difficult to quote at present. Golden cornmeal is selling at $5.40 to $5.60 per bag, delivered to the trade.

COUNTRY PRODUCE

Montreal, Dec. 14—Little change has taken place in the market for new-laid eggs during the past week. On some eastern markets and in British Columbia and increase in receipts is reported, but in the middle west new-laid eggs are exceptionally scarce and the trade is relying upon storage stocks to meet the current consumptive demands. Practically no change in price has taken place except in British Columbia where storage specials are from 7c to 10c lower than last week. The eastern trade report buying selected fresh at 62c to 65c delivered, the price varying according to size and quality and some Ontario country shippers report sales at 60c to 67c f. o. b. country. Most of the held stock seems to have been disposed of and the quality of receipts is improving.

Storage stocks are moving into consumption rapidly at prices over cost, permitted by the Food Board. In western Canada the storage surplus over and above those required for local consumption, has been almost entirely disposed of. A car of western eggs arrived during the past week on the Toronto market, and another car is offered at 55½c f. o. b. Brandon. Under such conditions as noted above, while it would seem as if prices had reached top, there is little likelihood of any decline for some time to come.

The domestic trade in eggs today was fairly active, and the tone of the market remains very firm for all grades. The receipts today were 193 cases, as compared with 850 for the same day last week, and 168 for the corresponding date a year ago.

We quote wholesale jobing prices as follows:

Fancy new laid eggs	73c to 75c
Strictly new laid	00c to 70c
Selected fresh stock	00c to 55c
Cold storage selects	00c to 54c
Cold storage No. 1	00c to 50c

On practically all markets in Canada poultry receipts during the past week have been heavy, this is particularly true of dressed stock. The market is about steady however, under a fair consumptive demand, the surplus going into storage. Some Ontario packers are now filling orders of dressed poultry for shipment to British Columbia, in which province local receipts are only sufficient to meet the current consumptive demands. In connection with western orders turkeys are in very keen demand and Ontario dealers shipping to the west are offering 35c for live and 40c for dressed turkeys delivered. Geese are said to be very plentiful throughout Western Ontario and so far the demand is only moderate. Two or three instances are reported of dealers making offers for frozen poultry delivered, prices reported being, fowl 35c, chickens 27c, geese 30c. In Alberta reports point to a heavy marketing from certain sections of pullets and hens. It is said feed shortage is causing farmers to market chickens that should be carried over the next year and this would point to a shortage of eggs in many Alberta sections this coming spring.

The domestic demand for dressed poultry today was again very good, and an active trade was done which resulted in all supplies in first hands being well cleaned up. There was no change in prices, but the undertone to the market was very firm, with every indication of a brisk trade being done for the next ten days to come. Sales of choice turkeys were made freely at 40c o 41c per lb. principally at the outside figure, and extra milk-fed chickens at 35c.

We quote wholesale prices as follows:

Choice turkeys, per lb.	40c to 41c
Lower grades	38c to 39c
Milk-fed chickens	33c to 34c
Ordinary chickens	24c to 29c
Fowl	24c to 28c
Geese	25c to 26c
Ducks	32c to 34c

There was no change in the condition of the market for potatoes to-day, prices being maintained under a good steady demand for small lots to meet immediate requirements, and a fairly active trade was done in a wholesale jobbing way in Green Mountains at $1.90, and in Quebec white stock at $1.70 to $1.75 per bag of 90 lbs., ex-store. Car lots of Green Mountains were quoted at $1.80, and Quebec white stock at $1.50 per bag of 90 lbs. ex-track. The demand for Quebec turnips continues good and prices rule steady at $1.25 per bag of 70 lbs., and onions are selling freely at $1.50 to $1.75 per bag of 70 lbs. ex-store.

THE BALED HAY MARKET

There was no change in the condition of the market for baled hay today except that supplies are commencing to come forward a little more freely and local buyers have less trouble in filling their requirements. A fair trade was done in this respect and prices were unchanged, with sales of car lots of No. 1 timothy at $26 to $27, No. 1 light clover mixed hay at $26 to $27, No. 2 timothy at $25 to $26, No. 2 cloved mixed hay $24 to 25, and No. 3 timothy at $23 to $24 per ton, delivered to the trade.

BETTER ASSORTMENT FEEDS

Standard Feeds will now come in cars with Oats, Barley Meal, Chicken Feeds, etc. Are you interested? Cotton Seed Meal Coming

A representative of the Maritime Farmer has arranged for the distribution of a variety of feeds with Ground Special, Ground Standard, Molasses Hog, Molasses Dairy, Molasses Horse. We can now supply barley meal, oats of any grade in bags or bulk, chicken feeds, etc. They will all come in the same car. The prices will be available in the course of a day or so and if you are interested you might write us. We also have a few cars of flour, shorts, bran, oats and other mill products. These are offered while they last to agricultural organizations.

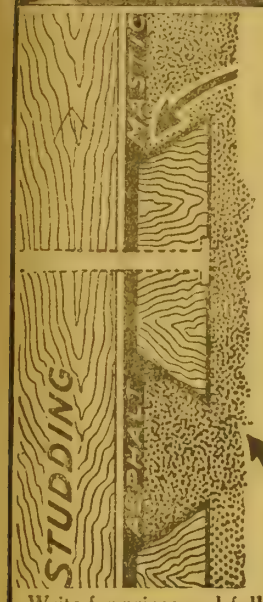
We have also applied for a share of 25.000 tons of cotton seed meal. which is coming to Canada. We have asked for an allotment for farmers in the Maritime Provinces to be distributed in car lots at cost. If you want COTTON SEED MEAL, send in your application. The price of this feed was fixed last fall by the United States

RE-MODEL THE BARN YOURSELF

Don't let the scarcity of carpenters prevent you from putting on that addition to the house—re-modeling the barn—or building the poultry house, grain bins or garage that you need so badly.

Do the work yourself, using BISHOPRIC STUCCO BOARD. It comes in sheets 4 ft. wide and 4 to 10 ft. long, ready to be nailed to the studding. It takes the place of boarding, sheathing paper, furring strips and laths—and saves 50% of the cost of building in time, labor and material.

BISHOPRIC STUCCO BOARD



This Cut represents a cross section of wall, showing Plaster, Stucco, Stucco Board *(note the Key holding Stucco)* Asphalt, Mastic and Fibre Paper

Write for prices and full particulars.

BISHOPRIC WALL BOARD CO. LIMITED - OTTAWA 136

food controller. The quality and price have not yet been announced for Canada, but the Maritime Farmer put its application in some months ago and is now in touch with the authorities in connection with the distribution of this feed. How much the Maritime Provinces will get is as yet undecided. Write us if you are interested.

BIGGER AND BETTER GRIST MILLS FOR N. B.

The increased interest among the farmers of the province of New Brunswick in regard to the production of sufficient grain to bread themselves, and the results they have achieved in recent years, particularly during the season 1918 by their hearty response in the campaign inaugurated and successfully carried out by the local Department of Agriculture along this line, necessitates increased milling facilities. In response to the demand mills are being erected in various sections of the province. For several years the New Brunswick Department of Agriculture has been bonusing new flour mills to the extent of $1000 for mills of twenty-five barrels capacity. The time has now arrived when the amount of work offered in the respective districts is more than a twenty-five barrel mill can accomplish in sufficient time to be of good service to the community in which they are located. Many of our twenty-five barrel mills are now running night and day, turn. The outcome is that progressive millers are seriously contemplating the installing of another unit to double their capacity. Prospective builders are planning for fifty-barrel or larger mills with an eye to steady development of work so well begun.

The erection and maintenance of mills capable of meeting the requirements, whether put in as additions to existing plants or newly installed mills represent a considerable outlay. The larger capacity mill will finish the local work in much less time than the smaller mill, and consequently unless grain is procured from outside sources to keep the mill going all the year, the larger mlil will be closed down for a longer period between seasons than will the smaller mills. This is one of the obstacles in the way of the larger mills. To eliminate this obstacle to a certain extent and give the grain growers a chance to get their flour requirements without undue delay, the Minister of Agriculture for the Province of New Brunswick will recommend to the Government of the Province the advisability of increasing the bonus on fifty-barrel mills to $2000.

When a man intimates to the Department of Agriculture that he is contemplating the erection of a flour mill and would like to receive a bonus, the Department sends a qualified representative to inspect the proposed site anw ascertain the grain growing condiions of the district in which the proposed mill will be located. If he finds that there is a possibility of ample work for the mill without clashing with any other established bonused mill and reports favorably the Minister will grant the bonus on condition that the proposed mill and building be up to certain set specifications and that it be kept insured and operated for a period of at least five years. The insurance policy is made payable to His Majesty the King as represented by the Minister for Agriculture as his interest may appear. The mill is inspected on completion, when, if satisfactory, one half the bonus money is paid. The remainder of the bonus is paid after the mill has completed one year of successful operation.

The encouraging of better and more adequate and expeditious milling facilities as proposed by Mr. Tweeddale will go a long way towards inducing the farmers of the province to grow more grain for bread, more feed for their live stock and retain in the province a great deal of money that otherwise goes to fill the coffers of the other provinces.

LEGISLATION AFFECTING DAIRY FARMERS PLANNED FOR NEAR FUTURE

(Continued from page 167)

able or low producing cows from the dairy herds. The resolution recommended that special effort should be made by all channels of instruction and organization toward the fulfilment of this end.

A resolution was read regarding "Oleomargarine Legislation" that the federal authorities saw fit to temporarily admit the manufacture and sale in the Dominion of Canada of this article. The feeling prevailing in the discussion that followed the reading of the resolution that the order be now rescinded, was that Canada as a young country, that had not reached the limit of its production, did not require the introduction of such articles of food. In the meantime it was having little effect on the butter industry, but it was stated that when oleomargarine manufacturers, after the war, could get the better quality material to make it, which would then be more available, it would come into more direct competition with butter. As a food for adults it might be used as a substitute, but for children it was not considered suitable for growing health.

"Taking Milk Samples," formed a subject of a resolution moved by P. Pallesen and seconded by E. H. Stonehouse. It has for its object the universal and safe method of drawing samples of milk to be tested, so that no occasion for friction or unfair dealing can arise between vendor and municipality in dealing with the quality of milk demanded.

The BEEMAN GARDEN TRACTOR

MAKE twenty acres produce what you formerly grew on twenty-five.

The Beeman Garden Tractor and Walking Engine will help you do it. It makes more intensive production possible by permitting the cultivation of closer-planted rowed crops.

The Beeman is the tractor that is revolutionizing market garden farming—a practical tractor and engine at less than the cost of a good horse and performing the work of two.

The Beeman is a 1½ H.P. Tractor, only 17 inches wide, working 5 hours on one gallon of gasoline—or an engine to operate your farm machinery, developing 4 H.P. and consuming but one gallon of fuel in seven hours.

A boy and a Beeman can do the work of a man and two horses at 30 per cent less cost. A touch of the finger controls every operation of starting and stopping.

Investigate the Beeman Garden Tractor. Price $285.00 F.O.B. Factory.

THE ECONOMY OF DAIRY FARMING

The dairy cow is the most economical producer of human food of all our farm animals. No other animal can turn into so much money the great range of animal foods, roughages and concentrates, grown on the average farm. The product of no other farm animal, when sold off the farm, removes so little of the fertilizing constituents or plant food from the soil. She is the only farm animal that every day yields a marketable product within twenty-four hours of the time her food is fed. It has been proven by careful experiments that a cow yielding thirty pounds of average milk per day will in one week produce 26¼ pounds of dry matter, all of which is edible and immediately available for human consumption. In the same time a fattening steer gaining two pounds per day on approximately the same feed, will produce only 10¼ pounds of edible dry matter. It has also been shown that from 100 pounds of digestible matter in the food, that the dairy cow produces 18 pounds of digestible solids suitable for man; the pig 15.8 pounds; poultry, as eggs, 5.1 pounds; as meat, 4.2 pounds; lambs 3.2 pounds; steers, 2.8 pounds, and sheep 2.6 pounds, clearly demonstrating that the dairy cow easily leads all farm animals in economy of feeding operations.

With this great advantage in economy of production, it is quite easy to discern why the dairy cow tends to supplant the meat-bearing animals in regions where land is high priced and population dense. She gives the greatest financial returns from the feeds grown on the farm, and therefore enables the owner to get the necessary addd returns from his high-priced land. Still easier is it to see why the dairy cow has supplanted the meat-bearing animals where land has become impoverished. Here she enables the farmer to get the greatest financial return from what little his land does produce and at the same time returns to the soil practically all the plant food taken out by the feed she eats.

In spite of her great superiority over other animals in the use she makes of her food, there are some factors in the dairy industry that restrain or limit the spread or increase of dairying to the greater exclusion of other lines of live stock production. First in importance is the greater amount of labor entailed. Roughly speaking, it takes seventy-five hours to milk a cow for an ordinary lactation period. This amount of labor has no counterpart in other branches of farming. It is extra work above feeding and other care. It must be done twice a day every day she milks, no matter what conditions of weather, what rush of work, or what social duties prevail. Therefore, as a business, dairying does not appeal to the farmer who can make a reasonable living or income otherwise. Again, there is an enormous bulk of dairy products derived from cows that are not strictly dairy cows. This butter and milk comes from a large number of small herds at the time of the year when cows are fed the cheapest, in spring and summer. These herds are cheaply wintered on the roughest and most unmarketable foods grown, and more expensive labor, the farmer's own family, at those times of the year when labor is at its greatest demand. These herds are the beef herds or general farming herds of the country, and although the contribution of each to the butter market is small the sum total is a very large amoun of butter that has an appreciable effect in keeping down the market price of butterfat, which is in the final analysis the controlling factor in the price of all dairy products.

In the course of history of a new country, such as ours, the growth of dairying is obviously slow. But steady growth is inevitable as according as population increase, lands become more valuable through proximity to great markets or become impoverished through bad cropping systems, and the dairy cow introduces herself as the great stabilizer of lands and peoples, the one animal without whose help the human race could not exist.—O. A. C. Bulletin No. 253.

It may be truthfully said that the dairy industry rests on the science of bacteriology, and that nearly all the methods employed in the production and handling of these products are based on bacteriology principles.

FERTILIZING THE ORCHARD

(Continued from page 169)

If the orchardist is depending upon commercial fertilizers alone and his orchards are unthrifty, it will be advisable for him to apply an additional 100 pounds of nitrate of soda broadcast at the time of seeding down his cover crop. In general it is wise to apply the fertilizers carrying phosphorus and potash to the amount required by the first of June, and, as already stated, 500 pounds acid phosphate, or 600 to 800 pounds slag may be used.

FEEDING THE HUMAN MACHINE

(Continued from page 165)

ble B in lettuce, spinach, in fruit to some extent, and the various leaves and greens that are upon the market. A very large quantity of these articles are not necessary, the main requirement being that our diet is kept varied by the use of fruits, vegetables, and greens.

In making out the best diet for human beings, it is necessary, therefore, to bear in mind that mere chemical analysis is not sufficient. So many calories of protein, so many of carbohydrates, and so many of fats are necessary, it is true, but in addition there must be fat-souable A, and water soluble B. But that is not enough.

Unless there are enough mineral elemnts in the diet, the system cannot thrive. Just three minerals are essential. One of these is calcium, the property that gives hardness to the bone. The other two are sodium and chlorine. Calcium is supplied largely in vegetables and the leaves of plants, and not so liberally in cereals.

Editor's Note—The foregoing from the columns of one of our American exchanges touches a problem Canada is up against, not only now, but in the years to come, as our centres of population become more and more congested.

Farmer and city-man, alike, must combine for the protection and fostering of the dairy industry, and this can not be done by angry recriminations, misunderstandings, and mutual distrust, based on misinformation, just as is at present carried on against the milk producers for the city of St. John.

THE PLOWING CONTEST

The plowing contest which is the gala occasion of the year with our Scotch friends is slowly coming into favor in this country, and the localities where contests have been held are so well pleased with them that they are invariably repeating them every year.

Let us look for a moment at a typical Scotch plowing contest, and see if it isn't something we can copy more universally and profit generally thereby. Imagine a crisp October day, a day typical of our Indian summer days, and by early forenoon the people from all the countryside for miles around begin to gather decked out in holiday attire, for the plowing contest is one of the most important, if not the most important occasion of the year for the farmers.

The magnificent teams of Cyldes are all groomed immaculately and bedecked with roses and ribbons. The leather of the harness glistens, and it is polished over the oil, and the mountings are burnished until they are as bright as mirrors, for prizes are offered for the best groomed teams and the best kept harness. The teams have been trained for days, possibly for weeks, for the event.

The plows are all most carefully sharpened and scoured, and each contestant has tried out his plow and most carefully adjusted it prior to the day of the contest, for he knows that it is impossible to do even a fair job of plowing unless the plow is very carefully set and adjusted to the team, and no adjusting is allowed during the contest.

There is a great deal of friendly rivalry and joshing among contestants and especially among the helpers and the crowd, much inspecting and discussion of plows as to whether there is enough "suck" for this particular land and whether the coulter will cut a clean furrow through the turf, sod being invariably used for plowing contests.

The plowmen, frequently as many as thirty of them, all line up at the ends of their various one-half acre plots and at a signal the contest is on, in a way like a race, yet a very slow one, for the making of the back furrow which consists of two very shallow three cornered furrows turned with their lower corners just meeting, is a most particular job and an art that is not learned in a day or a month. As a matter of fact, before a man can pass as a plowman in Scotland he must serve an apprenticeship at the job. There are cries of "Hold on there, Jock, hold in to the left a wee bit", from the helpers who stand at the end of the furrows and keep a sharp look out for the least bit of a curve in the line of furrow. The helped also takes the plow and team at one end and drives across the end to rest the plowman and give him an opportunity to see tht work of the others. The work is quite tiresome for the plowman walks or rather hops along with one foot in tne furrow anc one up on the land, braced against any swerving of the plow, and his eye never leaves the end of the furrow ahead of him. The result of all this work is a job of plowing that is a sight to see. The farrow is usually about 7 or 8 inches wide, instead of 12 to 14 inches as in this country, by 6 or 7 inches deep. The line of the furrows sticks straight up as square and true as if molded in clay, with not a break from one end to the other, truly the work of a master plowman.

A medal is usually given to the winner and several smaller prizes, commonly cash, are given to the next in rank along with prizes ti the best groimed teams and the best cared for harness.

The good fellowship and friendly rivalry brought out by the plowing contest is something that any community will be better for, and occasions when the farmer can come out and demonstrate his ability as a master workman, for master workman he undoubtedly is, are few and far between.

MAKING BOVINE OUTLAWS

A herd of cattle came to notice recently because of the outlaw character of the whole drove. No ordinary fence would hold them. They would jump, plunge or crawl past any such barrier. Every one of them would need to be blindfolded or wear a poke on the neck or else a chain dangling from the nose in order to feel respect for the usual restraints imposed upon tame cattle. And these cattle were not wild;

Ingersoll Service
Night and Day—The World Round

Quarter of a century ago many a watch pocket had to go empty—watches were expensive. Then Robt. H. Ingersoll made and sold the first Ingersoll watch—the Maple Leaf model, and reliable time pieces came within the reach of everyone. Fifty Million Ingersoll watches produced since then have furnished a good time-keeping service to the people of every nation, the world around. With the introduction of the Radiolite—the watch that tells time in the dark—this service is available both day and night.

The Ingersoll idea was not only to design a reliable watch but to develop a factory system that produces thousands of watches in the shortest time and the fewest machine operations. In spite of advancing costs of material and labor and strenuous war conditions the democratic Ingersoll still sells for a price that puts it within the reach of every inhabitant of the Dominion.

Each part is inspected many times and every finished movement is thoroughly tested before leaving the factory—for the Ingersoll standard of quality is inflexible and every Ingersoll is guaranteed.

Buy a watch with the name INGERSOLL on the dial and you are guaranteed a good time-keeping service.

ROBT. H. INGERSOLL & BRO., - 128 Bleury Street, MONTREAL.

Ingersoll Radiolite

Tells Time in the Dark

they were merely unruly. They had learned to go wherever they pleased.

Inquiry revealed a history of the case which accounts for this unusual behavior. The cattle had been kept upon a farm where the pastures were perennially overstocked and the grass always short. Wire and hedge fences were neither of them ever in good repair. End posts were not braced and the barb wires were always loose. Hedges were full of holes which were stopped by a mere bluff of small brush which was side-trimmed off the hedge as needed. Whenever the cattle broke out they got a good fill of feed from cornfield, wheatfield or meadow before driven out. Then the fence was repaired barely enough to match the rest of the line in strength, maybe not always so well as that. The consequence was that breaking out was so common an occurrence that the cattle became adepts at it.

Plenty of feed and a strong fence around it make the sure combination for confining stock and preventing the formation of unruly habits. When animals break through a fence the whole line must be made stronger than that spot was before. Last summer when two colts were running at play one of them accidentally jumped over a seven-rail fence located at a gap in the hedge. The owner promptly built it up to ten rails with stakes and a rider besides, so that the whole height was about doubled. He had the right idea. Such a breach of equine manners did not occur again. If the fence had been built up a rail at a time as occasion might suggest, the colt probably would have become a high jumper.

CREAM SEPARATOR MUST STAND LEVEL

In order to get the best results with the separator it must stand perfectly level on a solid foundation. A block of wood about two feet in diameter to which the machine is securely fastened makes a good solid faundation but a block made of concrete is much better. This makes a permanent foundation and is easier to keep clean than wood which has a tendency to become greasy. In molding a block of concrete for this purpose one should not forget to mold in four bolts for fastening the machine. With this solid foundation there is no chance for jar or vibration of the separator, two htings that must not be allowed.

One of the most important items in operating the separator is to run it at a proper rate of speed, that is at the speed indicated on the handle or in the instruction book. A lesser number if revolutions of the crank per minute than that specified on the handle or in the instruction book will cause a los of fat in the skim milk. With a little practice the proper speed and uniformity of motion can soon be learned. There is a characteristic hum to the bowl that is not heard eithed when the speed is too low or too high .

Operating a cream separator by hand is certainly no easy task but if one has a little gasoline engine to run the machine the job of operating is a pleasant one. Small engines are offered at such low prices that one can be afforded by any farmer and the cost of fuel required to keep one busy is so small that it can hardly be considered when we take into consideration the amount of work it will do and the labor it will save.—H. W. J.

WATCH THE CREAM SEPARATOR

The separator should be watched. Be sure that the machine is level and securely fastened to a firm foundation. Remember that the speed of the separator is an important factor in its efficiency. If the crank is turned too slowly an excessive amount of fat will be left in the skim-milk. The milk should not be aloowed to enter the machine until full speed is attained.

A temperature of 90 degrees F. is best for separation. If milk is cold when separated there is too much loss of fat. If the milk becomes cold it may be warmed by placing the can of milk in hot water. It is preferable, however, to separate the milk soon after it is drawn and before it becomes cold.

The separator should be kept clean if the highest efficiency of the machine and the best product is to be obtained. At the end of each separation flush out the bowl by pouring about two quarts of lokewarm water into the supply can. The parts may then be washed with scalding water, after which they should be allowed to dry.

PIN WORMS

My horse shows all symptoms of having worms, and is constantly passing the small pin worms. He licks the walls of the stable, yawns frequently and often has slight colicky pains, when he will lie down and get up, stretch his head out and roll up his upper lip. These spasms are of uncertain duration, sometimes lasting an hour or two, and others only a few minutes. He has an abnormal appetite, eating anything in reach and, if allowed, even his fæces. His bowels always moved frequently and especially at road work, when at times they became quite loose. Have been treating him for worms according to pour directions in The R. N.-Y.; copperas, salt and sulphur; have given him the treatment two weeks with interval of 10 days. I have not seen any large worms, but lots of the pin worms. Now two or three miles or road work make him scour so it is impossible to drive him. Should one keep on repeating the medicine, or is one repetition enough, and if it is effective, should one be able to see the worms when they pass? I am feeding him whole oats, corn stalks and oat straw.

The worms you see are pin worms and inhabit the rectum and are not killed by the medicine you have been giving. Destroy them by injecting into the rectum on three alternate nights a week three or four quarts of soapy warm water and a cupful of tobacco tea made by placing tobacco stems or leaves in boiling water and allowing to stand covered for 12 hours. The salt-sulphur-copperas combination destroys large worms in the intestines, whereupon they are digested and so do not appear in the feces. If the horse is to do well you should feed good hay instead of cornstalks and straw and add wheat bran and ear corn to the ration.

HEAVES

I have a mare eight years old this spring that has recently got the heaves. Can the heaves be cured? Is it advisable to breed a mare with the heoves, R. H. W.

Heaves is incurable when confirmed, as the small air chambers or cells of thelungs break down into large cavities, the walls of which cannot contract sufficinetly to perfectly expel air. The agdominal muscles are brought into play to help expel the air, and this causes the double, bellows-like action of the flanks which is characteristic of the disease. A mare should not be bred when affected with heaves, as the tendency to the disease is considered hereditary. A heaving mare often proves barren. Distress of the disease usually may be relieved by use of a proprietary heave remedy, or by giving Fowler's solution of arsenic twice daily, starting withone-half ounce as a dose and increasing to three such doses daily until no longer required,when the medicine gradually should be discontinued. Feed grass in summer and wet oat straw in winter in preference to hay. Do not work the mare soon after a meal, and do not give any bulky feed at noon when she has to work.

FERTILIZERS !

THE best potatoes grown in N. B. last year were grown with our best by test Potash Fertilizer.

We produce our high grade 2-8-2 and 3-6-5 brands expressly for N. B. potato growing, securing our own potash in Canada, all in water soluble form.

If you are using other makes of Fertilizers try as an experiment some of our brands alongside and watch results.

We produce a full line of Fertilizers. Write us for prices, terms, etc.

CHATHAM, ONTARIO

MILK, ITS COMPOSITION, CARE AND FOOD VALUE

(Continued from page 166)

ly agitated at a proper temperature, the fat globules rapidly pass each other and finally begin to stick together. When a sufficient number have adhered, little granules of butter are formed. The richer the cream and the higher the temperature, the more readily will the fat globules unite. Therefore cream, in order to churn readily, yet not too soon, should contain about 30% fat and be at a temperature of, from 52 to 56 degrees Fah. Fat only of the milk solids, is required to make butter. 100 lbs. of milk fat will produce about 116 lbs. of butter. The extra 16 lbs. is made up of water, sale and casein and is known as the "over-run."

2nd. Casein—About 2.5 lbs. in 100 lbs. of milk. Casein or curd when dried is a grayish white powder. Casein is present in milk partly in solution an dpartly in suspension; it is coagulated or thickened by rennet, dilute acids and by the natural lactic acid which is formed when the milk is becoming sour. In the cheese making process, Casein is the substance, which, when thickened by rennet, imprisons and holds the little fat globules and some of the water, allowing a few of the fat globules and the remainder of the water (in which is held most of the other milk solids) to escape when the curd is cut with the curd knives. Casein and fat are the two chief solids of milk from which cheese is made. In fact, without casein it would be impossible to make cheddar cheese.

3rd. Sugar—About 5 lbs. contained in 100 lbs. of milk. It is present in the milk in solution but when dried looks much similar to cane sugar but is not so sweet in taste. It is a very important solid and is the material which is changed by the action of little plants known as Bacteria or Germs, from a sugar to an acid and the milk becomes sour. Milk would not sour were it not for the sugar and the action of those little plants, which latter get into the milk after it is drawn and change the sugar to lactic acid. Milk sugar is the chief solid which is retained in the whey in the process of cheesemaking and is one of the valuable constituents remaining in the whey as a food for animals. The more of the sugar which is preserved instead of allowing it to be changed to lactic acid, the more valuable is the whey for feeding, especially to young animals.

4th. Albumin—About .7 lbs. in 100 lbs. of milk. When dried it is similar to the dried white of an egg. Milk Albumin is not coagulated by rennet or acids but b yheat. When cheese is made, the albumin passes out in the whey and is another valuable solid. The albumin in the whey coagulates at a temperature of about 160 degrees Fah. therefore, to properly pasteurize cheese factory whey, a temperature of about 155 degrees Fah. is sufficient for good results, provided this temperature is maintained for sometime. (Cheese factory whey is pasteurized for the purpose of killing disease germs, keeping the fat evenly distributed, to preserve the sugar as to prevent as far as possible the little organisms known as Bacteria, from changing the sugar to an acid, thus keeping the whey sweet until fed).

5th. Ash—About .7 lbs. in 100 lbs. of milk. It is the mineral matter or that portion remaining after the solids are burned. It is a grayish white color and is made up of a number of different minerals.

Changes which Occurs in Milk

After being drawn from the cow, milk which is handled under average conditions undergoes certain physical and chemical changes. Bacteriological research has shown that there are little microscopical plants known as micro-organisms, bacteria or germs, which are present almost everywhere in nature, in the soil, air, on plants, trees, fruits and sometimes in water. These little plants cannot be seen with the naked eye but with a microscope of high power many of them may be observed and studied. Millions of these little plants may be present in a single drop of milk. They multiply very rapidly if they have the proper media or material in which to grow which contains the food they require, such as the sugar of milk. Most of these little plants divide every twenty minutes, making two. Several millions may be in a few hours the product of a single germ. Other favorable conditions required for the growth of bacteria are moisture and proper temperature. These little plants get into the milk in many ways. When the milk is first drawn from the cow it is almost free from organisms. Germs are always present in the stable dust, on bits of straw, hay, cow manure, flies, hairs, the teats and udder, in the milking utensils (if they have not been thoroughly sterilized with boiling water), on the milker's hands, clothing, and in fact almost everywhere. Every precaution should be taken to prevent germs from entering the milk from any of the sources already mentioned, but with the best of care it is difficult to keep out of the milk all bacteria. When it is realized the important role these organisms play in the decomposition and the souring of milk, it can be readily seen how very important it is to keep out of the milk as many as possible of these germs. If care is exercised in excluding from the milk those substances which carry bacteria, then to a great extend is lessened the number of germs in the milk and the smaller the number present, the longer will the milk keep. So far as the bacteria relating to dairying are concerned, they may be divided into two classes, "good" and "bad" bacteria. The good bacteria are those which have to do with changing the milk sugar into lactic acid, producing in milk and its products a certain pleasant taste and flavor. These bacteria are important in nearly all dairy operations, as it would be difficult to bring about the fermentations necessary in the manufacturing of cheese and the ripening of cream, were it not for the help of these little lactic acid producing organisms. Although bacteria are a help in producing proper fermentations in milk, yet if not controlled, they become masters of the situation and the milk rapidly begins to sour and becomes unfit for many purposes for which it was intended. The "bad" bacteria are those which give rise to putrid decomposition, which is shown by odors and taints in the milk and sometimes a "gassy" condition of the curd. Moreover, many of these bad bacteria pass into the products made from the milk, such as cheese and butter and continue to produce abnormal changes, resulting in butter which rapidly goes "off" in flavor and becomes rancid and cheese, which, instead of developing the clean "nutty" flavor so much desired, develops offensive flavors, odors and tastes.

Care of the Milk

Although all dirt must be kept out of the milk yet in spite of many precautions, a number of germs get in, which soon begin to cause changes in the milk and something must be done to control these organisms. It is known that there are certain temperatures at which most of these little plants will grow to the best advantage; ie—between 70 and 100 degrees Fah. If the milk is left for any length of time without lowering the temperature (cooling) it is being handled in a way (so far as temperature is concerned) for these little plants to rapidly reproduce themselves. It will not, therefore, be long before they have increased in numbers sufficient to change a portion of the sugar to lactic acid and the milk becomes sour. If through careless methods, dirt, such as cow's hairs, dust, bits of straw, hay, cow manure, flies or any such substances are allowed to get into the milk, the inconceivable number of "bad" bacteria conveyed to the milk in this way, may act in such a way upon the milk constituents that the milk becomes tainted and perhaps gassy; putrifaction begins, bad odors arise and the milk becomes unfit for use.

It is known that low temperature (cold) although not entirely killing the little plants which produce the undesirable changes in milk, yet helps to prevent them from increasing rapidly. If there are less of them in the milk, the milk will remain longer in good condition. Having kept the dirt out of the milk and if the temperature is lowered immediately the milk is drawn from the cow, by placing the cans containing the milk in a tank of cold water, bringing down the temperature rapidly to 65 degrees, if the milk is to be sent to the cheese factory (with the addition of ice to the water, to 45 degrees, if the milk is to be used for city consumption and 55 degrees if the cream is to be sent to the creamery) the milk or cream will then be at a temperature which will prevent to a great extent any undesirable changes from taking place for a reasonable time.

Food Flavors

Certain food flavors may be noticed in milk caused from high flavored foods which the cow may eat. Moreover, the milk may become contaminated or spoiled if exposed to stable or other bad odors, because it is well known that milk will quickly absorb odors.

Pasteurization

Milk may become infected with disease producing organisms such as tuberculosis (from cows suffering with this disease or from handlers of milk) diphtheria, typhoid, etc., may be transmitted through milk. Persons suffering from or having been exposed to such diseases should not handle milk.

As a measure of safety where milk is consumed which comes from an unknown source, pasteurization has been adopted. This method as practiced for city milk supply means heating the milk to a temperature of from 145 to 152 degrees Fah. holding it at that temperature for 20 or 30 minutes, cooling rapidly to 45 degrees Fah. Pasteur a noted French scientist originated this method.

Care of Milk in the Home

Milk which has been properly handled, may be delivered to consumers and become contaminated after it is taken into the home, by exposure to bad odors or by being put into unclean or dusty utensils. If the temperature of the milk is not kept low enough after it is delivered to the consumer, bacterial growth will be rapid and the milk will quickly sour or go "off" flavor.

The three chief causes for the changes which milk undergoes are:

1st—Little plants which are present everywhere in nature, get into the milk, increase and produce certain changes. The change known as "souring" may be prevented for sometime by immediately cooling the milk to a low temperature and holding it there. The changes known as "gassy", tainted, decomposed, are only prevented by keeping the dirt out of the milk, although cooling to low temperature assists in preventing these changes.

2nd.—Food which is highly flavored, such as rag weed, leaks, or turnips will produce food flavors in milk. Such foods should not be fed to milch cows.

3rd—The milk may absorb bad odors and should not be exposed to such odors.

4th—The dairy utensils may not be properly washed. All such utensils should be thoroughly washed in luke warm water and then scalded with boiling water or live steam. In any case the milk should be cooled to a low temperature as soon as it is drawn from the cow.

From the foregoing it will be seen that to produce wholesome milk, the health of the cows is important, cleanliness should be observed at all times, all substances likely to carry bacteria should be kept out of the milk, pure water only should be allowed the cows, no foods fed which will give the milk a flavor, the milk should not be left in impure air and it should be cooled immediately to a low temperature as soon as it is drawn from the cow, kept cold during transit from producer ot consumer.

To keep milk in good condition after it is delivered to the home, it must be kept cold until consumed.

The Milk Sediment Test

The quantity of sediment in milk is an indication of the sanitary condition of the milk.

Liquid as well as solid impurities may be present, but if [illegible] present the necessity of pasteurizing the milk form such contamination is at once shown.

The [illegible] tends to appreciate the importance of milk as a food and careless methods in handling may be responsible for the contamination.

The open top milk pail affords opportunity for collecting dirt during the imlking process; this is especially true where no attempt is made to keep the cows clean.

[illegible] are not necessary in the production of milk free from sediment. The open top milk pail together with reasonable care will enable any milk producer to produce milk almost free from sediment.

The sediment test is rapid and simple. It furnishes undisputable evidence of the amount of sediment in each lot of milk. It accumulates in one spot where it may be seen, the amount of sediment contained in one pint of milk, and thus enables the operator to judge approximately, from the appearance of the "disk" the total sediment in the can of milk.

If the milk has not been sufficiently cooled this condition will usually be indicated by the appearance of little clots of dried cream on the "disk". This means loss of cheesemaking material.

Used in connection with the curd test, it makes a combination more effective than the curd test alone.

It places the responsibility on the individual producer and leaves little chance for argument on his part.

Producers with few exceptions take a reasonable view of the test as it is something they can see and understand.

The test not only indicates the better methods of the careful producer, but reveals the shortcomings of the careless one.

Good judgment must be exercised by the operator in making use of the test, offensive comments with-held, and an effort made to get the producer to understand that all that is intended is to point out the facts with a desire of securing his co-operation.

The test is made by straining a pint or about one pound of milk through a cotton disk 1¼ in diameter which is attached to the bottom of the tester. The amount of sediment that collects on the "disk" shows the amount of dirt contained in the pint of milk. The rubber bulb attached to the tightly closed cover is for the purpose of forcing the milk through the cotton filter. After one sample of milk has passed through the tester the cotton disk is removed and placed on a card and a new disk is placed on the wire gauze screen of the tester and another sample of milk put through. The disk may be dried and filed away for reference.

Food Value of Milk

Considering milk from the standpoint of a food, it is found that it contains all the substances necessary to sustain life. When milk is taken into the stomach, the water supplies some of the body fluids. The fat and sugar are the heat and energy producing constitutents of the milk, that is, these two substances when burned in the body keep up the temperature and [illegible] energy. The casein and albumin, the proteids or nitrogenous substances of the milk or the portion of [illegible]—solids which build up the [illegible] muscles. The mineral matter [illegible] up the bones, nails, teeth,

c. Therefore, for the young animal cluding the young child, milk may called a perfect food. This, how- er, is true in the case of the adult ly to a limited extent, because the ult in order to get a sufficient a- ount of food to sustain life for any eat length of time would be forced take into the stomach too much uid. At the same time milk is a irly balanced food rather than mere- a drink. Sweet skimmed milk con- ins the casein, albumin, sugar, ash, d about .1% fat. Sweet whey con- ins the albumin, sugar, ash, and out .25% fat.

Conclusions

1.—The world has never regarded ilk as a real and staple food except r abies and invalids; whereas it is e cheapest of all animal foods and n be consumed in large quantities th directly and indirectly as milk, tter, cheese, cream, buttermilk, im milk, ice ceram, condensed milk, ilk powder. People little realize the oportion of their diet that actually mes from the cow, but this realiza- on is certain to deepen as the war es on.

2—The Indispensability of Milk— ot only will the food value of milk come better understood but its indis- nsability will become better estab- shed as the role of the "vitamines" mes to be better understood. It is t economic to restrict the use of ilk while indulging freely in substi- tes that are not only more costly t less nutritious than the real art- le.

3—The Good Cow—With the in- ease of milk production the value of od cows will be made to stand out never before. With cheap food we il her as a heavy producer but with stly food she will be recognized as economic producer.

4—Milk is nourishing—It builds up e body, keeps it in repair, warm, fur- shes it with energy, contains all the quired elements for growth and aintenance. It is an essential art- le of food. It gratifies the palate, tisfies thirst and hunger and pro- ices, if pure, no ill effects.

One quart of milk at 10c is equal in od value to about 2 pounds of chick- n ocsting 70c, to ¾ pounds of beef eak costing 23c; to 4/5 pounds of rk chops costing 28c.

A glass of milk is claimed to be ual in food value to:

2 eggs,
A large serving of lean meat,
2 moderate sized potatoes,
5 tablespoons full of cooked cereal,
3 tablespoons full of boiled rice or 2 ices of bread.

1 quart of milk contains about 5 nces of solids or
1.5 ounces fat
1. ounces casein (protein)
.28 ounces albumin (protein)
2. ounces sugar (carbohydrate).
.28 ounces mineral or ash.

5—Thousands of children, through e work of the children's Welfare ocieties in the city of Chicago, have en weighed mentally and physically ho have been given the proper a- ount of milk and they have been mpared wtih children, weighed men- lly and physically, who have not re- ived this nutriment and they are own to be far in advance of those ho have not received the proper nount of milk.

6—Science has shown that growing ildren not only require the usual pro- in and carbohydrate foods but that oper nutritious substances must be pplied that their bones may grow d that they must have that unknown otective "something" which is secur- d only in the mother's breast milk or the milk of the dairy cow.

Dr. E. V. McCollum, of John Hop- ns University,, one of the most fam- us scientists on the Continent, has ong with others conducted experi- ents during recent years which ap- ear to prove conclusively that milk d its products contain a vital sub- ance necessary for the growth and evelopment of animals and which is esent to the same degree in few other foods. Experiments with white rats and other animals show conclusively that unless this vital substance which he terms "vitamines" or "Fat Soluble A" and "Water soluble B" is present in the food growth and development is arrested. Quoting from a recent statement he says: "I wish to point out the fact, which rests upon sound experimental evidence that milk is an indispensable article of the diet of any people who wish to achieve; that milk production cannot rest upon a philanthropic basis but must be a paying industry. The public must allow the price of milk to advance to the point where the industry is profitable to the producer. Milk is worth more than its energy value or than its protein content would indicate. It is the great factor of safety in making good the deficiencies of the grains which form and must continue to form the principal source of energy in our diet. Without the continued use of milk, not only for the feeding of our children but in liberal amounts in cookery, we cannot as a nation maintain the position as a world power to which we have arisen. The keeping of dairy animals was the greatest factor in the history of the development of man from a state of barbarism."

Trade Names for Milk

1—MARKET—Intended for direct consumption.

2—RAW—Not treated by heating.

3—PASTEURIZED—Heated to a temperature of 145 degrees to 152 degrees and held at that temperature for 20 to 30 minutes. (May be heated to 180 degrees for 1 minute). Cooled immediately to 45 degrees. The former is known as the "holding method" and the latter the "Flash system of pasteurization."

4—STERILIZED—Heated to a temperature above boiling point. Repeated several times during intervals until "spores" are killed.

5—CERTIFIED—Produced under exceptional sanitary conditions; cows tuberculin tested; bacterial count guaranteed 5 to 10 thousand per c. c. free from disease producing organisms; not pasteurized or sterilized; cooled to 45 degrees immediately after milking; contains 12 to 13% total solids of which 3½% is milk fat; milkers inspected monthly and milk handled under "milk commissions."

6—STANDARDIZED—Fat removed or added as required to bring milk to uniform standard of fat and total solids.

7—CLARIFIED—Passed through cream separator or special clarifier. Dirt adhers to side of bowl.

8—HOMOGENIZED—Forced by heavy pressure through machine called a Homogenizer. Opening through which milk passes very small. Milk passes through discs and strikes "agate" face when the fat globules are broken up so fine that they will not rise. Milk has appearance of being richer than it really is. Sugar usually carmelized by high temperature used if milk is sterilized.

9—MODIFIED—Fat increased or reduced if necessary. Sugar increased. Protein reduced or peptonized.

10—EMULSIFIED—Passed through machine which will mix skim milk powder, saltless butter and water, making a milk containing same proportion of constituents as before previous separation.

11—CONDENSED—Water content lowered by heating in vacuum. Sugar added. In some cases sugar not added.

12—POWDERED—All the water driven off by spraying milk into hot airchamber or passing milk over hot rolls.

13—EVAPORATED—First condensed, then usually homogenized, canned and sterilized.

14—SANITARY—Somewhat indefinite term. Sometimes applied by dealers for advertising purposes while the milk may be produced under insanitary conditions. The term "hygienic" is similarly abused.

Canadian Government

War-Savings Stamps

THE Canadian Government will pay $5.00 each for War-Savings Stamps you own on January 1st, 1924. You can buy these stamps until January 31st, 1919, for $4.00; the purchase price then increases one cent each month.

Buy W.-S. S. at Money-Order Post Offices, Banks, and wherever you see the above sign displayed. Place your stamps on the Certificate provided.

$5.00 for $4.00

THE CERTIFICATE

The Certificate is a pocket sized folder containing 10 spaces upon which to affix W.-S. S. It costs you nothing, and as soon as you have filled one, you are entitled to another. Fill in your name and address in spaces provided.

REGISTRATION AGAINST LOSS

A certificate with one or more W.-S. S. thereon will be registered for you without charge at any Money-Order Post Office. This protects the owner in case such certificate is lost, stolen or destroyed, when on application at the Post Office where certificate was registered, your money will be refunded.

SURRENDER VALUE

If circumstances compel you to realize on your investment, your money is available. The cash surrender value of the stamps at various dates will be found on the back of the certificate. It is very desirable that War-Savings Stamps should be purchased regularly.

THE THRIFT STAMP

In order to make it easier to acquire W.-S. S., you can buy THRIFT Stamps of the value of 25 cents each. These do not earn interest, but 16 of them affixed to a Thrift Card are exchangeable for a W.-S. S. Every man, woman and child should be saving for stamps, as a personal as well as a patriotic duty.

Present and Future Live Stock Activities in New Brunswick

By T. G. Hetherington, B. S. A., Live Stock Superintenent

A summary of the general conditions as they exist in New Brunswick is before the outside reader can fully appreciate the work of the Department of Agriculture in the Province.

This province has never been seriously considered by the outside world as a live stock country, and while it is very true that the province's past performance along the line of live stock production has not been very creditable, yet this does not signify that the possibilities for stock production do not exist. Natural conditions are favorable for a wide expansion, but many conflicting factors have prevented the fulfillment of this possible growth. These might be enumerated as follows:—

(1). The lumber industry. The farmers farm in the summer and lumber in the winter.

(2) Specializing in potatoes, with slight attention to live stock. This practice is general in several of the best agricultural counties of the province.

(3) Extremely poor facilities for marketing stock in any quantity. So far as the farmer is concerned, it is practically a retail trade.

(4) Lack of application of the value of the pure bred sire, i. e., the scrub bull, the scrub hog, the scrub ram and the scrub stallion are all very much in evidence. Farmers are only just beginning to appreciate the value of grading up the farm stock.

(5) A considerable portion of the hay crop is exported.

Suffering from these handicaps it is not particularly strange that advancement has been slow. The country drovers while providing practically the sole outlet for live stock and live stock products, have been a serious hindrance to the promotion of the industry. For instance, their motto has been to get the stock as cheaply as possible, often doubling their money on a single turn-over. This policy, followed up year after year, has led to a general decline in the production of meat and mutton. This narrow-minded policy on the part of the drovers has almost entirely killed the sheep industry. ,

The scrub sire plays a big part in the general scheme of things. The too general use of the scrub has prevented provincial breeders from widening and expanding their business; as a result, the sale of pure bred stock has been slow and at prices scarcely above meat quotations. This has reacted on the quality of the stock bred.

DEPARTMENTAL ACTIVITIES

Sheep

It is generally conceded that New Brunswick is better able, due to natural conditions, to compete with other countries in sheep production than she is in the production of any other class of stock. Consequently this branch has been emphasized. For two years large importations of pure bred rams have been made by the Provincial Department of Agriculture; likewise a considerable number of pure bred ewes and grade lambs.

At the 1917-18 Session of the Legislature a credit scheme for the purchase of sheep was formulated. This provided the machinery so that farmers could purchase twenty sheep and one pure bred ram by paying one-third cash and giving a note for one year at six per cent interest for the balance. This legislation has been a boon to the sheep industry, and along with the departmental propoganda, has given the industry an impetus that we think will tide it over the period of lower prices that are predicted.

In 1917 about fifty pure bred rams were imported for the farmers of the province. The 1918 importation was over three times as large and will have a corresponding effect on the quality of lambs produced another year. The Federal Department of Agriculture has assisted very materially through its policy of paying freights on car lots from place to place, on stock intended for breeding purposes. Likewise, the Federal War Measures Act, for assisting in the purchase of rams, has enabled farmers to secure real high class sires at a reasonable price. Practically all of the rams imported this year from Prince Edward Island were exhibited and winners at the Charlottetown Fair. Forty-nine rams were imported from Ontario and were an unusually high-class lot. The importation of nineteen Cheviot ewes and rams from the State of Maine will provide a foundation stock of this popular and hardy breed for the province.

Co-operative marketing of wool was generally introduced in 1918 and has resulted in the wool growers receiving from ten to fifteen cents per pound more than otherwise would have been the case. This work will be more general next year.

Th eDepartment's plans for the future in relation to the encouragement of the sheep industry are not fully outlined. This winter all of the stock, grade and pure bred, distributed by the Department, will be gone over and treated for ticks and lice; likewise all of the lambs will be docked. In the spring a series of dipping, docking, castrating and shearing demonstrations will be begun. The co-operative marketing of wool will be featured more than ever. In regard to the distribution of stock next year, no fixed policy has as yet been decided upon. However, it is assumed that this year's activities will have created an interest which will cause a steady increase in the grade sheep population. and it is believed that the demand for pure bred rams will be such that little, if any, attention can be given to the distribution of grade stock. Finally, an attempt will be made to discourage the breeding of ewe lambs which is generally practised.

In conclusion, the big darwback—poor facilities for marketing—still exists. The creation of a central abattoir for the Maritime Provinces has been discussed and will possibly materialize. Future developments depens upon the establishment of a central, subsidized abattoir.

Beef and Dairy Cattle

The area suitable for beef production, from a marketing point of view, is much greater than that for dairying. The creation of central co-operative creameries is acting as an incentive to the dairy business.

In the spring of 1918 a Farmers' Co-operative Creamery was established at Moncton and has been a success from the start. Further effort along this line will foster the industry and at the same time will help towards increased production per cow and towards the use of better sires.

The beef trade is local in character, the major portion of the product is utilized by the lumber camps and saw mills. The quality is not what it should be, this having a corresponding effect on the price received. The production of beef is on the increase. Both the dairy and bef interests suffer due to the fact that concentrates are not grown on the farm, likewise it has been clearly demonstrated that corn silage is not a dependable crop.

The Department's activities towards th production of better beef and dairy cattle thus far has been limited to the bonusing of pure bred bulls and the importation of herd sires for the breeders. The system of bonusing pure bred bulls is conducted through the medium of the Agricultural Societies of which thre are upwards of one hundred and seventy-five in the Province. An initial bonus of 20% of the purchase price is granted and succeeding bonuses of 10% of the purchase price for each year the bull is kept by the Society. I feel that this system is faulty, not obtaining the desired improvement and contemplate the fixing of a minimum purchase price and very strict inspection before purchase as well as rigid supervision after purchase. Until this can be done real progress must be slow.

Breeders' consignment sales will be encouraged to the fullest extent. This year the first breeders' consignment sale was held at Fredericton with fairly good results.

Horses

The horse industry has probably received less attention in the past than its importance warrants. Hundreds of carloads of draft horses are imported annually for use in the lumber woods and in towns and cities. The quality of the imported stock has been inferior, Eastern buyers bringing in from the west the low priced stock. Better horses could be produced right at home and a good market is at hand providing the importation of cull stuff can be controlled. This, in a measure, accounts for the backwardness of the industry in the Province.

At the 1917-18 Session of the Legislature a Stallion Inspection and Registration Act was put in force, practically giving the Department control of this phase of the work. Year by year the scrub and inferior pure breds will be eliminated. The yearly inspection gradually becomes more severe. This winter special attention will be given to the interests fo the horse men. It is our purpose to organize a number of Stallion Clubs and to take advantage, in so far as possible, of the Federal Department's assistance in this respect.

Swine

Pork production in New Brunswick as a side-line is not very general. Little has been done in the past along the line of bacon production, due to the lack of a market that demanded this class of product. Farmers depend on the lumber camps as an outlet. This trade demands an extremely fat type of hog.

The Department has established Boys Breeders' Clubs in all the counties of the Province. The boys are provided with a pure bred sow each and one member of the Club is provided with a boar. Improvement is expected from this work. This year about twenty Clubs were organized and the first series of fall pig fairs was held. The interest shown in this movement both by the boys and the parents augurs well for the future of the swine breeding business. In all about two hundred Club bred sows were distributed this year. The financing of these Clubs was looked after by well-to-do citizens of the Province, interested in the development of livestock as well as in the future farmers of the country.

Another reason why the swine industry has not made the advancement it should have, is that the system of pen feeding has been practiced almost exclusively. This year the Department undertook to establish demonstration pig pastures in representative districts of the Province. About fifty of these demonstration plots were established, featuring standard pasture mixtures and in the majority of cases the farmers were well pleased with the experiment. The seed was provided, likewise the necessary fenc-

(Continued on page 203)

The Maritime Seed Fair at Summerside

After a lapse of two years, owing to war-time conditions, the Maritime Seed Fair, annually held at Amherst, N. S., under the auspices of the Maritime Stock Breeders' Association was held in Summerside, P. E. I., on December 11th, 12th and 13th.

The fair was held in Summerside as the Winter Fair buildings are still under the control of the military authorities.

Rev. Dr. P. C. Gauthier was prime mover for a Maritime Seed Fair in 1918. He secured the co-operation of interested officials of the departments of Agriculture of the three provinces at a joint meeting held in the city of Moncton several months ago. The various provinces were anxious to make a good showing of the excellent grains abundantly produced last season. A goodly number of entries were secured but not a few exhibitors as well as the fair management were disappointed by the non-arrival of many of the exhibits in time for the judging, being unnecessarily delayed in transit. The goods forwarded by express arrived in nearly every case in good season, but a portion of the exhibits shipped by freight did not fare so well. This was indeed disappointing to exhibitors who had taken particular pains in preparing their exhibits with a view to a strong effort to beat Island seed grain growers at their own game.

Commenting on the attendance "The Island Farmer" says:—"If Summerside is again to be honored as the place at which to hold next winter's Maritime Seed Fair, it is to be hoped that the sister provinces will allow the fact to be known, when the time comes, and also that more of those interested in good seed will deign to come and see the exhibits, which this year probably constituted, so far as quality is concerned, the finest showing of seeds ever exhibited in Canada. Great preparations were made to accommodate the visitors from Nova Scotia and New Brunswick, who did not come, the visitors from abroad being a mere handful and attending for the most part in an official capacity. There are, of course, still the old war and the old flu, the unpropitious season of the year and some other old excuses to offer; but the fact remains that the attendance was very much poorer, in point of numbers, than it should have been. Some of our country friends were heard to pass some stringent remarks, also, regarding the apparent apathy of our citizens; and we cannot help admitting that such strictures were in a measure justified by the facts. It was, for example, very noticeable that hardly any residents of Summerside attended the public meeting, which was a feature of the Fair and which in other years, when our Seed Fair was only a provincial affair, drew a full house, with some color and vim added to it by the presence of an exceptionally large sprinkling of ladies. This year, so far as we could see, there was only one lady in the audience, and, although it is ungallant to say so, she came in late and sat at the back of the hall as though intruding. In other years we have seen a lot of men standing, because their (or somebody else's) better halves showed such an interest in the proceedings. Now, a sermon to what before the war was considered by some to be the weaker sex is the last thing we ever expected to preach in these columns; but now that our women are going to have the vote and all that they must look to their laurels and manifest a keener interest in the affairs of state.

In general all the exhibits were of a very high order of merit. In quality, in freedom from weed seeds and mixtures of other varieties, and in indications of vitality and vigor, the exhibits at this Fair surpassed those at any previous Seed Fair held in the Maritime Provinces. Some of the exhibits of oats and barley were slightly off color, but this was due to the weather conditions prevailing over the harvest period and did not affect the value of the seed shown for seeding purposes. The exhibits were sent from many different sections of New Brunswick, Nova Scotia and Prince Edward Island and very worthily represented the seed producing possibilities of these provinces.

In the class for members of the Canadian Seed Growers' Association, there were large entries in the oat and wheat sections. In barley and potatoes the number of entries was small. This class was judged by Mr. L. H. Newman, secretary of the Canadian Seed Growers' Association, Ottawa, and Mr. H. S. Cunningham, Truro, N. S. The wheat was of good quality, but a few of the samples contained a small number of weed seeds. These weed seeds could be cleaned out quite easily by a little more care in preparation. Only one or two entries showed mixture with other varieties. The oats were well cleaned, plump, and gave evidence of strong vigor and vitality. More care in grading would have improved some of the samples. The barley was excellent. Potatoes well selected, smooth and free from disease.

The exhibits in the New Brunswick Field Crops class were small, as some of the entries were delayed on the road and did not arrive in time for the Fair. Messrs. J. L. Tennant, Summerside, and T. C. Munn, Inverness, N. S., judged this class. The first prize exhibit in oats was outstanding in quality, very uniform and well graded The wheat was good, the first and second prize samples being very clean and pure. One or two of the exhibits of potatoes were a little rough.

The Nova Scotia Field Crops class was judged by Messrs. O. C. Hicks, Fredericton, N. B., and Gordon McMillan, Cornwall, P. E. I. In wheat there were eleven entries and several samples tested over 62 pounds to the bushel. All the exhibits were of good quality, well filled and graded. With the exception of the first prize sample, the oats were only of medium quality. The potato exhibit was small.

Messrs. T. C. Munn and E. M. Taylor, Fredericton, N. B., judged the Prince Edward Island Field Crops class. There were fourteen samples of wheat representing four varieties. The competition was close and the exhibits showed ogod fair quality generally. Some otherwise good samples were discarded on account of impurities. There was a big class in oats, 23 entries in all, representing both black and white varieties. The general quality was good, there being very few impurities. There were two entries in barly and two in potatoes.

In the general class, the wheat, oats and barley were judged by Messrs. J. B. Andrew, East Royalty, and A. Scales, St. Eleanors, P. E. I. There were ten entries of Banner oats and several of black oats. These were all good. The wheat was excellent, the general quality was good and it was free from impurities. The exhibits of two-rowed and six-rowed barley while small, were of high merit.

Potatoes and small seeds were judged by Messrs. S. J. Moore and F. L. Fuller, Truro, N. S. The potato exhibit deserves special mention. One of the judges stated, "This is the best exhibit of potatoes I have ever yet judged in the Maritime Provinces." The potatoes were shown under type this year, which was a decided improvement. All the entries were first class and there were very few that were not excellent.

There was a big entry of turnip seed, and it was all of excellent quality. In mangel, beet, carrot and cabbage seed, the entries were small but the quality was good. The samples were all well ripened and thoroughly cleaned. The exhibit of root seed demonstrated very clearly the success with which these seeds can be produced in the Maritime Provinces.

The timothy seed generally was good. The first prize lot was very clean and of splendid quality. All the samples were free from serious impurities. There were only a few entries of clover seed. The first prize flax deserves special mention. Beans were a large class and very good. Both white and colored varieties were shown.

The sheaf exhibit was judged by Messrs. J. L. Tennant and Gordon McMillan. This exhibit was well arranged. The first prize sheaf of barley was a splendid sample. The heads were long, uniform and well filled. There were ten sheaves of oats and they were all very good. The first and second prize sheaves were of particularly good quality and well selected, showing neatness and care. Wheat and buckwheat were fair, although the entry was small.

The special sweepstakes trophy, a magnificent silver cup, awarded by the Steel, Briggs Co. of Toronto, to the member of the Canadian Seed Growers Association making the most creditable showing of not more than three varieties of selected seeds, was won by Mr. Richard Creed of Albion. He also won it in 1914.

The silver cup donated by Mr. S. J. Moore, of Truro, for the best selected and best arranged group exhibit of any variety of White Oats was won by Mr. Jas. E. Murphy, Cape Traverse.

The satisfaction expressed by the judges as to the quality of the exhibits was significant, and the Fair in this measure at least, was a success.

Maritime Seed Fair held in Summerside, P. E. I.

An interesting programme had been prepared. On Wednesday the proceedings consisted chiefly of two addresses in the afternoon. Mr. G. E. Saunders, Field Officer in charge of the Dominion Entomological Laboratory at Annapolis Royal, read a very interesting paper on Insecticedes and Fungicides. Following Mr. Saunders, Mr. Arthur Hawke, of the Farmers Agricultural Publishing Co., of Toronto, and who came to the Seed Fair as representative of the United Farmers of Ontario, outlined very interestingly the scheme for establishing a farmers daily paper. Interesting disl cussions and brief addresses followed both of these speakers.

On Thursday at noon the formal opening of the Fair took place, Mr. D. B. McDonald presiding in the absence of Dr. Gauthier. In the absence of the Lieutenant Governor, the Fair was declard open by Hon. Murdock McKinnon, Commissioner of Agriculture. Capt. Jas. Read, M.P., and Mr. F. L. Fuller in brief speeches endorsed the merits of the Fair.

On Thursday afternoon a meeting of the Canadian Seed Growers Association was held. Mr. W. H. McGregor occupied the chair. The programme included addresses by Premier Arsenault, L. H. Newman, S. J. Moore, W. H. McGregor, H. S. Cunningham, J. L. Tumant and E. M. Taylor, These with the discussion which followed, dealt with the various factors relative to crop improvement.

In the evening a public meeting was held which was presided over by Mayor Morrison. The programme consisted of addresses by Mr. Hawkes, Hon. Murdock McKinnon and Capt. Jas. Read, M.P. While the attendance was not large it consisted largely of farmers who were very much interested.

The following is a list of the prize winners:

CLASS 1.
Open to members and applicants of the Canadian Seed Growers' Association

Wheat, Red or White Fife—1st, E. J. Vessey, York; 2nd, Ben C. Jardine, Wilmot; 3rd, Judson Simpson, Belmont.

Wheat, any other variety—1st, Richard Creed, Albion; 2nd, E. J. Vessey; 3rd, Jas. MacDonald, Vernon Bridge; 4th, W. H. McGregor, Lot. 16; 5th, J. L. Cunningham, Bayhead, N. S.; 6th, Elie E. Arsenault, Wellington.

Oats, Banner—1st, J. E. Murphy, Cape Traverse; 2nd, Thos. Waugh, Wilmot; 3rd, W. L. McFarlane, Fox Harbor; 4th, W. H. McGregor, Lot 16; 5th, E. J. Vessey, York; 6th, Richard Creed, Albion.

Oats, Black, any variety—1st, Peter Bradee, York; 2nd, Elie Arsenault, Wellington.

Barley, six rowed—1st, Richard Creed, Albion; 2nd, W. K. McFarlane, Fox Harbor.

Barley, two rowed—1st, J. E. Murphy, Cape Traverse; 2nd, Judson Simpson, Lot 16; 3rd, E. J. Vessey, Little York; 4th, W. H. McGregor, Lot 16.

B

Peas, any field variety—1st, W. H. McGregor, Lot 16.

CLASS 2.
Best half bushel from hand selected seed plot. Open to members and applicants of C. S. G. A.

Potatoes, round white type—1st, Peter Brodie, York; 2nd, Judson Simpson, Belmont; 3rd, W. H. McGregor, Lot 16; 4th, W. W. Fawcett, Sackville; 5th, H. B. Parlee, Sussex.

Potatoes, long white type—1st, Peter Bradee, York; 2nd, E. J. Vessey, York; 3rd, Richard Creed, Albion.

Potatoes, oval white type—1st, Peter Bradee, York; 2nd, E. J. Vessey, York; 3rd, W. W. Fawcett, Sackville; 4th, Ben C. Jardine, Wilmot.

Potatoes, Rose type—1st, Peter Bradee, York.

Potatoes, any dark skinned variety—1st, Peter Bradee, York; 2nd, W. H. McGregor, York; 3rd, H. B. Parlee, Sussex.

CLASS 3
Open to all competitors in the Field Crops Competition in New Brunswick. Winners are expected to exhibit

Wheat—1st, H. B. Parlee, Sussex; 2nd, Henry Gordon, Chatham; 3rd, Francois O. Richard, Bretagneville; 4th, Cleopa Barrian, St. Ignace.

Oats—1st Henry Gordon, Chatham; 2nd, Cleopa Barriau, St. Ignace.

Potatoes—1st, Henry Gordon, Chatham; 2nd, W. W. Fawcett, Sackville; 3rd, Harold Hartley, Woodstock; 4th, R. R. Semple, East Florenceville.

CLASS 4
Open to all competitors in the Field Crops Competition in Nova Scotia. Winners are expected to exhibit.

Wheat—1st, A. B. Cunningham, Tetamagouche; 2nd, W. L. McFarlane, Fox Harbor; 3rd, Jno. R. Harrison, Maccan; 4th, Jas. E. Coady, Margaree Forks; 5th, Alex. Chrisholm, W. Grant; 6th, J. L. Cunningham, Bayhead; 7th, Samuel Freeman, Amherst; 8th, Jno. McMullen, Georges River.

Oats—1st. Alex. Chisholm, North Grant, Antig. Co.; 3rd, J. L. Cunning- Farm
ham, Bayhead; 5th. J. L. Grant, Antigonish; 7th, Wm. Oli Selma.

Potatoes—1st, Alex. C. Chisholm, North Grant, Antig. Co.; 2nd, Jno. McMullin, Georges River, N. S.

CLASS 5
Open to all competitors in the Field Crops Competition in P. E. I. Winners are expected to exhibit.

Wheat—1st, E. J. Vessey, Little York; 2nd, Geo. McFarlane, Bedeque; 3rd, Edgar Gledding, Abney, Lot 64; 4th, Denis O'Brien, Elmsdale; 5th, Gordon McMillan, North River; 6th, Cornelius McLellan, Arlington; 7th,

. J. McLellan, Grand River, Lot 14; th, J. MacDonald, Vernon Bridge.

Oats—1st, E. J. Vessey, Little ork; 2nd, Geo. McFarlane, Bedeque, rd, R. H. Raynor, Cascumpec; 4th, ay McLean, Lot 16; 5th, J. B. McMil- n, Long River; 6th, A. J. McDonald, rand River; 7th, Jno. J. Gallant, Tig- ish; 8th, Edgar G. Glidding, Abney, ot 64.

Barley—1st, E. J. Vessey, Little ork; 2nd, Cornelius McLellan, Ar- ington.

Potatoes—1st, E. J. Vessey, Little ork; 2nd, Mont Annear, Montague.

CLASS 6

Open to exhibitors not eligible for classes 1, 2, 3, 4 and 5.

Wheat, White Fife—1st, E. L. Mill- s, Central Lot 16; 2nd, L. C. MacDon- ld, Grand River, Lot 14.

Wheat, White Chaff—1st, Calvin W. Wood, Charlottetown; 2nd, J. C. erry, DeBlois; 3rd, Thos. Waugh, Vilmot; 4th, Geo. W. Wood, Hazel- rook; 5th, A. B. McFarlane, Bedeque.

Wheat, White Russian—1st, W. H. . Cooke, York; 2nd, Jno. R. Harrison, laccan; 3rd, Henry Gordon, Chat- am.

Wheat, any other variety—1st, J. R. larrison, Maccan; 2nd, Calvin W. Wood, Charlottetown; 3rd, Geo. W. Wood, Hazelbrook; 4th, Reuben arge, Wilmot; 5th, Henry Gordon, hatham.

Oats, Banner type—1st, Alex. C. hisholm, North Grant; 2nd, Fred G. ompton, St. Eleanors; 3rd, Percy larchbank, New Annon; 4th, J. R. larrison, Maccan; 5th, Hebert Agnel, Vilmot.

Oats, any white variety—1st, E. J. essey, Little York; 2nd, J. R. Harri- on, Maccan; 3rd, Jno. J. Gallant, Tig- ish; 4th, Henry Gordon, Chatham; th, Peter Bradee, York.

Oats, any black variety—1st, Al- honsus McLellan, Arlington; 2nd, E. . Vessey, Little York; 3rd, R. H. Ray- or, Cascumpec.

Barley, six rowed—1st, E. J. Vessey, ittle York; 2nd, Calvin W. Wood, harlottetown.

Barley, two rowed—1st, J. R. Harri- on, Maccan; 2nd, W. H. P. Cooke, ork; 3rd, W. S. Hugh, Murray Har- or; 4th, Alex. Anderson, Bedeque; th, Jas. H. Arsenault, Urbainville.

Buckwheat, smooth variety—1st, E. Vessey, Little York; 2nd, Laura rthur, Summerside; 3rd, Alex. An- erson, Bedeque; 4th, L. C. MacDon- ld, Grand River.

Buckwheat, rough variety—1st, J. . Murphy, Cape Traverse.

Field Peas, any large variety—1st, . R. Harrison, Maccan; 2nd, Wm. lie, Selma, N. S.

Flax Seed—1st, Arsene Gallant, iscouche; 2nd, Halden Compton, St. leanors; 3rd, Robt. Gaudet, Mis- ouche.

Vetches—1st, Theo. Ross, Bedeque; nd, D. A. Nickolson, Albany.

Timothy Seed—1st, J. A. Murphy, ape Traverse; 2nd, J. R. Harrison, laccan; 3rd, W. S. Hugh, Murray larbor; 4th, Geo. McFarlane, Bed- que.

Clover Seed—1st, S. R. Carons, reetown; 2nd, J. A. Murphy, Cape raverse.

Turnip Seed—1st, J. E. Murphy, ape Traverse; 2nd, Horace Wright, edeque; 3rd, Geo. McFarlane, Bede- ue; 4th, J. J. Dunn, Lower River; th, H. O. Gallant, St. Christome.

Mangel Seed—1st, Hebert Arsen- ult, Urbanville; 2nd, Albert C. Ver- iotte, West Northfield; 3rd, Horace Wright, Bedeque; 4th, J. E. Murphy, ape Traverse.

Beans, any white variety—1st, E. S. allant, Caissie; 2nd, H. B. Parlee, ussex; 3rd, H. O. Gallant, St. Chris- ome; 4th, H. S. Arsenault, Urban- ille.

Beans, any colored variety—1st, H. . Gallant, St. Christome; 2nd, E. S. allant, Caissie; 3rd, Wm. Olie, Sel- a; 4th, J. R. Harrison, Maccan.

Eschalots—1st, Mrs. H. W. Comp- on, St. Eleanors; 2nd, Mrs. Phileas audet, Miscouche; 3rd, W. D. Comp- ton, N. St. Eleanors; 4th, Hebert Ar- senault, Urbanville.

Onions—1st, Mrs. H. W. Compton, St. Eleanors; 2nd, W. D. Compton, St. Eleanors.

Carrot Seed—1st, Albert C. Veniotte, West Northfield, N. S.; 2nd, Hubert S. Arsenault; Urbanville.

Beet Seed—1st, H. S. Arsenault, Urbanville; 2nd, Thos. Waugh, Wilmot; 3rd, D. A. Nickolson, Albany; 4th, H. Wright, Bedeque.

Cabbage Seed—1st, E. J. Hogg, Sherbrook; 2nd, Thos. Stuart, Summerside; 3rd, H. S. Arsenault, Urbanville.

Potatoes, round white type—1st, Henry Gordon, Chatham; 2nd, E. J Vessey, Little York; 3rd, Walter Warren, Marshfield; 4th, W. H. P. Cooke, York; 5th, J. H. Arsenault, Urbanville.

Potatoes, oval white type—1st, W. H. P. Cooke, York; 2nd, W. H. D. Vessey, York; 3rd, Walter Warren, Marshfield; 4th, J. A. Lawson, Bedeque; 5th, J. J. McLellan, Grand River.

Potatoes, long white type—1st, W. H. P. Cooke, York; 2nd, J. H. Arsenault, Urbanville; 3rd, E. J. Vessey, Little York; 4th, Henry Gordon, Chatham; 5th, Arsene Gallant, Miscouche.

Potatoes, Rose type—1st, E. J. Vessey, Little York; 2nd, Arsene Gallant, Miscouche; 3rd, G. Gallant, Miscouche; 4th, J. H. Arsenault, Urbanville; 5th, Cornelius McLellan, Arlington.

Potatoes, red skinned variety—1st, Peter Bradee, Little York; 2nd, E. J. Vessey, York; 3rd, W. H. P. Cooke, York; 4th, Walter Warren, Marshfield; 5th, C. Perry, DeBlois.

Potatoes, dark skinned variety—1st, E. J. Vessey, Little York; 2nd, W. H. P. Cooke, York; 3rd, J. H. Arsenault, Urbanville; 4th, Henry Gordon, Chatham.

Potatoes, McIntyres—1st, E. J. Vessey, Little York; 2nd, J. E. Murphy, Cape Traverse; 3rd, Ashley Murray, Summerside; 4th, J. J. McLellan, Grand River, Lot 14; 5th, W. H. P. Cooke, York.

CLASS 7

Sheaf exhibits open to all

Wheat—1st, W. H. P. Cooke, York; 2nd, E. J. Vessey, Little York; 3rd, Geo. McFarlane, Bedeque; 4th, E. L. Miller, Central, Lot 16.

Oats—1st, Richard Creed, Albion; 2nd, J. E. Murphy, Cape Traverse; 3rd, Geo. W. Ward, Hazelbrook; 4th, Hubert Agnew, Wilmot.

Barley—1st, Richard Creed, Albion; 2nd, E. J. Vessey, Little York; 3rd, W. L. McFarlane, Albion; 4th, Calvin W. Wood, Charlottetown.

Buckwheat—1st, Richard Creed, Albion; 2nd, Jas. E. Murphy, Cape Traverse.

CLASS 8

Special Sweep-stakes Trophy.

Awarded by the Steel Briggs Seed Co., Toronto.

For the member of the Canadian Seed Growers' Association making the most creditable showing of not more than three varieties of selected seed. This trophy not to be the permanent property of any grower until won by him three times. Won in 1910 and 1911 by Robert McKay, Millsville, Pictou Co., N. S.; won 1912 by W. H. McGregor, Central, Lot 16, P. E. I.; won in 1913 by W. L. McFarlane, Fox Harbor; won in 1914 by Richard Creed, Albion, P. E. I; won in 1915 by W. L. McFarlane, Fox Harbor; won in 1918 by Richard Creed, Albion, P. E. I.

CLASS 9

Silver cup donated by S. J. Moore, Truro, for the best selected and best arranged group exhibit of any variety of White Oats. Cup to be won three times before becoming property of the exhibitor. Won in 1913 and 1914 by J. A. McDonald, Maryvale, N. S.; won in 1915 by W. L. McFarlane, Fox Harbor; won in 1918 by Jas. E. Murphy, Cape Traverse.

Some Minor Benefits of Co-operation

By H. S. Shaw

The majority of the arguments for Co-operation are so well known that they hardly need to be mentioned in these days. Its general benefits have been so well discussed by a multitude of writers and speakers that the only article dealing with co-operative matters which will prove interesting to the general reader, is one citing examples of successful associations.

And yet there are a few of the advantage sof co-operation among farmers still calling for emphasis in any appreciative notice of the movement which is gaining ground so rapidly among us, and first it ought to be observed that one of the chief advantages of co-operation is the convenient and economical distributing centre which it provides, both for the products of the farm as well as for the supplies which it must continually purchase.

It is doubtful if many appreciate this advantage as they should. In earlier days the farm itself formed the only distributing point for the produce of the farm. What was raised for sale had to be taken to market directly from the farm, whether it was far or near, and there disposed of to the best possible advantage. Such a method was generally expensive as well as laborious, as many of our older farmers will remember.

A little later in the history of Agriculture, the country store became the centre of distribution for the products of the farm; while still later the speculator appeared on the scene and tried to perform the same office for the farmer. These methods have all proved too expensive and have been quite generally abandoned among all progressive farmers for the co-operative method. With it's central warehouse where all the products of the farm are received, properly graded and packed, Co-operation attends to distribution in a most economical and every-way satisfactory manner.

Likewise to this central point are gathered the various supplies which the farmer needs, such as feed, fertilizer, spraying material, seed, etc. This method of distribution is proving one of the very attractive features of Co-operation, providing in addition, cheap and safe storage, adequate insurance against all loss, economy of time and labour.

Again Co-operation provides the farmer with capable management in the conduct of his ordinary business affairs.

All over our country are to be found many failures on our farms which were entirely preventable. Now these failures were due not to a lack of energy on the patr of the occupant fertility, but solely because the farm are poorly located or lack natural fertility, but solely oecause the farmer was lacking in good business ability. These men have failed simply because they were unable to dispose of their crops profitably or to purchase their supplies on the best markets.

This has not always been the fault of the farmer himself, but more often of his circumstances. Marketing requires not only special ability, but also much time and thought, and these last the farmer can ill afford.

Agriculture in these days is not only a laborious operation, but it demands a continuous expenditure of intelligent thought that little or no energy or time is left to attend to the marketing end of the business. It is just at this point that co-operation serves a most useful purpose. Each Association engages a successful business man who as manager gives his whole time of such of it as the business demands, to the work of marketing the products brought to the warehouse, as well as purchasing the supplies which are needed on the farm.

It also transpires that the manager becoming in time a sort of confidential business adviser to each member, often by his wise counsel saving him from many an unsafe venture.

But Co-operation is also a strong aid to greater production. Success in farming depends upon production, for the farmers income is in proportion to what sells. Hence, if he has nothing to sell he will have no income. In the days of reconstruction which are close upon us, there will be no other resort but increased taxation, a large burden of which will undoubtedly fall upon the farmer. The farm then will not only be obliged to produce as it has, but also additionally, to meet the extra burden of increased taxation.

General world food shortage is also an added call for greater food production. The fearful destruction in both men and natural resources, caused by the late war, has brought a large portion of Europe to the very verge of famine conditions. To meet this old world shortage of food, Canada must put forth greater efforts than ever to produce next yeár a record crop. In accomplishing this patriotic as well as humanitarian duty, the farmer can rely upon no more helpful ally than the Co-operative Association. By attnding to the business end of farming, Co-operation releases a vast amount of energy and intelligence which can be devoted solely to production.

But further, Co-operation encourages better farming. Co-operation brings the farmer into close touch with the consumer from whom he learns that a first class article is always to be preferred, commanding as a rule a better price. Thus encouraged, the farmer is bound to give more attention to the preparation of his seed bed in the spring. He will make a much more liberal application of fertilizer, give more attention to cultivation, spraying, as well as all other operations necessary to producing not only a large crop, but one of good quality. Since co-operation became more general, there has been a marked tendency towards better farming—a tendency which is bound to increase as time advances.

Such are a few of the advantages of co-operation, which are not mentioned in the ordinary article on Coly worthy of notice with those more commonly enlarged upon.

TO BE KNOWN AS CANADIAN NATIONAL RAILWAYS

A circular has just been issued over the signature of the President, Mr. D. B. Hanna, announcing that effective January 1st, 1919, all Government Railway Lines, heretofore known as Canadian Northern Railway System, including its eastern and western lines, and Canadian Government Railways, composing the National Transcontinental Ry., Intercolonial Railway of Canada and the Prince Edward Island Railway, will hereafter be known and operated under the name "Canadian National Railways," the headquarters of which will be in Toronto.

All officers of the system are requested to use the name "Canadian National Railways" in the course of operating correspondence and general conduct of affairs. It is also desirable that the public and the railway's connections adopt and put into practice at once the new title in addressing communications, reports and general correspondence to the various officers of the Canadian National Railways."

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given,

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

DATES OF ISSUE

January 7-21
February 4-18
March 4-18

JANUARY 7, 1919

The management and editors of the Maritime Farmer wish its readers a very Happy and Prosperous New Year.

* * *

1919

The new year, 1919, has arrived. The four preceding years were ushered in under the pall of war clouds. They were strenuous years—years that brought anxiety, death and sorrow to many of our Canadian homes. Now there is a rift in the clouds and humanity sees a glimpse of the silver lining.

As soon as the opening of hostilities was heralded and the call to arms in August, 1914, the Maritime Farmer sent out the first clarion call in Canada for the urgent necessity of Increased Production of food products. During the intervening years the farmers of the Maritime Provinces and all Canada have nobly answered the call. In no year was this more evident than in 1918. The men in the second line of defense on the farms, in many cases working against great odds, accomplished wonderful results during the spring and summer, by working early and late in an honest effort that the men in the Empire's first lines of defence might not go hungry. Their efforts were crowned with success and there is food a-plenty and thanks to Divine Providence and our soldiers and sailors there is peace.

But the demands for food to feed the destitute nations, until such a time as they will be able to bread themselves, as heretofore, is going to keep our food supplies at a low ebb. Surplus supplies will rapidly diminish and consequently the necessity for a continuance of effort to produce as much food as possible, is just as urgent for 1919 as it was during the year just closed.

The readers of the Maritime Farmer are alive to the situation and may be relied upon to put forth every atom of earnest effort to do what is right by their Empire. They have proved equal to the occasion when the call "to arms" was sounded and will not be found wanting in any feature of the reconstruction period in which they can shoulder a share of the burden.

YEARLY TEST—AUTHENTIC MEASURE OF COW

The work a cow does in her life is her true measure. Every breeder appreciates the cow that reproduces regularly; the one that produces milk for eight or more lactation periods and transmits to her offspring the same powers. It is not enough that a cow make two or three good records, especially for a week or thirty days. Constant yearly production, the average production for a series of years, even though it be not phenomenal, is what should be demonded of the dairy cow.

It is well enough now and then to prepare a cow for a big record by permitting her to rest for a long time and to feed her heavily during this resting period, that she may be fattened. The record made by such fitting does not measure the inherent and steadfast qualities of the cow. It simply shows what can be done with feed and skilful handling. The cow selected for such a test is usually well bred or she could not do her part. This system of handling cows has had its advantages, for it has demonstrated clearly the importance of good feed and right handling.

We are not unmindful of the harmful practice of permitting a cow to loaf the larger part of the year in order to make her fat and then force her by various schemes and methods to make a large record soon after she freshens. This system has taught us certain lessons which are valuable, but there is little to be gained by continuing this practice. The scientists have shown us through their investigations the effects certain feeds have upon the development and function of the animal. Every breeder who desires to develop a cow of large and steadfast production and capable of reproducing herself regularly, has been interested in the results obtained through certain feeds.

Enough work has been done to lead every thinking breeder to believe that with the right mixture of feeds our cattle will not only grow in producing qualities and reproduce more regularly, but the number of lactation periods will be extended. There must be a true conception of what constitutes the real measure of a cow and a thorough understanding of the factors influencing her development before the greatest progress in breeding can be made.

A WORD TO MARITIME BREEDERS

Breeders of pure bred live stock in the Maritime Provinces find that when they have good livestock—the kind they can honestly recommend—for sale, a timely advertisement in the columns of the Maritime Farmer will put them in touch with prospective buyers. The Maritime Farmer numbers among its present day clients breeders who have been persistent and consistent advertisers in its columns for over twenty years—a sound proof of the fact that they find it a paying proposition.

For over twenty years the Maritime Farmer has reported the exhibitions and fairs held in Maritime Canada. A full list of live stock prize winners is published in connection with these reports, consequently non advertisers have been given just as much publicity as have the advertisers. This publicity has put hundreds of dollars into the hands of breeders who have never spent any money for advertising in our columns.

A very small outlay will purchase a regular space in each and every issue of the Maritime Farmer. Or the advertisement may be arranged to appear at stated periods. A yearly advertisement is, however, the best proposition, as the breeders' name is kept regularly before the public.

Then, there the columns reserved for very small advertisements at the very low rate of two cents per word with a minimum charge of twenty-five cents. Thousands of dollars worth of live stock, farm produce and other articles annually change hands by purchase, sale and exchange through the publicity of our two cents per word advertisements.

Sometimes a breeder does not wish to carry an advertisement all the year or yet use a great deal of advertising space transiently. This class will find a line in our Breeders' Directory a paying investment. A line of this nature costs only two dollars per year, a trifle over eight cents per issue.

Any breeder of cattle, horses, sheep, swine or poultry who is in the field to produce and sell surplus stock of quality, should not depend on free publicity. It only costs a trifle to keep prominently before the public.

The Maritime Farmer has given a great deal of free service. Our advertisers and readers appreciate what has been done along this line. We wish to pass the word along to the breeders who do not advertise but who have benefited by the publicity received through Maritime Farmer reports that we expect and will appreciate the reciprocity of their patronage to the extent of at least an order accompanied by two dollars to have their names inserted in our Breeder's Directory for the ensuing year.

We will be pleased to publish items of interest in regard to purchases and sales or exchange of live stock, free of charge, for any advertiser in the columns of The Maritime Farmer. We invite our breeders to make full use of this offer. The Maritime Farmer is anxious to be of service to its patrons. We can help you and you can help yourself by furnishing information regularly. We do not wish, however, to assist only those who have honest value for sale.

A WORD TO OUR READERS

The Maritime Farmer has always aimed to publish timely, practical advice of the helpful kind and confine this advice to such matters as are applicable to Maritime Province conditions. We wish to also give full and free publicity to any movement that has for its aims and object the betterment of conditions in any specific line in our three provinces by the sea.

There are many instances of success along lines of stock breeding and general farming annually transpiring in every locality of Maritime Canada, but which are never made public.

The Maritime Farmer will always be pleased to receive short stories of matters of this kind We invite our readers to co-operate with us in bringing the best accomplishments of our farmers that show our Maritime possibilities to the attention of the public. Co-operation of this kind will show our young men at home, as well as others who may be looking for a country in which to cast their lot during the reconstruction period, just what can be accomplished in good old Nova Scotia, Prince Edward Island and New Brunswick. Let us hear from you.

* * *

After the farm implement has been thoroughly overhauled and repaired at this season of the year, it should be given a good coat of paint. If the old paint is gone or badly worn, it is advisable to apply a coat of linseed oil with a small amount of paint as a first coat. After this has thoroughly dried a second coat can be applied over the entire machine.

PRESENT AND FUTURE LIVE STOCK ACTIVITIES IN NEW BRUNSWICK

(Continued from page 199)

ing and with the understanding that if continued for a period of years the fence provided would become the property of the farmer.

Future effort towards the encouragement of the swine industry will mainly be through attention to the Pig Clubs, assistance along the line of demonstration pig pastures and the importation of pure bred stock for the farmers.

Summary

The stock industry in this Province is just at the point where real advancement could be made—an expansion on a wholesale scale cannot be brought about unless the facilities for marketing are available. The farmers are keenly interested but must be assured of an outlet. Departmental activities, no matter how vigorous, cannot overcome this, and at the same time much of the Departmental work will bear little fruit unless this condition is remedied.

Much is expected from the Club movement in sheep, pigs and stallions. The attitude of the farmers towards better stock was never better. A Provincial Livestock Association is in the process of organization, progressive men are behind it and this is bound to be a big factor towards the promotion of more and better livestock.

ECHOES FROM THE NOVA SCOTIA DEPARTMENT OF AGRICULTURE

AT THE N. S. A. C.

Owing to the influenza situation, the winter session at the College of Agriculture did not open until Dec. 4th last. In order to make up some of the time that was thereby lost, the Christmas vacation at the College will only extend from Dec. 24th to Dec. 30th, and the next session will open on Tuesday, Dec. 31st. Mainly owing to the influenza outbreak, hardly more than half of the students who had originally applied for entrance, reported at the College at the opening of the College term, but a few have applied to join the classes after they re-open on Dec. 31st, and in most cases will be granted the opportunity. The number actually in attendance in the regular classes at the College this year is 35, which is just about one-third of the attendance in pre-war time. This number is supplements by a class of 12 returned soldiers, whose numbers will be largely supplemented after Christmas.

Although the attendance for the current year is one of the smallest in the history of the institution, there are a considerable number of applications already received for entrance for the term beginning in Nov., 1919, at which time, under peace conditions and when, it is to be hoped, the influenza epidemic will be over, normal conditions will be resumed.

The Short Course at the Agricultural College, which was advertised to be held during the first two weeks of January, has been postponed and will not likely be conducted until March. While the influenza at Truro, the site of the College, is well in hand, yet there are many parts of the Maritime Provinces, from which students usually come to the College, where the epidemic is still serious. For this reason it was felt wise to postpone the Short Course for a time, in the hope that by the beginning of March more normal conditions might prevail and that consequently the usual large classes would convene again. When the date of the Short Course is finally settled upon, full announcement will be made in our columns.

CROP REPORT FOR 1918

The 1918 Crop Report issued by the Departments of Agriculture and of Industries and Immigration, is much more comprehensive than previous reports and deserves special comment. For the first time in the history of the Province, estimates are given by counties of the various crops grown, and the numbers of live stock of all kinds in each. It is true that these are only estimates but the Departments have in some particulars actual figures which will demonstrate the reliability of their information. A very good idea can thus be obtained of the relative standing of the various counties in the matters of agriculture.

In summing up results, the authors state that the hap crop is some 20% below the average. This shortage is more serious because no surplus has been carried over from the previous year. None the less farmers will probably have sufficient hay for their own use, except in a few localities where the supply habitually falls short. So it is anticipated that there will be no famine in hay but only a rather troublesome shortage. As an offset to this there is a liberal increase in oats and other cereals. The Province has 20% more grain than last year. With careful use of the hay on hand, supplemented by the heavy straw crop, the outlook is not as bad as many feared.

Copies of this interesting report may be obtained from the Secretary for Agriculture, Truro, N. S.

AN INTERESTING COMMENT ON THE LAW OF AVERAGES

The Nova Scotia Crop Report for 1918 furnishes a good example of the law of averages. Some 350 correspondents scattered over the Province report as accurately as possible on various crops, live stock, etc. The Department proceeds on the assumption that the average of these reports will be near the truth. The corrections of this judgment is demonstrated in the following paragraph, which first sets forth the estimates furnished by correspondents, and then checks these up against actual figures compiled from the Creameries by the Department.

"This is the first season for a number of years that we have to report no increase in dairy products. The average of the reports from all correspondents indicates 100% of butter in comparison with 100% last year, and 96% of cheese in comparison with 100% last year. As corroborative, definite figures to support this report, the exact returns from the creameries, plus an estimate for the month of December aggregates 1,800,000 lbs. butter in comparison with 1,760,871 lbs. in 1917. There were 11 more patrons. The figures for 1917 being 4289 and for 1918 being 4300. The value of the butter and cheese, due to increased prices, was 10% over 1917. Several matters accrued for this lack of increase in output, shortage of labour, shortage and high price of feeds and, most important of all, according to the Dairy Superintendent, a lack of cow testing, which in turn was partly due to lack of labour."

THE HAY SITUATION

It is unusually difficult this year to estimate the hay situation. The Nova Scotia Crop as a whole seems to have been at least 25% below the average, although many farmers have bigger crops than last year. At the present time, it is practically impossible to buy at the points where hay is usually for sale. To what extent this is due to an actual shortage, or, to a wise policy on the part of farmers in ensuring enough for their own use before selling, is a question which officials of the Department of Agriculture are trying to determine, but exact information is difficult to obtain.

A year ago there appeared to be a serious shortage in wheat and oats in N. S. After a careful survey, the Department estimated that there was a very limited quantity of seed oats and wheat in the Province, and advised merchants to buy heavily, at the same time adopting a policy whereby they would be guaranteed against loss on account of any unsold surplus. It transpired later that farmers were fairly well supplied with seed, and many thousands of bushels of wheat and oats imported for seed were consumed for food.

The situation may be the same with regard to hay. A year ago Nova Scotia had a heavy crop and farmers sold and used hay with little caution. This year the reduced crop has led to conservation and the final result may be more abundant supplies next spring than last.

This statement is being sent out to the pres s in the hope that it may lead to further publicity on this question, and give opportunity to bring in, if they are to be had, the supplies of hay needed in N. S.

FEEDING DAIRY CATTLE

The amount of bran, middlings, and cottonseed meal now on the market falls so far short of the requirements that the farmer has grave difficulty in properly feeding his cows. To meet this situation the manufacturers of proprietary or mixed feeds have put forth great commendable efforts to stock the market with their products. In addition to these there is to be had a certain amount of wheat screenings and special screenings,—mostly weed seeds by the way, but nonetheless good feed when ground. The only feed offered in any quantity that is rich in protein is linseed, or oil meal, Linseed meal is an extremely valuable feed and may be used with good results instead of cotton seed meal.

The Secretary for Agriculture for Nova Scotia, anticipating an acute shortage in the standard feeds, arranged early with the big dealers in New York and Ontario to place a considerable amount of this meal in N. S. This action has already resulted in many dealers and Farmers' Associations being able to buy linseed meal at a fair price. If the demand justifies it, further quantities may yet be obtained, although the Armistice conditions have already resulted in large purchases by Great Britain, Denmark and Holland, in which countries this feed is valued very highly and as a result market prices have increased several dollars per ton.

THE OUTLOOK FOR DAIRY PRODUCTS

Many city and town folk have been looking anxiously for lower prices on butter, cheese and milk. To these the prospects are disappointing. A rather startling fact is brought out in the Crop Report for 1918, recently issued by the Department of Agriculture for Nova Scotia. It is there indicated that, for the first year, in more than a decade, this Province has made no precepible advance in dairy production. The actual figures from creameries for eleven months, plus an estimate for December, show an increase of eleven patrons and a production of 2% more butter than in 1917. In some former reports a 50% increase in a single year has been recorded. This year's figures are yet more significant when we take account of the fact that farmers had the additional stimulus of a 15% increase in prices.

People who are conversant with the situation recognize at once two great reasons why the Nova Scotia farmers have failed to increase the products of the dairy. One is the shortage of labor; the other the high cost and the difficulty of obtaining at any price of mill feeds.

City people in general do not realize the extent to which these feeds have increased in price. Bran and middlings before the war could be bought for a little over $20.00 per ton, now they are hardly obtainable at from $42.00 to $50.00.

The facts in the whole situation indicate a double inference. On the one hand, it has become necessary for farmers to produce their own feeds. This is easily said and difficult to do in the present circumstances. An increase of production in feeds required additional labor and additional outlay for fertilizers of which the price has increased even more than that of feeds mentioned. Yet the farmers themselves admit that this is the only way to a solution of the feed question. On the other hand the city consumer must remember that this can only be done, and the supply of dairy products maintained, on the basis of the high prices upon which he now looks with suspicion.

A CINCH IN PURE BRED SHEEP

The Nova Scotia Dept. of Agriculture, in co-operation with the Federal Dept., purchased in Ontaria and various other points over three hundred pure bred, registered rams, and a considerable number of pure bred, registered ewes. This stock was brought to the College of Agriculture, at Truro, and a large number of animals have been disposed of at auction or by private sale. Experts who looked over these state that they were the finest consignment in the sheep line that ever came to Nova Scotia. It should prove the means of substantially improving many N. S. flocks, and of adding to the returns in this most profitable branch of stock raising.

MODEL ORCHARDS

It may not be generally known to the public of N. S., that the Provincial Dept. of Agriculture has at different times since 1900 set out some 30 Model Orchards in different parts of the Province. Of this number some have, through adverse circumstances, practically gone out of existence. The majority are still in first class condition and doing good work.

The terms upon which the Dept. undertakes the setting out and over sight of such an orchard are in general such as to ensure that it shall be as far as possible a public institution, conducted in the interest of the district in which it is located. The specific objects aimed at are the finding out of the possibilities of fruit raising in different parts of the Province, the testing of varieties as to their adaptability to the locality, and the demonstration of the best and most up to date methods in caring for and improving an orchard. The Dept. furnishes free nursery stock and a certain amount of spraying materials, and offers expert assistance in the operation of spraying, pruning and grafting. The Provincial Legislature limits the number of these Model Orchards to three in any one county, with a total acreage per county of not more than six acres. Cumberland, Cape Breton, Guysborough, Hants and Yarmouth are some of the counties which are at present not fully occupied.

COTTON SEED AND LINSEED FEEDS

Numerous inquiries are being received by the Dept. of Agriculture from dealers and farmers as to the possibility of cotton seed meal coming to Nova Scotia. The Washington Administration up to date has permitted only a few hundred tons to be exported to Canada, all of which went to the mills of Upper Canada to be compounded with other materials in making up the proprietary feeds, with which farmers are now becoming familiar. A communication received by the Secretary for Agriculture from Ottawa this week expresses the hope that export licenses for small quantities may be obtained, but this is not yet certain.

In the meantime those who have used cotton seed are using linseed meal of which 100 cars have been sold in the Province since midsummer. Foreseeing the difficulty of obtaining

HORTICULTURE.

SOIL MANAGEMENT INVESTIGATION IN A YOUNG APPLE ORCHARD

Te object of this investigation (carried on in Laurel, Indiana) ha been to study the effects, and particularly the factors responsible for the effects of tillage with cover crop, mulch, and sod on apple trees. The present report covers the formative period of the life of the trees. The land ocmprising the experimental plots had been used as a permanent pasture for neary 40 years previous to planting the orchard. The investigation has to do mainly with the upland area, the hillside plot being included for any additional light it might throy on the behaviolr of the upland plots. The systems of soil management include four major treatments, viz., clean cultivation with a winter cover crop; ;a heavy mulch of straw applied to the trees, and the grass cut and let lie; the grass cut and allowed to lie where it falls, no mulch given the trees; the grass cut and raked up to form a mulch collar about the trees.

The Laurel soil contains a high percentage of silt and clay, and varies but little in its physical composition, specific gravity, and water-holding capacity. The soil (to a depth of 9 in.) is not notably deficient in any essential element, however it is not very productive. The low organic matter content and the high proportions of silt and clay, make the soil one through which water percolates slowyl and the one which is easily puddled; coupled with these conditions is a slight acidity. The subsoil is not greatly different from the surface soil.

The average annual precipitation during the five-year period, 1912-1916, has been 38.71 in. The spring months are usually much better supplied with moisture than the autumn months. periods of dry weather frequently prevai lin June and July, which are commonly broken by heavy precipitation in August.

While there have been no wide variations in phenological behavior of trees under different systems of soil management, yet there does occur a marked slacking up of growth on grass plots during dry periods in summer.

Trees grown under a clean culture cover crop system or under a heavy mulch made 44.5 per cent. greater average yearly gains in trunk girth than trees grown in grass with a light mulch or no mulch at all. There was no significant difference between the three varieties, Grimes, Jonathaan and Stayman in their respanse to soil management treatments. The Stayman variety made slightly greater gain in girth of trunk on all plots than did the Grimes or Jonathan.

It is largely in dry periods that the value of certain systems of management in conserving soil moisture are made manifest. During two such periods, occurring in June two out of the five years, where an adequate mulch was maintained on the surface of the ground, either through the agency of cultivation or a heavy supplemental covering, the percentage of soil moisture was more than twice that in grass land. These soil moisturs conditions are closely correlated with the girth increase made by the trees. The great importance of water in tree growth is further emphasized by a study of the precipitation data which show that the variation in growth due to seasonal moisture conditions, appears to have been quite as large as

The soil temperature studies were carried out under field conditions (at a uniform depth of 9 in. on al lplots) by means of soil thermographs. As the soil temperature is largely a reflection of the air temperature, the extent to which soil temperature can be controlled by cultural practices is quite limited. The data do not support the opinion that rain is of importance in warming the soil. There is no indication that the single factor of soil moisture had an influential bearing upon the temperature existing under the dicerent systems of soil management. The temperature range varies inversely with the amount of mulch covering the soil. The role of soil temperature within the limits of ordinary cultural practice appears to be a neutral factor in tree growth in Indiana.

From a study of the chemical changes induced in the Laurel soil by cultural practices during the period 1910 to 1915, it appears that clean cultivation tends to deplete the soil of its organic matter, despite the fact that a cover crop is being urned under each year. The straw mulch plot has increased slightly in organic matter, while the sod plots have, as a whole come nearer to holding their own in volatile matter, humus and nitrogen, than the clean culture cover crop plots. There is no apparent correlation between the previously mentioned chemical factors and tree growth.

A study of the average bacterial population shows that there are in most cases, more bacteria present in the sod ground at Laurel than in the clean culture cover crops plots; that the variations in mulch on the sod plots have some influence on bacterial numbers; that tree growth and soil moisture cannot be correlated with bacterial numbers.

Tests show that ammonification varies with the season. Differences between plots are not consistent with seasonal climatic variations, and it is impossible to say that cultural practice has affected the ammonifying power of this soil. Tests show that nitrification varies with the season, but that a growing crop of grass or rye lowers the nitrate content of the soil; that the most nitrates are found under the clean culture cover crop system, the straw mulch ranking second in amount of nitrates; that the girth gains of the trees are roughly proportional to the nitrate content of hte soil; that there is no relation between the nirifying power of the soil and either cultural practice or tree growth; however, the ratio between the nitrates present in the field and the nitrifying power of the soil does bear a relation to tree growth.—By Woodbury, C. G.; Noyes, H. A., and Oskamp, Joseph, in Purdue University Agricultural Experiment Station Bulletin No. 205.

HOW WINTER RHUBARB IS PRODUCED

The production of rhubarb in winter has become of considerable value among gardeners. It is easy to do if certain methods are followed. If one is making a permanent business of rhubarb forcing, it is necessary, each year, to set out a new bed as plants once forced are of no further value. In the spring large roots should be dug, split in one bud sections and replaced in rich moist ground. During the growing season they are kept cultivated and free from weeds. In the fall they are covered with manure. Next spring a second bed is planted as before. That fall a large part of the first bed is taken up leaving sufficient to replant another bed the next spring. The roots are taken up the last thing in the fall before the hard, freezing weather comes and are placed in piles in a shed where they can easily be got at during the winter, but will remain frozen. About Dec. 1st take in a sufficient number of roots, place these bud side up on the floor of a warm cellar—about 68 to 70 degrees—and cover with an inch of sand. Be sure to fill in all interspaces. Keep this sand moist. About a week later the buds will begin to swell, and in from four to six weeks, depending upon the heat of the room, the cooler the slower growth starts—you should have rhubarb ready for market. After these roots are exhausted throw them away and put in more. If a constant supply is required make a new bed every two or three weeks during the winter. Be sure to keep all lights dimmed. Put burlap or brown paper over the windows to get the bright pink color so much desired.—A. H. MacLennan, B.S. A., Ontario Vegetable Specialist.

Smart Children's Shoes
That Stand Hard Wear

Sturdy little ones are neatly shod in comfortable Amherst Shoes. Their growing feet are not crowded—especially in the flexible foot-form lasts with the smooth tread—and these shoes will wear longer than most.

Made in sizes 11-7; 8-10½; 5-7½

Amherst Boot & Shoe Company Limited, Amherst, N.S.

THE 1919 NOVA SCOTIA FRUIT GROWERS' CONVENTION

The annual meeting of the Nova Scotia Fruit Growers' Association will be held this year at Bridgetown, on January 21, 22 and 23. The Nova Scotia Fruit Growers are a live aggregation that for many years have been leaders in the most progressive agricultural movements inaugurated in that province. They stand firmly behind any policy that has for its object the advancement of their province in general and their chosen profession of fruit growing in particular. Important questions are discussed with a statesman's like grasp and many and profitable have been the inspirations received by those who have had the pleasure of attending their conventions. Then on to Bridgetown in time for the opening session on the 21st, to help further and stimulate the fruit industry in Nova Scotia.

CONTROL OF POTATO ROT

Most of the potato rot this year was due not to blight, but to a ground organism, which, of course, attacked the tuber from the outside. The wet condition of the soil provided favorable circumstances for the rapid propagation of thi sfungus. The Nova Scotia Department of Agriculture has been conducting experiments looking to the control of this disease. Results are not yet complete, especially with regard to potatoes exposed to long periods on board ship. Enough test have been made, however, to give assurance that in ordinary storing conditions this form of rot may be controlled or at least decidedly checked. The method of treatment is to dip the potatoes in a wire basket preferably, into a tub of weak copper sulphate (bluestone) solution, say 4 oz. to 40 gals. of water, and then allow them to dry. This, of course will not save the potatoes already partly rotted, but with a thorough picking over, it will greatly assist in preventing the spread of contagion in barrels or in bins. The same treatment will prevent the spread of the form of rot which accompanies blight, if the tubers are picked and treated before storing. Further information on this important matter will shortly be available.

ANNUAL CONVENTION

DAIRYMEN'S ASSOCIATION OF NOVA SCOTIA

TO BE HELD IN

AGRICULTURAL COLLEGE, TRURO, N. S.

JANUARY 9th and 10th, 1919

All cheese factories and creameries in the Province of Nova Scotia are requested to send their fullquota of delegates.

Creamery Butter Exhibition in connection and judging of Butter in Summer Competition.

For any information, write to

W. A. MacKAY,
Sec'y., Truro, N. S.

BRITISH APPLE EMBARGO REMOVED

By C. W. Baxter, Fruit Commissioner

The British apple embargo was put into effect on February 24th, 1916, owing to the urgent demand for ocean space to accommodate food stuffs and munitions for the effective prosecution of the war. Subsequently, at the urgent request of the British Fruit Trade and the Canadian growers, this embargo was modified so that during the season of 1916-17 apples could be shipped to Great Britain until July 31, 1917, provided that the quantity imported into Great Britain must not exceed 50% of the total import during the previous season. Thus the embargo automatically came into effect again on August 1, 1917.

During the fall of 1917 very energetic efforts were made to have the embargo again modified. The trade in Great Britain was particularly active, and apple exporters in Canada took every possible step, and made every possible plea, to have a satisfactory adjustment made. These efforts were all without avail. The food situation in the Old Country was in a more or less critical condition, and apples were not considered as essential as other food stuffs. It was, therefore, necessary for the Nova Scotia crop to move westward in Canada and for many Ontario apples, which might otherwise have been exported, to be disposed of in our home markets. The apple crop that year was light, and was, therefore, distributed and disposed of at excelelnt prices for first quality fruit.

On November 15, 1918, a general license was issued to the British trade permitting the import of apples in any quantity. It was pointed out that exporters must find their own space. As soon as we received this information, we at once cabled our representative in Great Britain asking him to keep us advised, by cablegram, immediately upon the completion of arrangements. As it was understood that sales in the United Kingdom would be subject to controlled prices and as the ocean transportation rate was very indefinite, it was of the greatest importance that these two figures, namely, the transportation rate and the British fixed or controlled price, be obtained as quickly as possible.

Our next information was received on November 18th, when we learned that all arrangements for shipping space were to be made through the office of the British Ministry of Foods (Canada), at Montreal, and that applicants for space would be furnished with the necessary forms when space was available.

On November 25th, we learned that the ocean rate would be $5.00 per barrel and $2.00 per box, with no discrimination between Ontario and Nova Scotia barrels. We also received a cable from our British representative to the effect that while no apple order had been issued, it was probable that the retail maximum price would be fixed at 9 pence per pound and the primary distributors' maximum at 6¼ pence per pound. It was also pointed out that importations would probably be restricted to licensed importers.

Thus the situation stands at the time of writing. The removal of the embargo will particularly affect Nova Scotia, where there were approximately 200,000 barrels of apples still in storage when the embargo was removed. These can be readily exported from Halifax to Great Britain, and even if the quantity of available space is small on individual steamships, yet in the aggregate it is probable that no difficulty will be met in obtaining all the space required. The situation is hopeful, and one, which after nearly three years of restricted markets, will afford the Canadian grower and the Bruitish fruit merchant very necessary encouragement.

Soldiers Home Coming Campaign

War Work and After-War Work of the SALVATION ARMY

"FIRST TO SERVE—LAST TO APPEAL"

The Salvation Army has for 53 years been organized on a military basis—inured to hardship, sacrifice and service. It is always in action, day and night.
It has maintained Military Huts, Hostels and Rest Rooms, providing food and rest for tens of thousands of soldiers each day. 1,200 uniformed workers and 45 ambulances have been in service at the front—in addition to taking care of the needs of soldiers' families here at home, assisting the widows and orphans, and relieving distress arising from the absence of the soldier head of the family.
Notwithstanding all the Government is planning to do, notwithstanding the pensions and the relief work of other organizations, hundreds of cases of urgent human need are constantly demanding the practical help the Salvation Army is trained and equipped to render.

The Salvation Army Million Dollar Fund

January 19th to 25th

While it could do so, the Salvation Army has carried on without any general appeal. Now the crisis is arising with the return of the 300,000 soldiers. The budget for essential work during the coming year has been prepared. A million dollars must be raised to continue the after-the-war activities, which include:

Hostels for Soldiers

Salvation Army Hostels are vitally necessary for the protection and comfort of the soldier at the many stopping places between France and his home here in Canada. These Hostels—or military hotels—provide good food, clean beds, wholesome entertainment at a price the soldier can afford to pay. If the boys did not have a Hostel to go to, WHERE would they go?

Care of the Wives, Widows, Dependents and Orphans of Soldiers

Scores and hundreds of cases could be cited where soldiers overseas have been comforted by the assurance that the Salvation Army has stepped in to relieve their families from dire need. As an instance, a mother with six children is located—no fuel, weather freezing, food and funds exhausted by sickness and other troubles. They are taken to Salvation Army Emergency Receiving Home. Winter and 300,000 soldiers returning increase the demands on the Salvation Army, whose personal help alone is of avail. Consider, too, the vast and complex problems arising out of the care of soldiers' widows and orphans.

Keeping the Family Unit Intact

The women of the Salvation Army on their visiting rounds accomplish the apparently impossible. Is the discharged soldier out of a job? They find him one. Is the wife sick, the home-work piling up, the children neglected? They nurse the wife, mother the children, wash and scrub. Is there urgent need for food, fuel, clothes or medicine? They are supplied. It takes money, of course, but more important is the loving spirit of service in which the work is done.

When the Soldier Needs a Friend

The Salvation Army Lassie provides the boys with hot coffee, the pies, chocolate, magazines, writing materials, and the spiritual comfort which the boys in Khaki need. Until the last homeward-bound soldier is re-established in civilian life, will you not help the Salvation Army to combat the discomforts and evils that beset his path?

The service of the Salvation Army, founded on sacrifice, demonstrates the true spirit of the Master. It is directed to the extension of the Kingdom of Christ. For two generations the Salvation Army has stood out and out for God.
It approaches practical problems in a practical way and achieves RESULTS. It co-operates with all—overlaps none. It recognizes neither color, race nor creed. It is always in action, day and night. No organization does greater work at less cost. To carry on its great work it must have financial help, and on its behalf members of the Dominion Government, business men and returned soldiers endorse this appeal for funds.

"LET YOUR GRATITUDE FIND EXPRESSION IN SERVICE"

CHEAPER BUG POISON

Among poisons for the control of biting insects, such as the potato bug, Paris Green has been first both in point of time and in popularity. It is now an expensive article, and farmers are reminded that they are paying the greater part of the price for the green colour, which is of no importance so far as the killing of bugs is concerner. The green tint is due to the large crystals of arsenic when combined with a copper base. The estimated metallic bases are copper, lead, zinc and lime. Of these, copper has advanced greatly in price during the war, and is now nearly in the closs of precious metals. The cheapest in the lot is, of course, lime.

When arsenic is combined with lime one resulting compound is arsenate of lime. The appearance of this compound is that of a very fine white powder, and the price is about one third that of Paris Green. Its killing properties, per content of arsenic contained, exceed those of the latter, as it contains the same poison in a much lne rcondition so that it remains longer in suspension, thus requiring less stirring, and for the same reason adhering much better to the foliage.

Arsenate of lime is suitable for use alone or compounded with Bordeaux mixture on all vegetable crops, including potatoes. For fruit trees 5 pounds of water slaked lime should be added to one pound of arsenate.

A tremendous business has sprung up within the past two years in this cheaper poison, partly owing to its effectiveness in controlling the boll weevil, the most serious foe to the cotton crop in the South. It is easily available, and should be on sale at all points. Ask for arsenate of lime and save more than half your outlay for poisons.

MANUFACTURE OF CIDER

Sweet cider is unfermented apple juice, and hard cider is fermented apple juice. To get the juice the apples are either crushed or ground in a cider mill and the juice pressed from the pulp.

The fermentation of apple juice, or any other fruit juice, is brought about by the development in it of yeast. Yeast cells are microscopic plants invisible to the naked eye and are always present on the surface of fruit. When the fruit is crushed to get the juice many of these yeast cells get into the juice and if these are not destroyed they will induce fermentation.

Consequently, in the manufacture of sweet cider we must destroy the yeast cells that are present and prevent others from getting in. The surest way of doing this is to pasteurize the juice immediately after it is obtained from the fruit and store away in well-sealed containers. In the case of cider the pasteurization process means heating the juice to 170F. for ten minutes and then filling into containers that have been scalded and can be tightly corked. Care should be taken not to let the temperature get above 170F. during pasteurization or the character of the juice may be injured. The juice is then stored away at a low temperature to allow it to clear.

Hard cider is produced by allowing the fresh apple juice to ferment in the cask. The fermentation is naturally induced by the activities of the yeast cells that get into the juice from the surface of the apples. As, however, there are various kinds of yeast cells, and also many mold spores liable to be on the fruit which may injure the quality of the cider spoiling the flavor, it is a good plan to control the fermentation either by first pasteurizing the juice and then adding a good yeast or simply by adding a good yeast to the raw juice as soon as obtained from the apples.—Prof. D. H. Jones, G. O. A. College, Guelph.

DAIRYING.

RAISING DAIRY CALVES

Assuming that we have a normal, fully developed calf, weighing from 70 to 85 pounds at birth, which is about the right weight, all things considered, we leave the calf with its mother from two to three days, or till the milk of the dam is marketable. We like to take the calf away from its dam in the afternoon, and then the calf is ready for something to eat when the dam is milked next morning. All milk fed should be 90 degrees Fahrenheit. The calf is then fed three times daily, its mother's milk, about four pounds to a feed, which we weigh. We weigh all milk fed to very young calves, and believe it pays to do so. This we can do nicely as we milk our new milch cows three times daily at the start, even though they are not continued so very long. When the calf has become adjusted to conditions, and is thrifty, two or three weeks of age, we begin by substituting in the morning and evening meal, one pound of new warm skim milk, but as we separate only twice daily, the noon feed is still whole milk. When the morning and evening meal becomes about half and half whole milk and skim milk, the noon feed is curtailed, and warm water added to give bulk, until the noon feed is water alone. As the noon feed is reduced in milk, it is added to the morning and evening feeds. From this time on, the quantity given depends on the individual.

The calf is usually four or five weeks old by the time this gradual change from whole to skim milk has been taking place. This idea of the noon-watering is continued regularly, and the temperature regulated according to size of calf and season of the year. I believe that many a calf really suffers from not having water to drink. Their tastes vary in this respect, some seldom drinking only a few swallows, while others will surprise you in the quantities they will drink. I refer especially just at this point to calves who have no access to a drinking-trough, but are hand-fed in their own pens. The length of time that a calf is given skim milk depends wholly upon the available supply. We have fed it once a day to heifers nearly two years of age. I believe it is really worth more for poultry and pigs than for 2-year-old heifers, but they certainly do well on it, even then.

Teach It to Eat Grain

We teach the young calf to eat grain, a mixture of bran, ground oats, hominy, and a small quantity of oil meal, as early as possible. This is easily done after feeding milk, and it takes away the notion of sucking. The quantity varies according to age, but two pounds a day will help out wonderfully in their growth. Don't forget to put some salt in the grain ration, or grain-box, for they require it same as any other animal. It stimulates their appetite, and aids digestion.

It is our custom, and commend it to all breeders, to weigh their calves regularly (monthly). We are not satisfied unless a calf has made a daily average gain of two pounds. They will not do this often the first month, but it puts you wise to the actual growth of the calf, and informs you whether your course of feeding is adequate or not. We had one bull calf, about six months of age, which made a gain of 105 pounds in one month. It is needless to say that this calf was especially thrifty, and made good use of a generous amount of skim milk, of which we had a plenty at that patricular time.

Don't keep over two calves in any one pen, one is better, unless they have an exercising paddock for them to run in and out of at will.

Exercise is necessary to growth, but be careful not to allow a calf to get too tired, when first turned loose after being shut up for a long period, as they are during the winter months. This might give them a set-back temporarily unnecessarily. Set-backs are uncertainties.

The constitution and vitality of the parents are matters which precede the birth of the calf, but which the breeder should not lose sight of. A cow weakened from too heavy and too continuous milking, not given an opportunity to recuperate from the strain, or any other cause, will be apt to drop an impoverished, weakling, which will tax the ability of the most successful calf raiser to get started nicely and prove a worthy successor to either parent.—W. L. P.

THE COW'S KEEPER

The superintendent of a boys' school, where a dairy herd is maintained and is cared for by the students, recently asked us for an "authoritative word which we can use to impress upon our boys the necessity of carefulness, quietness, and gentleness in handling the cows." Thinking that possibly our reply may be of interest to others, re reprint it below, although it is a somewhat more intimate an dpersonal statement than we usually publish. We said:

"Possibly the best word we can give the boys is to quote the following "Notice to help" which Ex-Governor Hoard, the Senior Editor of Hoard's Dairyman, keeps posted before the men ding the work on his farm:

"The rule to be observed in this stable ta all times toward the cattle, young or old, is that of patience and kindness. A man's usefulness in a herd ceases at once when he loses his temper and bestows rough usage. Men must be patient. Cattle are not reasoning beings. Remember that this is the Home of Mothers. Treat each cow as a mother should be treated. The giving of milk is a function of motherhood; rough treatment lessens the flow. That injures me as well as the cow. Always keep these ideas in mind when dealing with my cattle."

Many years ago, in his lecture on "The Dairy Temperament of Cows", Mr. Hoard said:

"Now, my friends, you and I very little understand the wonderful connection between the nervous machinery and the mammary function; if we did understand it better, we would use this gentle mother a great deal better. No finer truth was ever uttered than that expressed by Mr. W. C. White of Wisconsin, a man who illustrated in his person the sweetest elements of human nature,—the most successful dairyman that ever appeared in our state. When asked how he treated his cows, he said: 'I always speak to a cow as I would to a lady.' A great many men reverse it, and speak to ladies as they would to a cow. But, my friends, the man who is lacking in respect for the motherhood of either does not deserve either."

Let the bbys understand that a cow is a mother, that she needs the care and comforts of motherhood if she is to do her best. No true dairyman believes the dairy cow can rough it and perform her function to the highest degree. She must receive the treatment her function demands or low production of milk will follow. The cow is honest and does the very best she can with her talents and the care she receives from her owner.

There is a tendency upon the part of all of us to overlook little things but it is the little things that make the difference between profit or loss—success of failure. See to it that your cows are well fed, it pays. See to it that your cows are comfortable and well kept, it pays. See to it that your cows are known to you as individuals and that they have a place in your affection, it pays. See to it that all the little things around the barn are done well, it pays. See to it that kindness and intelligence govern your every action in caring for your cows, it pays. The man who does not think it worth the very best there is in him is not worthy of farming.

It is not uncommon to hear the dairy cow spoken of as a machine. Barring the injustice this does to the cow as a sentient, intelligent, and responsive being, there is considerable justification for applying this antonym to her for in many respects she responds to the definition and purposes of a machine—so wonderfully is she designed, so carefully is she constructed, so delicately is she adjusted.

When we consider the dairy cow from the machine point of view we find many similar conditions. She is marvelous in construction; has a nerve force, closely allied to electricity, which separates, combines, and transforms crude raw material into a refined and useful product; she has been developed by intelligent breeding and feeding from practical worthlessness to great and constantly increasing efficiency; she is thoroughly responsive to human sympathy and humane treatment from day to day and year to year; her productive capacity is largely governed by the care she receives and the feed given her. When we consider and compare these resemblances we begin to realize that the man behind the cow is a most important factor in dairy husbandry in developing and maintaining the efficiency of the dairy cow.—Hoard's Dairyman.

FACTORS IN PROFITABLE PRODUCTION OF SANITARY MILK

Kentucky Bulletin 206 by W. D. Nicholls describes experiments carried on with a view to determining the number of bacteria to which milk is subjected during the various daily operations in the dairy barn and milk room and to determine the best means of preventing bacterial contamination. The results were obtained by exposing glass petri dishes containing a sterile nutriment medium in the dairy barn of the station and the adjoining milk room.

The results indicate that in a well-cleaned dairy barn very few bacteria are present in the air, but when dust is present the number is very large. "When the cows are in the barn the number of bacteria in the air is materially increased. The presence of bedding in the stable greatly increases the bacteria of the stable air. Dusty mill feeds and hay are fruitful sources of bacterial contamination. The act of brushing the cows adds myriads of bacteria to the surrounding atmosphere. Washing the cows' udders, even when apparently clean, greatly reduces the number of bacteria falling from the udder. Infection from washed udders is less than one-seventh of that from unwashed udders. The air in a pasture upon which is growing a heavy sod of grass is nearly sterile. In a dairy room having smooth walls and a concrete floor which are regularly and carefully washed the air should be practically free from bacteria."

It is suggested that "to keep down the bacterial contamination of the air in the stable where the cows are milked the room must be kept well cleaned and every effort must be made to keep down all the dust. Dusty bedding must be avoided, and if bedding is used dust should be laid by sprinkling. Since cow hairs are laden with bacteria, all loose hairs should be removed from the cows by curryinf, in order to prevent them from falling into the milk. However, sufficient time should elapse after currying, in order to prevent them teria to settle to the floor before milking egins. The cows' udders should be carefully washed with tepid water and a clean cloth before milking begins. Wiping the udder with a clean, damp cloth greatly reduces bacterial contamination of the milk. In feeding mill feeds and hay care should be taken to raise as little dust as possible."

OLEOMARGARINE IN CANADA

The following from the editorials of the "Farm and Dairy" pretty clearly shows how the Canadian people are taking to oleomargarine. In the United States the packing house by-product seeks to dress in the clothes of that which it imitates in order that it will be purchased by the people who do not know what they are buying. In Canada, however, the protection of the dairy industry seems to be sufficient and the information of even the "poor folks" enough that oleo is eaten only by the people "who have to take what is given them."

"Oleomargarine is not meeting with the public favor its advocates expected. Mr. J. A. Ruddick, Dominion Dairy Commissioner, reports that since the removal of the embargo on oleomargarine, a little over 4,000,000 pounds of that product has been imported into Canada and 6,000,000 pounds have been manufactured here. The actual consumption of oleomargarine will be even less than the figures given, because of the large quantities now held by importers who cannot dispose of them. "These quantities," says Mr. Ruddick, "are not large compared with 140,000,000 pounds of butter which we consumed during the same period."

When oleomargarine was first introduced, the curiosity of the public had been kept on edge by the great

amount of free publicity given to butter imitations by the city press. Everyone was anxious to try oleomargarine and the opening demand was keen. Since then interest has waned. People have found that there is no really acceptable substitute for butter, and as long as consumers can secure the real article they will have it. Incidentally we might remark that the "poor folks", in whose interests oleo was supposed to be introduced, are buying it practically not at all. Here, as in the United States, the big market for oleomargarine will be the hotels, restaurants, and boarding houses, where it is served to people who have to take what is given them. Our experience with oleomargarine up to date has furnished no good reason why its importation into Canada or its continued manufacture in the country should be permitted after the war.

Dairy

AGE AND THE MILK FLOW

In adding animals to the herd it is always necessary to know the age of the animal. The purchaser may want this information for more than one reason, depending somewhat upon the purpose for which the animal is desired. She may, for instance, be wanted for breeding purposes, and the length of time she may be expected to breed is important and has a very important influence upon her value as an addition to the herd. Again, she may be wanted simply for her performance as a milk producer. Here there are other factors than her probable period of usefulness to consider, for if she be a heifer, the purchaser will be inclined to estimate her possible or probable production as a mature animal. If the animal is already mature the purchaser will want to know how long he may expect her to yield milk in quantity and richness. It is well known, of course, that there is a somewhat rapid increase in milk production as heifers reach maturity. The fourth milking period corresponds more or less closely to the sixth year in the life of an animal, and it is in this year, according to experiments made at the University of Missouri, that cows may be expected to produce tehir largest flow of milk. It is possible, nevertheless, for animals to make their best records at the age of ten or eleven years, but this we believe to be the exception rather than the rule, for there are always certain animals as well as people whose actions prove exceptions to every rule that is laid down. For this reason, decline in milk production as age increases is difficult to represent. At the Unviersity of Missouri the experiments referred to above gave results which may be expressed as in the following table, showing that from the fourth to the seventh period there is a slow decline in production:

Number of Milk Period	Number Cows	Per Cent. Av. lbs. of Milk Produced Fat
1	10	4754
2	10	5060
3	10	5648
4	10	6575
5	10	6341
6	10	6339
7	10	6282

This table, however, shows the average production per year from only ten Jersey cows. Certain individuals might depart very radically from the average, so that these figures show little more perhaps than that a decline may be expected after the fourth milking period.

Some years ago the American Jersey Cattle Club published the records of Jersey cows in a book entitled "Jersey Sires with their Tested Daughters." About ten per cent. of these records are authenticated, the remaining ninety per cent. being private records of the earlier Jersey breeders, but quite probably true accounts of actual production. At least they have been considered so by Pearl, of the Maine Experiment Station, who has closely examined these records in an endeavor to study the influence of age upon the milk flow. Eckles sums up the increase in milk flow until maturity is reached as follows: "A dairy cow on the average as a two-year-old may be expected to produce about 70 per cent.; as a three-year-old around 80 per cent.; and as a four-year-old aobut 90 per cent. of the milk and butterfat she will produce under the same treatment when mature.

With regard to the richness of the milk as age advances, Eckles does not find such marked differences. Differences do exist, however, and these are brought out by the following table:

Numebr Milk Period	Number Cows	Fat Yield in Per Cent.
1	37	71
2	37	84
3	37	93
4	26	100
5	20	98
7	10	95

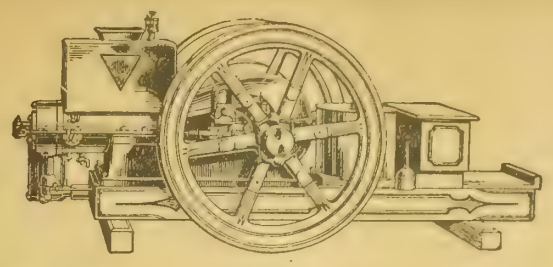
The author, therefore, concludes: "While the daily variations in the percentage of fat in the milk of all cows is constant and striking, the average for the entire milking period varies but little from year to year. While it s not entirely safe to judge the future milk production of a cow from her two-year-old record, it is reasonably safe to judge the richness of her milk. The richness of milk remains practically constant from year to year, except that after the third milking period there is a slow, gradual decline with advancing years."

COST OF PRODUCING MILK

It is of the greatest importance to be able to determine the cost of production by some method which has become more or less standardized. During the last three or four years there has been a great deal of dissatisfaction prevalent among both producers and consumers over the increased price of milk. The consumers have been faced wit ha steadily increasing cost of living and the producers have been faced with a steadily increasing cost of production, but they were not able to convince the consumer or the city milk distributor that they were entitled to an increase in price without a great deal of dissatisfaction. It is, therefore, of interest to dairymen generally to know that the Dairymen's League in the United States passed a resolution at a September meeting, whereby the "Warren" formula for determining the cost of production of milk was finally adopted by the League. This method of determining cost is approved by the United States Food Administration. The principle of this formula is briefly explained in the Holstein-Friesian World as follows: "On the average it takes the following factors to produce a hundred pounds of milk testing 3.8 per cent.; 33.79 pounds of grain, 43.3 pounds of hay, 10.8 pounds of other dry forage, 102.5 pounds of silage and other succulent feed, 3.02 mours of labor and 25 per cent, of the cost of the above factors for miscellaneous factors such as pasture, depreciation, etc.

If the market values of each of the above factors are obtained, the sum will be the average cost of production of 3.8 per cent, milk. But, of course, it costs more to rpoduce milk in some months than it does in others. To care for this variation and to find the cost of production for any particular month, the average monthly price as obtained above must be multiplied by a percentage factor which has been worked out as correct to give the proper variation for each month. This factor will be more than 100 per cent. in winter and less in summer. For instance, suppose the average monthly cost for producing milk is found to be $2.80 per hundred (this figure, of course, is not correct, but it is only given as an example.) To find the price for November when milk is high, the average yearly price $2.80 would be multiplied by 119 per cent., which is the percentage variation factor for November; and to find the price for June, $2.80 (the average price) would be multiplied by 70.6 per cent., which is the percentage variation factor for June.

The formula has been worked out by Professor G. F. Warren, of the College of Agriculture at Ithaca, from the great mass of evidence on the cost of milk production which has been collected in the last few years. The formula is a scientific method of determining the cost of producing milk, and is fair to every one concerned because prices emade from it represent the real cost of production. It will be especially acceptable to farmers because it ensures them fair prices for their milk by giving them costs on all the factors that go into the production of milk.



Alpha Gas Engines
SAVE

Work No more operating your pump, turning your cream separator, running your churn or washing machine by hand.

Time and Money No more hauling your feed to the mill to be cut, or ground, or hiring someone to come to your place and grind it for you. A small cutter or grinder and your Alpha would always be ready.

Fuel The Alpha uses gasoline or kerosene, and much less of either than any other make of engine.

An Alpha Gas Engine will soon pay for itself on your farm

Write today for our catalogue which describes in detail all the twelve sizes of Alpha Gas Engines and shows why the farmer who buys the Alpha gets the most for his money.

HOW TO IMPROVE QUALITY OF MILK

During the present time when there is such an unlimited drain on the country's products, the dairyman who produces a product of inferior quality is not rendering his best service to his country.

The man who produces unclean and filthy milk is especially unpatriotic. This milk, if sold for ready consumption, causes disease; if used for butter-making it produces an inferior grade of butter; and if used for cheese faking, in all probability will produce cheese that will not keep.

While it is not possible for all farmers to produce a grade of milk similar to certified milk, it is possible, by a reasonable amount of care, for all farmers to produce a high grade of milk.

The following are a few precautions that should be noted by every conscientious dairyman:—

1. Cleanse milk pails and milking apparatus thoroughly after each milking.
2. Brush off cow before milking.
3. Milk with clean hands.
4. Do not allow any dust in barn during milking.
5. Remove milk from barn as soon as possible after milking.
6. Cool milk to 50 degrees or thereabout as soon as possible after milking.
7. Keep milk in a clean cool place.
8. Do not allow manure to collect around the barn door and in the corral.
9. Keep barn reasonably clean.
10. Do not sell milk from cows that have not been tested for tuberculosis.—W. E. Spangler.

CAUSE OF CLOTS IN MILK

Clots in milk are quite common. The condition is generally known as garget. Sometimes the milk is affected only slightly, and sometimes it is seriously affected. The cause is not definitely known, but it is due to an abnormal condition of the cow's udder. Sometimes the trouble will occur two or three days and then disappear. Occasionally it will occur at intervals through the whole milking period of the cow.

C. H. Eckles of the University of Missouri College of Agriculture suggests that the cow be given a physic of 1½ pounds of Epsom salts in the form of a drencr. A tablespoonful of saltpeter given once a day for three or four days is sometimes beneficial. If the animal has been receiving much grain, tre ration srould be reduced for a day or two. The amount of grain may then be restored after the condition disappears. If the trouble persists month after month and the cow is not especially valuable, it would be advisable to dispose of her, because it is not always possible to eliminate the trouble.

LIVE STOCK.

NEW BRUNSWICK'S LIVE STOCK SUPERINTENDENT

In this issue of the Maritime Farmer will be found an article by T. G. Hetherinton, New Brunswick Live Stock Superintendent, dealing with "Present and Future Livestock Activities in New Brunswick."

Mr. Hetherington is a native of Queens County, where he spent his boyhood days, as do many of our young men in rural communities—farming in summer and lumbering in winter. Then came the lure of the west where he spent a number of years until meeting with a serious accident which temporarily incapacitated him for the endurance of excessive muscular strain.

He returned home and while recuperating turned his attention to study with a view to taking a college course in either forestry or agriculture, the two industries with which he had been so closely associated since boyhood. Agriculture presented the most attractive features and consequently he entered McDonald College, St. Anne de Bellevue, from which institution he graduated, after specializing on live stock, with the degree of B. S. A., in the spring of 1917. On graduating he accepted a position on the staff of "Farm and Dairy", Peterboro, Ontario.

Just about this time Hon. J. F. Tweeddale had been given charge of agricultural affairs in the province and was looking around for a man to take charge of his department's live stock policy. His choice fell upon Mr. Hetherington as a man whose college training coupled with his intimate knowledge of the prevailing conditions in the province, eminently qualified him for the position of Live Stock Superintendent. Mr. Hetherington accepted the position in the summer of 1917. The energy and enthusiasm he has put in his work is responsible for the steady improvement that has taken place in the upbuilding of the live stock industry of the province during the past year.

There are a great many progressive live stock men in the province of New Brunswick who co-operate with Mr. Hetherington in his work. The problem of getting the disinterested into the ranks of the interested, however, confronts the agricultural leaders in New Brunswick just the same as in the other provinces. There is a mighty lot of work to be done during the next few years if New Brunswick is to attain and maintain its rank in the live stock industry. Let all pull together with Mr. Hetherington to attain this goal.

Year by year numbers of our New Brunswick men who were in the farmer-lumberman class are no longer dividing their energies, but are of necessity putting all their efforts into their farming operations. Live stock husbandry, the key note of a sound and sane farming policy must have the attention that its importance merits. It is safe in Mr. Hetherington's hands.

THE CONTROL OF BOVINE TUBERCULOSIS

By M. Cumming, B.S.A., Principal, Agricultural College, Truro

The herd of cattle at the College of Agriculture, Truro, Nova Scotia, was placed under the "Bang" system for the eradication of tuberculosis in the year 1911. Fortunately, we had a barn removed about half a mile from the main barns and we decided to place the reacting cattle in this barn. We fancy that our successful experience with the tuberculin test since we began the system is partly attributable to the fact that the reacting cattle were kept so far away from the non-reacting cattle.

The non-reacting cattle are kept in the main stock barns and are tested twice a year. During the past six years there have been a number of tests when there were no reactions whatever in this herd, but occasionally we do get some reactions which are difficult to understand, and up to date we have no adequate explanation. Whenever any reaction does occur, the reactor is at once removed to the reacting herd.

The cows of the reacting herd are, as already stated, kept in a separate barn and are pastured separately. Their calves are removed immediately and brought to the main stable. Up to the present time only an odd one of these has reacted to the tuberculin tests which are commenced when they are one year old and continued regularly at six-month intervals after that.

The milk from the reacting herd is all pasteurized and separated, the cream being used in the ordinary way and the milk being fed to calves and pigs. Our herdsman is of the opinion that this pasteurized milk is not quite as satisfactory as the normal milk, but, none the less, the difference is not great.

Our experience in buying cattle has not been very satisfactory. Since we began the system, we have always bought subject to the tuberculin test but, fortunately for ourselves, have also adopted the principle of placing the newly purchased animals by themselves for at least three months, after which they are re-tested. Unfortunately, quite a percentage of these animals after passing the test at time of purchase, reacted three months later, and still more unfortunately, some of those that passed this second test and were then placed with the main herd, reacted subsequently. For this reason we have been careful in regard to purchasing, and, in fact, have added no females to the main herd for a number of years, confining our purchases entirely to males.

We have had some seven years' experience with tuberculin testing followed in a systematic way, and yet there are some problems connected with the procedure which we do not fully understand. For example, there are occasional reactions in the main herd for which we have no explanation to give. But, however, that may be, we are highly satisfied with our experiences with tuberculin testing, and consider that it should be much more extensively adopted. However, there is no use shutting one's eyes to the fact that the person who adopts this must temporarily have to stand a substantial loss, but ultimately the fact that such person has a healthy non-reacting herd is bound to prove to his financial advantage.

The most successful breeders of pure-bred live stock are men who do not sell the young animals that definitely excel the parents. High prices do not tempt, nor equal merit in other herds or flocks concern such makers of breed history. It is with their own familiar animals that they produce the best results, for no matter how excellent the purchased animal may be, it seldom produces as good results in carrying forward the breeder's ideals of improvement.

There is no rule to lay down in the matter of shoeing. Every horse owner should use his own judgment. But when it is found necessary to protect the foot or to prevent the horse from slipping when the roads are icy, not a moment should be lost to have the horse properly shod.

The Basis of Profitable Dairying

The influence of feed on the production of milk is striking. No matter how good the individual dairy cow is, the quantity of milk she yields is, within wide limits, directly dependent upon the feed she receives.

If a cow is subjected to feed of poor quality, unpalatable and indigestible, no matter how much she may be fed, she is sure to go away down in her production and will not yield any profits. Such a cow becomes a "boarder"—that is why our experts have compounded a mixed feed, properly balanced according to the needs of the dairy cow, rich in milk-producing nutrients, with a high percentage of these nutrients in digestible form.

Monarch Dairy Feed

a rich feed, but not too concentrated to feed alone and when fed liberally to dairy cows it will get the highest production possible with the least cost. There is no wastage in Monarch Dairy Feed—every pound has milk-producing value in it and more of it goes to the actual production of milk than of other feeds because such a high percentage of it is digestible.

Monarch Dairy Feed is composed of Oil Cake Meal, Cotton-seed Meal along with Bran, Barley feed and Corn feed. The mixture of Oil Cake and Cotton-seed Meals counteracts the constipation that would be caused by Cotton-seed Meal if fed alone.

Give Monarch Dairy Feed a trial and if the dealer in your district does not handle it, send us his name and we will see that you get it. By ordering early you will assure delivery when needed.

THE ROLE OF WATER IN A DAIRY COW'S RATION

By Larsen, C., Hungerford, E. H. and Bailey, D. E., in South Dakota State College of Agriculture and Mechanic Arts

Some dairymen claim that if the amount of drinking water given to a cow is limited, the body temperature is raised and the composition of the milk modified, the percentage of fat especially being increased. In order to verify this assertion the authors undertook a series of experiments (1) on the effect of watering cows at different intervals with varying quantities of water on the following factors: amoun of food consumed, digestibility of food, quantity and composition of faeces and urine, quantity and composition of milk, composition and quality of butter fat, body temperature and physical condition of the cow. Data on the mineral metabolism of the cow were also obtained. The experiment, carried out on four animals, was divided into three periods, separated by a period in which the ration was normal. In the first period the animals were watered every 24 hours (an average of 61.65 lb. per head), in the second period every 60 hours (an average of 51.20 lb. per head), in the third period with half the normal ration of water (40.00 lb. per head).

A series of tables gives:—Composition of feed and water; weight of animals, amount of food consumed and daily milk yield, coefficients of digestibility of the rations, amount of water drunk and food digested daily, daily amount and composition of the faeces, relation of amount of water to dry matter consumed, average daily amounts and composition of the urine and the milk, analysis of butter fat, average temperature of the shed and cows, effect of room temperature on the total amount and percentage of fat in the milk; food constituents digested per 1,000 lb. of live weight daily, daily energy requirements per 1,000 lb. live weight, distribution of water in the cow's body, average daily rations and balance of food nutrients in the three periods of the experiment.

Results.—(1) **Food consumed.**—When the cows are watered once in 24 hours instead of two or three times there is a sight decrease in the total amount of food taken and in the quantity of milk produced, but this second decrease is not proportionate to the first. During the 30 days of the experiment the animals lost an average of 11 lb. per head. This loss was much greater during the second test (17 lb.) and the third (95 lb. per head on an average).

During the periods in which the cows received a full ration of water at long intervals, the expected decrease in milk production was not obtained. If the slight decrease in the amount of food consumed and the loss in weight be considered it must be concluded that cows can utilise the water stored in their systems for milk production and other functions. When the cows only received half the normal quantity of water (test 3) there was a marked decrease in the amount of hay consumed, milk produced and in body weight.

(2) **Digestion of rations.**—The coefficient of digestibility was increased in each of the tests in which the intervals between watering were lengthened and in those in which the cows only received half the normal ration of water. This increase in the coefficient of digestibility is particularly marked in the case of crude fibre. Cows watered once in 24 hours digested 55% of crude fibre as compared with 54% digested by the control animals watered three times a day; cows watered once in 60 hours digested 71.07% of fibre as against 55.7% by the control animals, and those receiving half a ration of water digested about 2% more than the control animals.

The increase in the digestibility of the nitrogen free extract and of the protein is not regular and is less marked.

As regards the actual amount of crude fibre digetsed, the cows in test 1 digested about 0.09 lb. per head daily, and those in test 2 only 1.26 lb. more than the control animals, those of test 3 digested 1.125 lb. less than the control animals.

Numerous investigations have led to the general acceptance of the theory that the digestibility of crude fibre depends largely on he active bacteria present in the intestinal tract and the action of the digestive juices. It is probable that an increased amount of water retards acterial action in digesting crude fibre, and that a decreased more concentrated and, therefore, more efficient and makes the chyme firmer and slower in moving through the digestive tract so that it is expcsed for a longer period to the action of the secretions in the tract.

These results show that to obtain the most efficient digestion of food it is wise not to water the animals too abundantly at feeding time or immediatel y before or after a heavy meal.

(3) **Effects of the quantity of water ingested on the composition of the excreta.**—The percentage of water in the faeces and the urine varies but little with the different quantities of water ingested; theer was almost no difference between the faeces of the control animals and thos in tests 1 and 2; in test 3 there was a decrease of about 2%. Frequent watering seems to have no appreciable effect on the composition of the faeces except that lengthening the intervals between drinking slightly reduces the crude fibre. When the cows only received half the normal ration of water there was an increase in the protein, nitrogen-free extract and crude fibre contained in the faeces.

When the cows received an unlimited supply of water three times a day they drank 3.5 lb. for every pound of dry matter consumed, when watered once in 60 hours they drank 2.38 lb. per pound of dry matter, and when receiving half the normal ration of water every 24 hours they drank 1.8 lb. per pound of dry matter.

(4) **Effect of the quantity of water ingested on the quantity and composition of the milk.**—In all the tests the composition of the milk and butter fat remained absolutely unchanged. It is for this reason that a cow receiving insufficient water goes dry without there being any modification in the composition of her milk. Frequent watering has little influence on the quantity of milk produced. When the normal water ration was reduced by half the milk yield was reduced a little at the beginning, this reduction increasing as the experiment continued till it was aout ¼. There is no doubt that the cows would have gone dry if this ration had been continued.

(5) **Effect of water on the body temperature of the cow.**—When the cows were watered every 24 hours the body temperature was lowered by the fraction of one degree Fahrenheit 15 minutes after watering. With intervals of 60 hours the temperature droppen 2°F. The minimum was obtained 1 to 1½ hours after watering (130 lb. of water per head). The temperature of cows receiving half the normal ration of water was 1°F. higher than when the received a normal amount; but there was no increase in the fat content of the milk.

During a special experiment the cows were exposed to room temperatures varying from 51 to 104°F. It was found that the fat content tends to increase with the body temperature, though the increase is but slight; about 4.4% for 69°F. and 5.04% for 104.8°F. Since, however, high temperature slightly reduces milk secretion, the total amount of fat increases in inverse ratio to the percentage, in the case quoted from 11.2 lb. to 10.2 lb. per head daily. In conclusion it may be said that keeping dairy cows in milk in hot sheds, blanketing them and withholding water in order to raise the fat content is very dangerous to their health.

(6) **Physical condition of the cows.**—The abnormal conditions brought about by withholding water were nervousness, gauntness and high body temperature. When the animals were watered every 60 hours and when they received half the normal ration of water a larger amount of energy was required to accomplish the body functions.

(7) **Chief functions of water in a dairy cow's ration.**—The results of their experiments led the authors to the following conclusions:—A good dairy cow probably requires more water than any other domestic animal. Water dissolves food (for this reason the more food an animal eats, the more drink it requires), distributes it to the different parts of the body and removes the waste products. The auhors showed that more than 12% of the total water drunk is eliminated through the skin in winter in the shed, and 27% in August; 56% of the water drunk is eliminated in the faeces and 15% in the urine. On an average, 15% of the water drunk passes into the milk (in good milkers this percentage is higher; in one of the experiment animals, among which there were no choice cows, this percentage was 24%). Water regulates the body temperature; the loss of water through the body was twice as great in August as in January.

(1) The effect of varying quantities of water in the ration or the composition of milk has been studied by many authors. Turner, Shaw, Morton and Wright compared experimentally:—(1) a full allowance with a limited allowance of water; (2) a heavy ration of turnips with a dry roughage ration; (3) wet beet pulp with dry beet pulp; (4) green clover with cured hay. They proved that, though individual cows produced milk with an abnormal fat content, the different rations did not as a rule influence either the quantity or the composition of the milk.

Gilchrist (Variations in the Composition of Milk and their Probably Causes, Durham County Council Education Committee Reports, Dairy Investigations, Offerton Hall, pp.7-27: 1909) found little or no difference in the quantity and quality of milk produced by cows either on pasture or a heavy mangel ration and that produced by cows on a ration of hay and grain.

Armsby found that cows drink more when fed a heavy protein ration than when fed a low protein ration, and that cows fed dry roughage drink about 40 lb. more water per day than those fed green hay. (Authors.)

The Ottawa Valley Journay of December 4th says:—

"A number of dairymen in the Chesterville district have commenced to send milk to Montreal again where they are getting higher prices for it than is being paid by the local condensery. The condensery during the month of November paid $2.70, but it has promised the farmers an increase for December, bringing the price up to $3.00 per 100 lbs."

Let Your Plow Be an Oliver

TAKE a simple type of two-wheeled sulky plow like the **Oliver** 26, equip it with a suitable bottom, put it into the hands of an Eastern Canadian plowman, and you'll see a good job of plowing.

The **Oliver** 26 sulky handles like a two-wheeled cart. It has a pole shift that changes instantly the landing of the beam, making it easy for the operator to straighten crooked furrows, to turn corners, or to plow side hills. The land wheel has a range of lift that insures good work on rough ground, around dead furrows, and in finishing out a land. No plow made works better on rough, uneven land or can be backed more easily. It has a horse lift that eases the work of the plowman without tiring the horses.

Other **Oliver** plows, from tractor and riding gangs down to walking plows, complete a line in which you can find any plow you may need at a price you can afford to pay. May we send you our folders telling all about **Oliver** plows for Eastern Canada? Write to the nearest branch house.

THE HORSE

ANOTHER "FLU" AN EQUINE DISEASE THAT IS CAUSING GREAT LOSS AMONG HORSES

Although the serious epidemic of influenza now affecting the human family has no relation to the disease of the same name which affects horses, specialists of the United States Department of Agriculture point out a resemblance of symptoms and course of the disease in each instance.

Equine influenza is a common disease in the large cities of the country, affecting horses which pass through infected stables of dealers. Only, however, under certain influences not understood and when large numbers of horses in commercial channels are exposed to contagion, does it assume an ezootic or epizootic form. Unlike certain other infectious diseases, one attack of influenza does not grant a lasting immunity. However, previous attack or attacks or other unassignable reasons apparently make old horses less susceptible than young ones.

An Old Disease of Horses

History indicates that this disease has been recognized in various outbreaks of several hundred years past Even before the Christian Era, a severe epizootic believed to be influenza, is rcorded as having occurrd in Sicily, and again in A.D. 1301, it spread over a considerable portion of Italy, causing great loss among the war horses of Rome. In 1648 the disease affected Germany and spread to other parts of Europe, and in 1711 it followed the tracks of the great armies all over Europe, causing immense losses among the horses. Other extensive outbreaks obtained at intervals from 1813 to 1883, one of which was that of 1870-73 ,in connection with the Franco-Prussian War. The first recorded appearance of equine influenza in North America was in 1766. Probably the most severe outbreak, however, was that of 1870-72, when it spread over the entire country from Canada, south to Ohio, and then eastward to the tlantic coast and westward to California, although the severity of the outbreak of 1900-01 should not be overlooked. In these epizootics, there was a heavy loss of horses, and being prior to introduction of the motor truck in city commerce, business in the great commercial centres of the country was seriously inconvenienced and in some cases practically suspended for lack of available horses.

Like the influenza epidemics in the human family, epizootics of equine influenza are difficult to control. The true primary cause of the disease has not been established, though it is generally believed to be due to a specific germ, too small to be detected under the highest power misroscope. It certainly has the characteristic of extreme diffusibility, leading to spread of disease over a large area of the country in a few days, the outbreak running its course despite all efforts to prevent it, and the infection gradually subsiding without assignable cause.

Symptoms of the Malady

The symptoms are those of fever, in some cases, preceded by a chill. There is great prostration and depression of muscular force; the visible mucous membranes, especially those of the eye, becomes a deep saffron, ocher, or violet red color, from which fact the term "pinkeye" has been given the disease. There is a great diminution or total loss of appetite and a rapid loss of flesh, which frequently reaches 30 to 75 pounds for each 24 hours. In complicated cases, the fever abates after 6 to 10 days, and there is a general restoration to health. The death rate is relatively low (during the epidemic of 1872 varying from 2 to 7 per cent.), the higher rate occurring among city horses. The complications are many and sometimes serious. Among such are those of the intestines and lungs. Pneumonia, one of the frequent complications, is always serious, as it affects the animal when reduced in strength and resisting power.

High Death Rate from bad Ventilation

The great propagating fields for "flu" among horses are the badly ventilated barns, that have no outlet for the vitiated air. All animal life on the farm requires oxygen in the system to enable them to resist disease. In close and badly ventilated barns this natural operation is restricted and the inmates are an easy prey to disease germs.

Inquiry as to the cause of so many deaths among horses in France, from influenza, led the French Government to enforce measures of better ventilation in barns. A census was taken—previous to the war—of the death rate of horses and as many as 126 per 1,000 annually died from pneumonia and 26 per 1,000 from glanders. After the measures for better ventilation were fully undertaken the death rate from pneumonia fell to 4 per 1,000 and 2 per 1,000 from glanders. The oxygen of the air is free to all and to exclude it from the barn is to court disease and death. Good ventilation does not mean cold drafts of air; it aims to have the same freshness and health-giving qualities in the barn as is to be found in the sunlight and freedom of the open field.

STRANGLES IN ARMY HORSES

Of all the infectious and contagious diseases affecting army horses, strangles or distemper no doubt ranks among those which cause the most trouble. It more often affects the young horses and is characterized by swellings under the throat which usually develop into abscesses of the lymphatic glands. The complications that develop are bad enough under ordinary conditions, and many of them are very serious, but those that affect army horses are much worse as a rule and more often fatal. This is due to the many conditions that the animals are subjected to during shipment. Sale barns and stock yards are badly contaminated with the infection. Vigorous campaigns were started among the contractors furnishing animals to the Government, but it was difficult to secure cooperation and assistance from stockyard companies and from the railroads.

It would seem that an animal sick with strangles is easily recognized under normal conditions, but at the time of purchase the secretions from the eyes and nose are cleaned off and the parts washed, and sometimes the insids of the nostrils are greased, The animal may be given a stimulant as large as he can stand. He is spurred on with the whip and is so excited that it is very hard to detect any symptoms of sickness about him. Purchasing officers should do away with as many unnatural conditions as possible and better animals would surely be purchased.

In the campaign for the better sanitary conditions for the inspection and purchase of animals for army use the following regulations were carried out: From barns where horses or mules are tied the manure is to be removed daily; the watering trough to be scrubbed daily and disinfected once each week; the feed-troughs to be cleaned each week and disinfected; the owner of the animal to inspect the animals daily and any showing signs of shipping fever to be removed to a hospital and remain until recovery or death. The stalls from which such animals have been removed should not be occupied again until they have been thoroughly cleaned and disinfected. This should be done within 12 hours. Receiving and shipping pens ,if uncovered, must be kept reasonably clean and disinfected semi-annually. If they are covered they must be cleaned and disinfected monthly.

Many of the animals purchased were in the incubative stage of this disease and enroute to their destination they became sick. Many of these were held four or five days and sometimes a week before they were shown. The majority of them, however, were shown about the second or third day after their arrival at the contractor's stable. Most contractors favored this, as it gave them an opportunity to fill the animals on hay and water, which greatly improved their appearance. By so doing they

Harness Must Be Dependable

IMPERIAL BRAND HARNESS

Harness that breaks under strain is a risk to life and limb and besides, it takes time and money to repair it. Get Harness that is "dependable," that holds together and keeps in fine condition under all reasonable circumstances. IMPERIAL BRAND HARNESS is guaranteed free from defect in material or workmanship. We have been in the harness business *for 52 years* and our goods have always given unqualified satisfaction. Your dealer sells it; if he doesn't, write direct to us—we can supply you promptly. We are manufacturers and can offer a big assortment at attractive prices. Express delivery charges paid at our end.

Special Offer

Our "Buggy Special," No. 104, is a big seller. It is thoroughly STRONG, HIGH GRADE AND FINE LOOKING. We particularize on this and have put extra value into it. Select leather of good weight. Single strap Breast Collar, raised layers; strong Traces; Breeching has side, back and hip straps; Saddle has patent leather skirts and jockeys, padded, leather linings and flexible tree and 1 in. swinging shaft bearers; Lines 1 in. with russet hand parts; Trimmings heavily nickeled. Solid Nickel, $2. extra. Genuine hard rubber $4, extra. Express prepaid to any station on receipt of price. Guaranteed satisfactory or goods may be returned. Order now.

greatly reduce their percentage of rejcted animals. Contractors are aware many times that the animals they are selling are exposed to the infection of strangles and that they will develop the disease during shipment to the remount depot. It seems as though the Government should very rigidly enforce the sanitary campaign mapped out a few months ago, for should any of the contractors refuse to comply with these regulations it would lessen the number of animals purchased very little, as the shippers would send their animals to some contractor who would keep his premises in such a condition as to be able to secure a contract for furnishing animals for service. The inspection of animals should be performed as soon after they arrive in the market as possible, as this would greatly lessen their chances for taking up the various infections commonly found around the market. Any contractor who purposely and knowingly conceals from the purchasing board the fact that the animal is affected with strangles or any other contagious and infectious disease should be forbidden to furnish animals to the United States. Just how greatly we may profit from the experience of the past winter in the control or prevention of strangles in army animals time alone will tell. Lieut. George H. Conn.

COLT WITH A "STRANGE DISPOSITION"

"I have a grade Belgian colt eighteen months old and well grown that has a strange disposition. He is gentle in every way, but when the least excited seems to go wild. I have noticed this trait through his getting into the wrong stall a time or two, and when he makes this mistake he seems terribly frightened, and is hard to handle. He has never been roughly used; in fact, he has never received a blow or a harsh word, to my knowledge. He does not lead up as he should when haltered, seems suspicious of the man ahead, and has no great respect for the rope; that is, he is hard to handle, and often hangs back or refuses to come at all. How should I bit him so that he will handle well when I come to drive him? At what age should I begin to use the bitting rig, if at all? I should like to make a good sensible horse out of this colt, if possible. His dam is a grade Belgian, easy to handle, although a trifle nervous. The sire is an imported horse, and has no bad habits, so far as I can learn."

It is just possible that the colt's extreme nervousness under excitement comes from heart or brain trouble. The untrainable horse is often so from a physical defect, only revealed by postmortem. Nothing will give a colt more confidence than a whip, intelligently used. Turn the colt loose in a well-fenced yard; a boxstall will not be big enough for one of his disposition. Stand near the centre and pop the whip a little—enuogh so that he will start away from you. Let him run around loose several times, and then begin touching him with the whip on the quarters enough to keep him moving. It needs tact; if he moves very fast and becomes very much frightened just let him run around. As he shows a disposition to stop, move him along, and every time he gets his head away from you, start him up again. After a while he will show a tendency to face you, and you can speak to him encouragingly, if you think best, though for my part I think it best to remain still and silent. Then pop the whip again, and he will probably run off again from you; continue as before, until he again faces you. Do not make the mistake of trying to accomplish everything the first day; if he is very much frightened, be satisfied if he merely faces you, and turn him out again the next day. After a while he will find that though the whip pops and even occasionally stings a little it does not touch him so long as he faces you, and sooner or later he will take a step or two toward you.

This may not seem a great accomplishment for several hours' patient work when by the severe use of the whip you could have brought the colt to put his head on your shoulder in ten or twenty minutes, but the measure of your accomplishment will be the amount of confidence and willingness to come to you that the colt develops. You may now take a step backwards; never move toward the horse, and if he follows you, quit for until he will come to you and follow you without the halter. Then halter him for the first time in these lessons, but never pull on it; use the whip until he follows the slack rope and teach him some other signal, such as snapping your fingers, though a silent sign of the hand is better. The principle involved is that the animal acts at your (and not his) volition; that, being slightly or greatly afraid of the whip, he comes to you for easement. You can never give confidence to a nervous horse by petting his fears; he considers you the harbor of refuge. The horse at first is afraid of the whip in your hand or he must be made slightly afraid of it, and gradually to perceive that you have a dual personality that can protect or make things uncomfortable for him, and that he cannot avoid you in the second person. A horse with proper whip handling undergoes an entire mental change and confidence replaces fear to an extent that I believe impossible by any other process.

Having taught the horse to come to you with the whip, do not fall into the common error that he will go away from you by the same indication, until you have further trained him, and that the whip like the reins has many functions.

A colt can be bitted at any age, if the lessons are short enough, and the means suitable to his age be adopted.

L. OGILVY.

HORSES ARE BAD WITH MUD FEVER

Mud fever or scratches is generally caused by exposure to mud or water, melting snow, neglect of grooming, and is many times accentuated by constitutional predisposition. In a case so bad as you describe, you will require to clip the hair close to the skin, bathe in warm water, then apply a warm poultice of scalded bran twice in 24 hours. After the scabs have been removed, wash with warm water, wipe dry, then bandage for a short time till legs are thoroughly dry, then apply boric acid, dusting into the sores, afterwards cover with some oily dressing like vaseline, glycerine or castor oil. The only way to prevent the appearance of scratches is to keep the horse's legs and feet clean at all times. Standing in manure when confined to the stall must not be allowed. When they come in from their hitching up, if legs and feet are muddy, dry them as well as possible, but do not wash them during the cold weather. When they are thoroughly dry groom them well. For the swollen legs bandage firmly when horses comes in from exercise. You should keep your horses in the stable in the meantime until you have got them cured. Give them exercise, but keep them free of mud and filth till better.

PRICE OF FARM HORSE

The average price of a farm horse in the United States, all ages included, declined from $145 in 1910 to $131 in 1916. In 1917 the average price went up to $132, but in 1918 the fall was resumed and the average price became $128. In 1910 the price of a farm horse averaged about 240 per cent. higher than the price of a cow; now a horse averages only 50 per cent. higher.

Horsemen Attention !

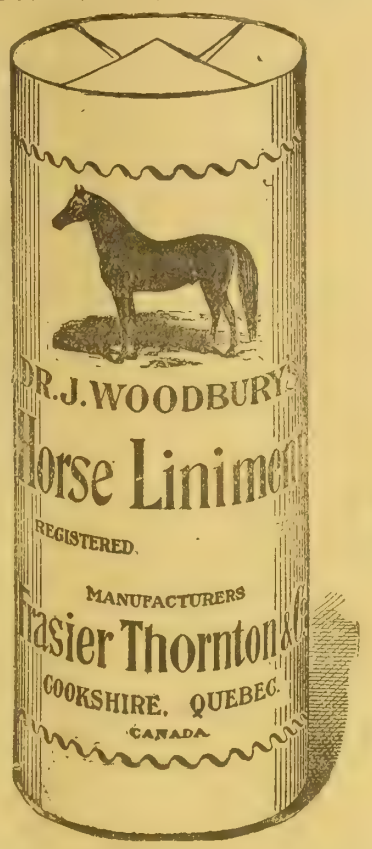
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsement of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

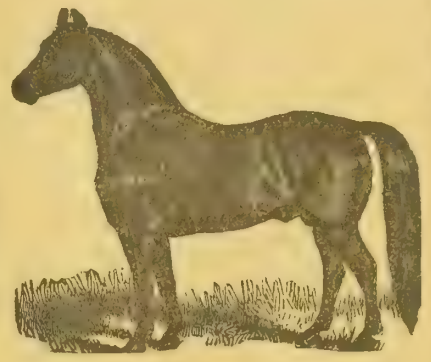
FOR SALE ALL DEALERS

PRICE 35 CENTS



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

DEMAND
DR. J. WOODBURY'S
HORSE LINIMENT



AFTER USING

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

POULTRY.

DELIGHTED

Maritime Farmer:

I am sending herewith a list of the prize winners of the Colchester County Poultry Show held in Truro, Dec. 17th, 18th and 19th and would be obliged to you if you could make any use of it in the Poultry pages of your paper.

After the experience of a good number of years with Poultry and Poultry Shows I have no hesitation in saying that the show which we held in Truro on the above dates was the best exhibition of Pure Bred Poultry for collection in any one County Show. A great many of your readers would be interested in knowing where to obtain both stock and eggs between now and next summer and I think it would be a very good advertisement to refer to your paper to obtain this information.

I trust you can see your way clear to insert this and oblige.

Yours truly,

J. P. LANDRY.

[Editors Note : — The Maritime Farmer is pleased to publish the list of prize winners at the Colchester County Poultry Show as submitted by friend Landry. We will also be pleased to hear from other heads of departments in any of the three provinces. The Maritime Farmer can assist the heads of departments to give publicity to any movement they may wish brought to the attention of the public.]

Cochin Black Bantams

Cock—1st Ernest McLaughlin.
Hen.—1st, Ernest McLaughlin.

Pigeons

Best collection pair of pigeons for breeding squabs.—1st, C. B. McMul-

It was a puzzle to me

I had a few dollars in the bank and was saving a little all the time, but without any definite plan. I looked at my neighbors, some of them men of means and wondered what they did with their money, their extra money, I mean. I supposed they invested it somehow, but how? That was the question and I was too bashful to ask.

One day, however, I read of a man who had been paying an instalment of $87.25 a month for a year and a half and had actually made $136 in interest on his payments during that time, while at the end of the eighteen months he was the possessor of 15 shares Canadian Pacific Railway Company Stock and in receipt of a dividend cheque for $37.50 every three months.

That was $150 a year, all made by a small Systematic Investment account with J. M. Robinson & Sons, Members of the Montreal Stock Exchange and doing business in Montreal, St. John and Fredericton.

To make a long story short that ended my puzzle—the answer had been found. I opened a systematic account with that house and my savings are earning the full dividend return of my investment. In a few months I shall have paid for and received a certificate for 20 shares of Dominion Iron Preferred and my income therefrom will be $35.00 every three months, $140 a year.

You, too, can follow this simple plan. I am sure that J. M. Robinson & Sons will send their very attractive little booklet explaining the plan, if you will drop them a line to 11 St. John St., Montreal, or to Market Square, St. John, N. B.

Thrift is the Maker of Character

Thrift is patriotic at this time. It is more—it is evidence of practical common sense, sound judgment and prudence, because it shows you are willing to make present sacrifice for future competence.

This Bank will gladly open a Savings Account for you, and deposits may be made by mail or in person.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

The day of this year will come and go,
As they ever have gone before,
And the weeks and months will surely pass,
And be numbered with those of yore,
The work of our hands will sink and be lost,
In the on-rush of wave and tide,
But our thoughts, and words, and deeds will live,
And forevermore must abide.
—Selected.

"Whom the gods would destroy, they first make tricky....Women are never tricky. Women are diplomatic."
from "The Book of Flossie May Darty"

FLOSSIE MAE, SUCCESSFUL WIFE

By Ellis Parker Butler

A man is mayor of Riverbank two years; and then, if he likes the job and can swing the votes, he may be mayor another two years, and so on endlessly. Mayor Darty liked his first two-year taste. It warmed his heart to be called "Your Honor." It quickened the beating of his heart to think that a descendant of Brian Boru, meaning himself, was ruler of the town. There were other reasons. The salary helped somewhat, but being the Honorable Padraic Darty helped his real-estate business magically. You can be plain Brick Darty and starve, but business will com eto the Honorable Pardaic Aloysius Darty, Mayor of Riverbank. Even the mayor of a small town begins to have henchmen and heelers who bring him business.

But most of all, Darty liked being mayor because it had put Flossie Mae, his handsome wife, near the top of Riverbank society, where she shone but third to the brilliant lights of Mrs. Doane and Mrs. Benderman, who still fought for the leadership.

"Dear soul of my heart," said Brick to Flossie Mae one day as his term neared its end, "do you want to be lady mayoress another term?"

"It is not 'Do I want to be?' Brick", Flossie Mae answered. "It is 'I mean to be.' That is, if you are willing to bear the cares of state that much longer. Are you?"

"I love the glory of it as a cat loves fish," said Brick with a grin. "So that is settled, dear light of the world. Lawyer Bean was here but this morning, sayin the Eight Big Men of Riverbank were well satisfied with me—as I hope the people are—and that I may have the nomination again if I wish it."

"Ah!" said Flossie Mae cryptically.

"I told him I had but to ask the wife of my soul what she desired, before I gave him my answer."

"Ah!" said Flossie Mae again.

"So now he shall have it," said Brick. "I will tell him this afternoon."

Flossie Mae said nothing for a minute.

"Brick," she said then, roughing his red hair with her hand, as she loved to do, "how is our money? Are we doing well? Could I, do you suppose, have another maid at the house, if I could get a good one?"

"Another maid?" he asked. "Sure, queen of the roses. There's nothing I'd like better than to see you with a house full of them, as I have no doubt the castle of Brian Boru was in the old days. Have you decided that Anna is no longer able to cope with the labors of our elegant dwelling?"

Flossie Mae kissed him.

"Anna is a dear," she said, "and I'll never part with her, but if we entertain a great deal this winter, the work may be too hard for her. Leave it to me, Brick dear; the house is my affair, is it not?"

That afternoon Rudge Bean, the cleverest lawyer in Riverbank, came to Darty for his answer and received it. He expressed his joy, with a dozen spasmodic grins, and went back to tell the Eight Big Men that Darty had said he was willing to run again, and Darty did a jig behind his desk. He was one of those who have a lot of boy in them.

The Eight Big Men of Riverbank, who were mighty and usually prevailed, owned the public-service corporations and much else. They had a way of making mayors and unmaking them, and they waited for Rudge Bean in Mr. Doane's office. They had decided to bury Darty so deep that he would never be resurrected.

"We can't put him in our pocket," Bean had said. "He can't be bought. He can't be driven, led or chased. He can't be mesmerized or persuaded. He's a dangerous man for us."

"Why?" old Doane had asked.

"There are a million reasons, more or less," Bean had said, "and one is that he is one of the independent brand of Irishmen; some nine hundred thousand other reasons are the gray-matter cells in the brain of that wife of his, Flossie Mae. She is all for Darty. She is going to try to make a big man of him—a governor or a Senator; and what we want is a man we can handle. We've got to put Darty in a can and solder the lid down tight."

"Well? Who do you offer instead, Bean?" asked Doane.

"We want a man with a dummy wife. We want a lovely nobody. I suggest Samuel Darlington.

The Eight Big Men of Riverbank mused over this name for a few minutes.

"Yes, he will do," said Doane then. "Old family, needy, has to keep up appearances, nothing against him. He'll do. We will begin to boom him today—"

"Oh, no!" said Bean, with his wry smile of cunning. "Never pin-prick an Irishman like Darty. That wild son of emerald sod would rip the world into shreds between now and election-day. No, we'll give him a pleasant narcotic."

"What do you mean, Bean?"

While they bent their heads together, Bean whispered his plan, and they went about the work silently and deftly, as they went about most things. Bean would promise Darty the nomination and the support of the Eight Big Men. He would spur Darty to attack the only other political power—the Gilroy-Penderson crowd—and lead him on to make himself eternally obnoxious to them. Then at the last moment they would "throw" Darty—leave him out of it—and force the nomination of Sam Darlington.

"All on the quiet! Not a peep out of anyone!" said Bean, twisting his face into a smile. "We'll have one surprised Irishman in Riverbank, and he will be as dead as he will be surprised."

Bean hunted up Darty then, and arranged things with him.

"There will be objections," he said. "There will be those who will say you are bound hand and foot by us, but don't worry, Darty. You know what we can do. Your job is to pound Gilroy and Penderson from now until the caucus. Take this attitude—'I don't care who is mayor, so long as it is not one of Gilroy's greedy grafters.' Pound that hard."

"I'll pound it till the cows come home to roost on Riverbank's ship of state with Brick Darty at the throttle once more," said Darty enthusiastically, and Bean went away well satisfied. He grinned an evil grin when he was outside.

Flossie Mae received the news that the Eight Big Men had promised to support Darty and made no unpleasant comment.

"I'm glad it is all settled, Brick," she said. "There's no doubt they can elect whom they choose."

The "whom" was a new one, a touch of elegance she had picked up through associating with Mrs. Doane and Mrs. Benderman. She used it whenever she could.

"Brick," she said presently, "we did not give Anna much last Christmas."

"What?" asked Brick, not catching her meaning at once, for his thoughts were on matters of grandeur.

"I say we only gave Anna a poor twenty-five dollars and a silk dress and a tortoise-shell comb and a plush-covered hot water bag last Christmas, and she is a faithful servant if ever there was one."

"There was also the gold-handled umbrella and the near-seal purse, angel of the world," said Darty.

"Trifles, Brick," said Flossie Mae, "and I know her heart is set on a sweet gold watch as thin as a lozenge, with her monogram all over one side. The new maid I will have by your permission will be a hoity-toity person, and we must not have Anna feeling jealousy and leaving us. Fifty dollars—"

"Ouch!" said Darty.

"Oh, very well!" said Flossie Mae. "I have a hundred or two of my own, if it comes to that."

There was, however, nothing Darty could refuse his wife, and the watch was bought.

"And see that, now!" said Anna with real tears in her eyes as she looked at the wafer-thin watch in its pretty case. "Sure, you treat me too good, Missus Darty! May God bless the ground you walk on, for you and the boss is the salt of the earth if ever there was one."

"Make us plain Irish, Anna," said Flossie Mae, "for salt kills the green sod, and Darty and I would not wish to do that. I'd not wish to be Lot's wife and no good but to be pounded up to use in the ice-cream freezer."

So they laughed over it, and Anna wiped her eyes and set the watch and thought Brick and Flossie Mae were a king and queen, as they were—as much as any may be in a free land.

The days passed. One evening Brick was sitting in his easy-chair with his shoeless feet propped on another chair before him—as is the inborn right of Irish kings, crowned and uncrowned—when Flossie Mae came behind him. She put the heels of her hands over his ears and covered his eyes with her fingers and bent down and closed his mouth with a kiss.

"What is all this, now?" asked Brick. "Are you making a monkey of the Mayor of Riverbank?"

"One of those Japanese ones," said Flossie Mae. "'See no evil, hear no evil, speak no evil,' Brick. I've seen a worry in your eyes. Are you suspecting things?"

"I am that," he admitted. "When the future of a scion o fthe Irish kings is in the hands of the Eight Big Rascals of Riverbank, and there are rumblings of treason—"

"Brick dear," said Flossie Mae, "it is what I feared! The curse of politics is upon you. Be trusting! Be guileless! I had a dream last night."

"I believe in them when you have them, dear heart of the world," said Brick.

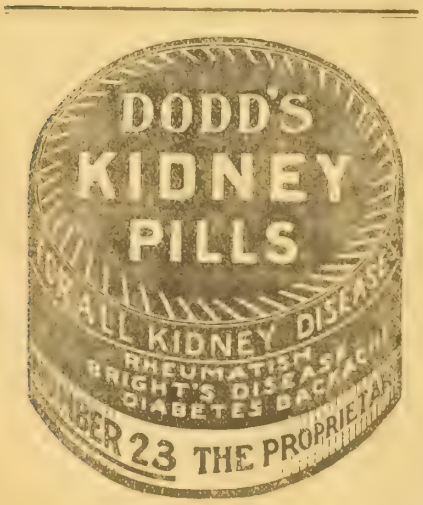
"I dreamed I saw the skins of eight big men nailed to the walls of the humble home of Pat Darty," said Flossie Mae, "but on the roof was the skin of one Rudge Bean stretched out like a parchment, and these words painted on it: 'Remember Flossie Mae!'"

Brick cogitated in silence.

"A wife that has no faith in her husband," he said presently, "and does not tell him the goings-on of her mind, is like a nettle in an undershirt."

Flossie Mae laughed.

"I mean there is treachery afoot, Brick dear," she said; "but forewarned is forearmed. The Eight Big Men and



GOT UP IN MORNING WITH HEADACHE AND SICK STOMACH.

Mr. P. M. Phelps, Stanbridge East, Que., writes:—"I have been taking Milburn's Laxa-Liver Pills with such good results I thought I would write you. I had stomach and liver trouble, and would get up in the morning with a headache, stomach sick and feel dizzy. After taking two vials I was cured of these troubles, and constipation as well."

Carelessness and neglect, and oftentimes wilful disregard of nature's laws will put the system all out of sorts. The stomach becomes upset, the bowels clogged, and the liver inactive. To bring the system back to its normal state must be the object of those who wish to be well. This can quickly be done by using Milburn's Laxa-Liver Pills. They liven up the liver, get the bowels back to their normal condition and tone up the stomach, making the entire system sweet and clean.

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Toronto, Ont.

Why You May Not Succeed

If you fail in life, it will be for one or two reasons—lack of purpose, or lack of willpower. If you really want to do something and be somebody, and have the power of will to compel yourself to pay the price in effort, you can realize your ambition.
Do not fail.

Advertise in the Farmer

their Bean are proclaiming you as their candidate, and the Gilroy gang have settled upon old Enoch R. Miller again; so the town is saying it will be Darty against Miller this time as it was last. Not a whisper of any name but yours has come from the Eight Big Men. But—"

"You mean there is treachery. The hand I hardly bit at all when it fed me is going to give me a clout over the head?"

"Listen, Brick," said Flossie Mae. "You don't suppose I gave Anna a watch in mid-year for the pleasure of spending your good money, do you? The man the Eight Big Men mean to run against Miller is Sammy Darlington."

"A well-tailored lapdog," said Brick. "But how do you make that guess?"

"It is no guess, but a certainty, Brick," Flossie Mae assured him. "You know the business Sammy Darlington is in at the moment?"

"Agent for a London tailor," grinned Brick.

"And you know the clothes Rudge Bean wears? They come off a shelf and the white labels have to be cut off them before they can be worn in publice. No tape-measure has touched his form since he was a babe. What would happen if he had a suit made to order?"

"The end of the world," said Brick.

"And that is not due yet," said Flossie Mae. "So I put one and one together—"

"Wiat a bit," said Brick. "You go too fast for me."

"Well, Anna has a brother Joe, has she not?"

"A fine lad, and he has an easy job in the office of Carter, in the Opera House Block," Brick admitted.

"From the window of which he can look down into the office of Rudge Bean," said Flossie Mae, "and eight times this last week Sammy climbed the stairs to the office of Rudge Bean with his sample-book under his arm and held conversations with the right-hand man of the Eight Big Men. Three times he met Doane there, and once it was Doane and Benderman. Now, there are eight good reasons why Sammy Darlington would make a good candidate for mayor. The first is—"

"I know all of them," said Darty. "I have been blind!"

"Continue to be," said Flossie Mae.

She whispered rapidly in his ear, and as she whispered, he grinned and from time to time nodded his head.

"There's none so keen-sighted as them that pretend to be blind," he said at length. "Hang the sign around my neck and fetch me the dog."

"Whom," said Flossie Mae, with an accent on the "whom," "whom the gods would destroy they first make tricky."

"Meaning the Eight Big Men," said Brick, "and not yourself."

"Women are never tricky," said Flossie Mae with a toss of her head. "Women are diplomatic."

Rudge Bean, the cleverest man in Riverbank, was rubbing his hands in gleeful satisfaction and grinning at nothing but his general pleasure with the way things were going at just the minute when Mrs. Doane, in a superb satin morning-gown, came down from her room in her home some two miles from Bean's office. She had had her breakfast in bed and felt well satisfied with life, but as she made the turn in the stairs, she stopped short.

"Mary!" she said sharply.

"Yes ma'am?" the maid answered.

Mrs. Doane could scarcely believe her eyes. Mary was sitting on the hall bench reading the morning paper, when she should have been dusting.

"Are you ill?" asked Mrs. Doane, as if nothing else could account for the girl's remarkable behavior.

"Oh, no ma'am!" said Mary. "I'm quite well. I was just waiting for you to come down. I want to give notice, ma'am."

"Mary! What do you mean?"

"I'm giving notice, ma'am, as plain as I know how, that I'll be leaving you in two weeks," said the girl. "I've a better place offered me, with less work and more wages, ma'am, and a girl must make the best of her chances while she has them."

"Very well!" said Mrs. Doane grimly. "I trust you will not be sorry. Send cook to me."

"Yes ma'am," said the girl, and went to the kitchen.

The cook came.

"You've had no quarrel with Mary, Agnes?" asked Mrs. Doane. "She tells me she is going to leave me. Do you know why?"

"Nothing but the same reason I have, Mrs. Doane," said the cook. "I've been offered an easier place, with less work and better wages; so I will take this opportunity, ma'am, of giving fair notice and warning. Of course, ma'am, I'll let you have the two weeks to find some one—"

"That will do!" said Mrs. Doane sharply. "You may go back to the kitchen. I will speak to you later aobut the matter."

She looked at her wrist-watch and make a brief calculation. Mrs. Benderman, she knew, always did her own marketing,—in state, in the Benderman carriage,—and she should be downtown at this moment. She went to the telephone and called up the Benderman house. Jane, the unexcelled Benderman maid, answered, as Mrs. Doane had hoped she would.

"Is that you, Jane?" Mrs. Doane breathed into the receiver. "Mrs. Benderman is not in? Well, it was you I wanted to speak to, Jane. You know how ilght the work is in my house, and what a pretty room I always have for my maids? I'm letting Mary go, and I thought I would offer the position to you first of all—"

"Yes ma'am," answered Jane. "I'm sure I'm very grateful, but I've made other arrangements. Cook and I gave Mrs. Benderman notice this morning, Mrs. Doane, because we have a better place in view."

"Indeed!" said Mrs. Doane coldly. "You do not think you care to reconsider?"

"No, ma'am—I'm afraid not."

Mrs. Doane hung up. Her face was rather red now, for while she would have been willing to bear the Benderman reproaches if she could have stolen the Benderman maid and the Benderman cook, she dreaded those reproaches when her attempted theft had been unsuccessful. She hesitated with her hand on the receiver and then removed it from its hook and called the Farrington number. She was less lucky here, for Mrs. Farrington herself answered. As a matter of fact, Mrs. Farrington had called the Doane number and was saying "Hello—hello!" When the two ladies heard each other's voices, they were momentarily abashed. Each had hoped to get the other's maid on the wire.

In the eight homes of the Eight Big Men of Riverbank, and in the home of Rudge Bean, nine maids and nine cooks had given notice that morning!

Flossie Mae chose that afternoon to make a few calls—about nine of them. Before she left the house she called Anna to draw down the flimsy underskirt of her gown.

"And they all agreed, Anna?" she asked.

"Every one of them, ma'am—the whole eighteen. You can trust them all, Mrs. Darty, and not one of them will say why they've given notice. It was all agreed and sworn to at the meeting of the Domestic Servants' Union night before last, and they'll be faithful and true to the last. The way I put it to them they'll never give in, for they know no one but Mr. Darty would ever plan to start a Municipal Employment Bureau for us poor girls. Mum is our motto, ma'am, until you give the word."

"That is nice, Anna. I do thank you. Does it hang all right in the back now?"

"Yes, ma'am; it just needed a little pull. It's like I told them, ma'am. The Bureau will be a great thing for all the girls that want places, and by having the nineteen best of us to start with, the Bureau will get a grand reputation immediately, and all of them can get places in a minute, being the best to be had anywhere."

"Exactly!" said Flossie Mae. "I do thank you, Anna."

In making the rounds of her calls, Flossie Mae said nothing of the proposed Municipal Bureau for Domestic Servants. She spoke, with due indolence and negligence, of the success Darty was having in his business, and expressed her gratitude to the world in general for it.

Mrs. Doane, who had the pleasure of her first visit, listened with no great satisfaction.

"I suppose," she said rather sharply, "you'll be hiring another maid or a cook soon."

"Mr. Darty has said he is willing," said Flossie Mae modestly. "He is willing to let me have another maid and a cook now. I've been making inquiries, but I have not decided whom I shall hire."

"Humph!" said Mrs. Doane, and bit

IT PAYS TO BUILD WITH BISHOPRIC

BISHOPRIC STUCCO BOARD gives a warmer, drier, better barn—and enables you to do most of the work yourself, if necessary—at a saving of 25% to 50% compared with sheathing, lumber, metal lath or lath and plaster. **BISHOPRIC STUCCO BOARD** is the cheapest and best background for stucco for outside walls, and plaster for inside.

HEART PALPITATED

FAINT AND DIZZY SPELLS.

WOULD FALL DOWN IN FAINT.

Palpitation of the heart is very often accompanied by weak, faint and dizzy spells, and is generally caused by some sudden fright, or associated with conditions of a nervous breakdown, but whatever the cause, it is of considerable importance that the heart should be strengthened, and brought back to its regular beat.

Milburn's Heart and Nerve Pills are just the remedy to do this for you.

Mr. Henry Fawcett, Killam's Mills, N.B., writes:—"I have used Milburn's Heart and Nerve Pills for heart trouble. I was very weak and run down, my heart would palpitate, I would take faint and dizzy spells, and sometimes I would fall down in a faint. I started to take your pills and I must say they have done wonders for me. I will always speak a good word for your Heart and Nerve Pills."

Milburn's Heart and Nerve Pills are 50c. a box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited.

her lips.

"There are so many good ones," said Flossie Mae, which was not at all true, as Mrs. Doane knew. There were, at the outside, hardly ten good maids in all Riverbank, and not over nine good cooks. Anna was one of the good maids, but the wives of the Eight Big Men of Riverbank were conscious that they had cornered all the others.

Mrs. Doane answered absent-mindedly the words that Flossie Mae spoke during her call. When Flossie Mae arose at the end of her call, Mrs. Doane did not stand.

"Sit down, Flossie Mae," she commanded. "I want to know what is at the bottom of all this."

"All what, Mrs. Doane?" asked Flossie Mae.

"Now, I wont have any of that!" said Mrs. Doane. "I like you, Flossie Mae, and you know it. I took you up when you came to Riverbank and married that terrible red-haired genius that you have made mayor, and I like him well enough too. He is an amusing person."

"He wouldn't be half so amusing if he was not mayor," said Flossie Mae.

"Humph! I thought so! So that is it, is it? Well, who is keeping him from being mayor, if he wants to be?"

"Dear me!" said Flossie Mae. "Nobody, I'm sure!"

"Now, Flossie Mae," said Mrs. Doane, "I know you and your tricks and manners. I've heard enough today to let me see through a grindstone. I've been telephoning. I know whose maids and cooks have given notice."

"Anna gave me notice," said Flossie Mae innocently.

"Notice, fudge!" said Mrs. Doane. "You couldn't drive that girl away from you with a cat-o'-nine-tails! Notice, indeed! You've done something to get the maids and cooks of the wives of what are called the Eight Big Men to give notice. You can take your pick of them, or send them all out of town. I'm not a fool. You want something—what?"

"I'm sure that I have never done anything to make you think such horrid things of me," declared Flossie Mae.

"Every maid and every cook that is worth having in a house giving notice at once! What do you want?" demanded Mrs. Doane again.

"There is only one thing that I could want, and that has been promised already," said Flossie Mae. "I want Brick to be mayor again, and Mr. Rudge Bean has promised that. The Eight Big Men have promised it."

Mrs. Doane was silent.

"And of course," said Flossie Mae gently, "the Eight Big Men always keep their promises."

Mrs. Doane set her lips in a hard line.

"They will this time!" she said sternly. "If that is what is in the wind, we'll make short work of it, I can promise you! Nine wives to be without help because of some fiddling little politics! Indeed!"

When Mrs. Doane gave her informal tea to the eight wives most concerned and stated her suspicions, there were objections to the plan she proposed.

"For my part," said Mrs. Benderman angrily, "I do not propose to let myself be run over by any such person as Flossie Mae Darty. She comes to town a nobody—"

"And it may be your maid and your cook she means to take," said Mrs. Doane. "She has cornered the market." in Riverbank and is free to take her choice."

"Well, what is to be done, then?" asked Mrs. Benderman.

"Just what I told you," said Mrs. Doane. "We are nine ladies here, and our husbands can make the mayor they choose. They must make Mr. Darty mayor again. I do not know what influence you have with your husbands, but I can speak for myself. Mr. Doane will not deprive me of my cook and my maid, I can tell you that!"

"And if he insists?" asked Mrs. Bean, who was rather afraid of her husband.

"I will cook for him myself," said Mrs. Doane grimly. "I did it before and I will do it again, no matter what the consequences may be. Fortunately—I say fortunately—he has never recovered from the dyspepsia he incurred when I cooked for him last."

"Poor Mr. Bean's stomach is so tender!" sighed Mrs. Bean.

"Men who are as successful as our husbands always have tender stomachs," said Mrs. Doane. "For my part, I mean to give my cook two days' vacation, beginning tomorrow. I am going to be cheerful and brave over it all, and make friend bread as I used to make it just after we got married."

"Dumplings for Mr. Benderman," said Mrs. Benderman grimly. "I have a recipe of my grandmother's. They are delicious until about two o'clock in the morning, but I will have emptied the pepsin down the drain. I will take a nap in the afternoon so I can sit up in bed and talk to Mr. Benderman."

Mrs. Bean sighed.

"The last time we had my fried steak and onions, we had to have two doctors, one for me and one for Rudge," she said.

"Waffles!" said Mrs. Farrington. "Mine are limp and leathery. Dear Mr. F. puts his hand on his stomach and closes his eyes and groans. He walks for hours and hours with his hand on his stomach and swears when I mention the hot-water bottle."

"I read a recipe a few days ago," said Mrs. Burt, "that sounded so delicious! You take boiled parsnips and mash them and brown them in a dish with cheese and pie-crust. When he eats my pie-crust, Mr. Burt gets green under the eyes and around the mouth. He lies flat on his back and says 'Ah-h! Oh-h!'"

Some five days later Mr. Doane crept into Rudge Bean's office and asked the stenographer where the handy-man was.

"He wont be down to-day," said the girl. "He's not feeling very well."

"Nobody's down!" growled Mr. Doane. "Everybody's sick! I'm done up myself! Get the infernal rascal on the telephone!"

The message was short when Mr. Doane got Bean on the wire.

"Look here, Bean," he said. "You've overreached yourself. I don't know what all the rigramole means that my wife was telling me, but this thing has got to stop! Understand that? You've got to elect this man Darty mayor again. Understand that? No nonsense! He's a good man, and he's made a good mayor—"

"Now, don't you come shouting at me like a wild man, Doane!" Bean shouted back at him. "I wont stand any such talk. I'm a sick man—"

"You do what I tell you!" howled Doane.

"Oh, shut up!" said Bean, who was in agony. "My wife telephoned Flossie Mae Darty an hour ago. Go home and go to bed! You nor nobody else can make me do what I don't want to do!"

He slammed the receiver on its hook; and Mr. Doane, being able to do nothing else to show his anger, slammed his receiver on its hook. For a full minute he glared at it; then he ordered the girl to call Sam Darlington.

"Look here!" he said. "This is Doane speaking. You can't be mayor this time. Understand that?"

"Not this time?" asked Darlington. "Very well, Mr. Doane. When can I be?"

"How do I know?" asked Doane savagely. "I haven't asked Flossie Mae Darty yet. Do you think I own this town? If you want to know when you can be mayor, go ask her yourself!"

IT PAYS TO START THE CHILDREN RIGHT

"Love what I have to do" should be the motto of every mother. Children's wants are so numerous and a mother has such constant demands upon her that she needs to retire within herself often and, no matter how tired she may feel, repeat again and again "I love what I have to do." Then suddenly she will feel fetter, and it will become easier to go on with the task of caring for and training the children. It pays in dollars and cents, as well as in peace of mind and satisfaction of spirit, to devote much thought toward starting the children right.

What are some of the simple ways in which a mother can help her little ones? Let her begin the day happily, no matter how she feels, and never be discouraged nor allow the children to become so. Together mothers and children can learn to be honest, obedient, and faithful.

It should not be forgotten that all virtues thrive best in a healthy boy. Therefore, the child should be given plenty of fresh air, and he should sleep in a well ventilated room, wear clean, comfortable clothes and eat simple food.

The children should be permitted to take hold and help about the house a little. At 4½ years they can wash dishes, and they love to do so. They can also help make beds, brush up crumbs and do many other things. But they must not be nagged at their tasks and mothers should remember that interest in useful work may be most successfully developed by keeping it in the realm of the play spirit.

Apart from the influence of the churches and schools it comes back every time to the parents and the home to develop in the children the simple practices which lead to right and happy living.

The mother should be patient in answering questions, and if she does not know the answer, should try to find out with the children. Fun is as natural as breathing to most children. Try to laugh with them at their simple jokes.

It is very prudent to take a little time at the end of each day, to tell a short story. Stories are not all to be found in books. It is a big accomplishment to learn to do things

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all — young or old.

MRS. M. SUMMERS, Box 309 Windsor, Ontario

Minard's Liniment
Yarmouth, N.S.

in the child's way—things they like to do but which are often denied them because mothers feel they have not time to be bothered.

If the little ones see that father and mother are trying to find something to love in all their trying tasks, home will always be full of sunshine. If there is a fretful child in the flock the mother should find out first if he is being properly nourished; then she should try telling him stories which will take his mind off himself.

Many children are often disaggreeable because they haven't enough of the right things to do, such as games and songs, that provide activity and stimulate the mind and occupations that answer the child's need to be doing and making something.

A most important point for the mother to realize is the necessity of sticking to the lessons she needs to teach every single day until the right habits are permanently formed in the child.

No one can tell a mother exactly the things it is best to do with children, but if she begins to watch and think, read when she can and exchange experiences with other mothers many suggestions will be found to meet the needs She should take a glimpse backward into her own childhood and many ideas will occur to her. And through it all she will find that the children are helping to bring the parents up too. Courage and joy prolong life and parents can well afford to stand and wait, feeling sure that if their motives have been right and they can find something to love even in the hard things of life, their little ones will see and know and will "rise up to call them blessed."

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

SHORT CUTS FOR THE HOUSEWIFE

Keeping the stove blacking in some handy place is quite a problem. Under the sink it becomes too damp or the dish pan drips on it, or it becomes mixed with other things. Have the bottom step of the back stairs put on hinges so as to form a box. Any carpenter can do this in five minutes. The stove blacking can and polishing cloths and brushes may all be kept here.

Many a woman has strained her back trying to put her hat in that hat box on a high shelf without the trouble of taking the box down. Cut the front of the hat box down to the bottom, paste on a strip of linen for a hinge and the difficulty is met. When the hat is removed or returned to the box all that is necessary to push up the cover a trifle, pull down the flap and there is no need of taking the box from the shelf.

Many times after a layer cake has been made and the filling of jelly or soft icing is put between the layers, the layers will slip about and slide off, while the cake is being moved about. Take two clean broom straws (never use broom straws until boiled water has been poured over them) and stick them down through each end of the cake. This will hold the layers firmly together. When it comes time to serve the cake, remove the straws. The holes they make are so small they will not be noticed.

Every housekeeper has experienced that indescribable sensation of trying to step down one more step when she has already reached the bottom of the stairs, especially the dark cellar stairs. And even more dangerous is stepping off with the belief that the bottom has been reached when there remains yet another step. If the bottom step is painted white this danger will be obviated as far as the cellar stairs are concerned. Put on several coats of the best hard white paint and let it dry thoroughly. The housekeeper will soon get used to looking for the white step and there will be no more stumbling.

Baby's playthings scatter themselves all over the house. This is to be expected, but when it comes time to pick them up, the question is, where shall we put them? Baby will want them again the next day and they must be conveniently handy for his use. Cover an empty soap box with cretonne or colored burlap. Make a cushion for the top and put padding all around the edge. Then if the cover falls on baby's fingers it will not crush them. Insert castors, the sort with flat bottoms that go on with screws, and paste colored pictures on the sides of the box. This toy box may be moved about the room with a push of the foot, and the playthings will be ready for the next day.

LAUNDRY NOTES FOR WASHING AND IRONING DAYS

A spoonful of salt added to the starch on a windy day will prevent it from blowing out of the clothes.

A little washing-blue in the "boil" suds will whiten clothes wonderfully.

Very thin handkerchiefs may be slightly stiffened by adding a small quantity of hot-water starch to the blue-water.

Always iron embroideries on the wrong side.

If a little kerosene is added when boiling the clothes they will require less rubbing to remove the dirt. The odor of kerosene will not remain in the clothes after drying.

A handy little apron, which makes hanging up clothes much easier, is made by taking two-thirds of a yard of ticking and finishing one end with a band, as you do an apron. Next turn up nine inches at the bottom and sew at each side and through the middle. This will form two pockets for holding clothes-pins, and will save much stooping to pick up the pins.

One of the greatest savings of time and hard work in our family is the jar of soft soap. This we usually make on wash-day, using a liberal quantity in the boiler with the soiled clothing. For windows, wood-work, and cleaning floors or smoked kitchen walls, it is unexcelled. For the glass on pictures or the windows, we usually use a little on a damp cloth, then wipe off directly with a soft dry cloth, or it may be added to the water.

To make, shave one bar of good yellow laundry soap in one quart of water; add two tablespoonfuls kerosene and one tablespoonful borax-powder. Boil down to one pint, and pour in some handy large-mouthed jar or pitcher.

BUTTONHOLES IN SILK

In making buttonholes in a waist of foulard silk I found, after cutting the hole, that it frayed most dreadfully. At once the thought struck me that if I would lay a piece of "mending-tissue" in the hem that the holes were cut in, and press with a hot iron, it would form a substantial body to work on. This I did, and was very successful indeed.

A broken vow is not a tragedy, but a broken courage, a broken will toward the right, is.

IT MEANS MILK

"We are losing every year 300,000 children under five years old, a third of whom die from preventable causes." Thus speaks Mrs. Ira Couch Wood, chairman of tre Child Welfare Committee for the Illinois Council of Defense. Continuing Mrs. Wood says:

"One of three things is the matter —either they are not getting enough food or they are not getting the right kind of food, or they have physical defects which could be remedied to make for proper growth. We have a very small percentage of people who cannot secure enough food. It is not a matter of poverty but of ignorance. Parents need education and re-education to bring home the fact that there are standards ni child development and that the proper food in the majority of cases will bring the child up to the standard.

"Our children should be one hundred per cent perfect in this great free country where we have boasted that every man has his chance. Of course, some will be handicapped by heredity, but if our children are fed properly, we should be the foremost nation in the world. It means milk and butterfat and plenty of green vegetables, very little meat, and you get a sound diet for children."

A Happy New Year :

Now that Munition Contracts are cancelled, we are able to resume regular work. It is gratifying to know that our efforts have helped attain a splendid final victory.

We will appreciate enquiries and orders for general foundry and machine shop products.

WOMEN'S INSTITUTE VICTORY CELEBRATION

Splendid Programme Descriptive of Women's Part in the War and What Her Work Must Be In Order to Hold Ground

A "Victory Celebration" program was carried out at the Women's Institute meeting of Friday, Dec. 13th.

It consisted chiefly of a description of woman's part in the war, and what her work must be now in order to keep the ground she has won. She must "Carry on"—she must look toward a greater and more glorious victory.

Woman threw herself whole-heartedly, unselfishly, and efficiently into every line of work during the war, and her efforts must not in any way relax now that the great reconstruction period is upon us, and with the Allies, and especially the British Empire, rest such huge responsibilities.

The first number on the program was a most excellent paper written by Mrs. Chestnut,—"Canada's part in the war."

Next, Mrs. King gave an account of Red Cross work from its foundation to the present, dwelling particularly on Canada's part, and our own province during the lats four years. It was astounding the amount of money and supplies sent across to England and France.

Mrs. J.E. Keith told how the soldiers Comforts Society has helped to make the life of the men in the trenches both comfortable and happy, and of the men's grateful acknowledgement of the same.

Mrs. Steeves talked about the Canadian prisoners in Germany. Her account of their privations and sufferings came first hand and was very interesting.

Mrs. Slipp, to show us a mother's experience, read a poem telling the story of one mother who had sacrificed everything in order that her son might grow up physically, mentally, spiritually, the very best—

"I never could be satisfied with less."
Yet when the call of his country came, she would have him ready to defend his home, his mother, and his country's flag.—

"He's gone! Dear God! With bleeding heart I know
I still could not be satisfied with less."

Mrs. Jonah described the hard lot of the women and girls in the munition factories. Their lives and their health were so constantly in danger, that their self-sacrifice was no less than that of the men in the trenches.

Mrs. Sterling Parlee and Mrs. Frank Roach talked of the work done by women on farms, in the workshops, in the manufacture of ships and air-ships, and even building huts, which were in some cases made in England, carried to France in parts and set up there. Mrs. Roach spoke particularly of the part women did in taking the place of animals in doing farm work in France. Returned soldiers speak of it as quite a common sight to see a plow drawn by two or three women. Thus they had kept things going and saved their beloved France.

Miss Burgess had been given the subject of food conservation, and gave an account of the very excellent work done by the young girsl in canning vegetables, fruits, meats and fish. These girls had also been knitting and sewing for Red Cross.

Mrs. Robinson related facts and stories to show how all, from the least unto the greatest had depended on prayer and the power of God and had not hesitated to ask for His help, and to acknowledge the same.

Then came a paper by Mrs. Humphrey's entitled "What next". This was so good, and so useful to us all at this critical time, that Mr. Humphreys has been prevailed upon to allow the Record to publish, and it will appear next week.

The more entertaining part of the program was both pleasing and inspiring.—

Mrs. Eveleigh recited "Our Flag the Union Jack"; Mrs. Elliott—"The Birkenhead Drill", and Master Sydney Hargreaves—"Ye Mariners of England".

Mrs. King sang "Rule Britannia" and Mrs. King, Mrs. Forsythe and Miss Gretchen Mills sang most beautifully as a trio, "The men of Harlech."

As usual Miss Sherwood helped in her own special way at the piano.

The Women's Institute of Hillsboro held an interesting session at the home of Mrs. L. M. Stabell on Saturday afternoon, Dec. 7th. Mrs. Karl Duffy, 1st Vice Pres., presiding in the absence of the President. The roll was answered by a "joke".

Four new members enrolled, paying dues.

Miss Mina Stiles, Miss Ina Steeves, and Mrs. Fred Erb were appointed a press committee.

The convenor of the yarn committee reported the buying of more yarn and distributing the same.

Fifteen ($15.00) dollars was voted for the St. James Military in St. John to be used in the diet kitchen.

Mrs. Chas. Steeves, convenor of the shipping committee, reported the shipping of twenty (20) boxes and two (2) bundles of socks to boys overseas.

Miss Ina Steeves read a very interesting paper on "Christmas Customs".

Mrs. Robertson gave a short talk on the "Value of Enthusiasm" and afterwards sang a solo, which was much enjoyed. Twenty three members were present.

Meeting closed with singing the National Anthem, followed by The Woman's National Anthem.

J. M. ERB, Secy.-Treas.

Hillsboro, N. B.
Dec. 16th, 1918.

"If I Could Only Be Strong and Healthy Like Other Girls."

THIS is the longing of the girl who is pale, weak and anaemic.

She is lacking in energy and strength, and is so easily tired out that she does not feel like taking outdoor exercise or joining others in social gatherings.

The healthy, happy outdoor girls get in the way of leaving her to herself, and she gets lonely, discouraged and despondent.

The source of trouble is in the condition of the blood, which has become thin and watery, and utterly lacking in nutritive qualities.

The anaemic condition is shown in the pallor of the lips, the gums and the eyelids, as well as in the pale face and angular form.

Nature has provided for the purifying of the blood by having it sent to the lungs periodically to come in contact with the fresh air and take up new oxygen.

Unfortunately this plan of nature has been defeated by human beings living too much indoors and breathing over and over again the vitiated air of ill-ventilated rooms. This is the usual cause of anaemia, as well as a reason for its continuation.

The blood gets ever thinner and more watery, until the human system is literally starved.

The digestive system has failed, and your health must go naturally downhill until you can find some means of restoration.

Fortunately, Dr. Chase's Nerve Food furnishes the vital substances needed for regenerating the entire organism when in a run-down condition.

Gradually and certainly the building-up process is established, and the pure, rich blood created in the system carries health and strength to every part of the body.

Weakness and disease, the cause of discouragement, failure and unhappiness, give place to new hopes, new confidence and stronger determination to succeed.

The appetite is sharpened, digestion improves, and you find yourself enjoying your meals and taking a new interest in life. As you gain in strength and energy you feel encouraged to keep up the use of this restorative treatment until thoroughly restored to health.

The rosy cheeks and healthful appearance of people who have used Dr. Chase's Nerve Food is its strongest recommendation, and accounts for its ever-increasing popularity.

It is for sale by all dealers, 50 cents a box, 6 for $2.75, or by mail from Edmanson, Bates & Co., Limited, Toronto. Look for the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author, on the box you buy.

OUR COUNTRY SECTIONS IN THE WINTER SEASON

(Contributed)

In the large towns and cities they have all sorts of attractions and meetings to interest people and take up their attention during the long evenings of the winter season, from November to April. How do they get along in the country districts? How do they pass the time there during these six months? Well, all that mainly depends upon the people themselves, upon those who live and labor in rural communities. If the people in a rural district are intellignet, go-ahead and thorough believers in improvements of all kinds, they will go to work and make their particular district a centre of light and attractive force during the long evenings of winter. If the church-going people in that district act up to their profession, the various societies in connection with the church such as the missionary societies, the Y. P. S. C. E., and such like, will often hold entertainments, and not only provide an evening's pleasure, but bring out the latent talent that is in that particular secion. Then what is to hinder one or more of these societies, with the minister at their head, from providing a course of lectures from well known public men on popular subjects. That would be a good act, and would result in a great deal of benefit. If there is a temperance society, division or lodge in the district, nothing should hinder them from giving a monthly entertainment of an evening of addresses, readings, recitations, dialogues, songs and instrumental music. The farmers of that district might hold monthly meetings, and discuss intelligently and impartially certain subjects in connection with their calling; an dwe are sure such meetings where there would be an interchange of ideas and opinions, would be very helpful and beneficial. The Red Cross and what Patriotic Societies may be in operation could also provide social evenings of entertainment, that would be profitable as well as pleasing. In fact, we can hardly refrain from asking the question, what could not be done, if our friends in the country would only set to work and do it, to provide abundance of entertainment, pleasing, profitable, humorous, helpful, and attractive, during the long evenings of winter. It is up to them now to consider what they might do, if they tried hard enough, and what could be done. To all our friends in the rural district we would say, go right to work and do something in this particular direction. Take an interest in the section you live in, and try and make the hall in your locality, if you have one, or the school-house, if you have not got one, or even the church, a centre of light to the community during the winter. And when you have decided to go ahead and do this good work, let all hands hold a public debate and argue and settle the question, what shall we do?

Suppose we all go to work now and do something in this line. The war is practically over, and Canada will soon enter upon a new life; a life of reconstruction in every department. Each country section as well as every town and city will be called upon for a decision. We must not only work but we must improve and improve. Let us all do our own part in this grand work.

But there is one thing that used to be a very common attraction and pastime, in almost every country section, especially in the fall and winter season. That was the singing school. That was the place where the young men and women, yes, and some of the older ones, would congregate. That was where the singing master, generally a man that had a good knowledge of vocal music, who could sing well, and who generally led the choir in some church, would teach them not only to sing, but read music. Those were the times when the old Harmonicon, the Dulcimer, the American Vocalist, and some others of the old-time music books would be in circulation and well-handled in the majority of country homes, especially on Sunday afternoon or evening, if it happened that a number of friends would gather in a neighbor's house, and spend an hour or two singing the old major and minor tunes that have gone out of use altogether. There was a time when all who had good voices would sing the praises of God in church, in prayer-meetings or in any religious gathering. They would sing heartily and with spirit. Now, besides the choir there are only some who sing. It has been often asked, why is there such a decline in congregational singing? One reason is the disappearance of the old-time singing-school. It was the singing school and the singing master who was at the back of hearty and effective congregational singing. Would that there was a music teacher in every important country section, and that he taught a singing school three or four months in the year. What an advance there would be made in the divine art of music, especially sacred music. It would be an uplift certainly.. Social life, especially in the country, would be made more attractive. When the singing school is revived and the singing master of other days return, life in our country districts will become brighter, and the good effect will follow in the course of time.

$5.00 for $4.00

The Dominion of Canada, in accordance with Order-in-Council P.C. No. 2462, offers for sale in Money-Order Post Offices, Banks and other authorized places, the 1919 issue of

War-Savings Stamps

"War-Savings Stamps will provide financial assistance to the Government, an excellent investment for small savings, and a strong incentive to every-day economy."—
Sir THOMAS WHITE, Minister of Finance.

A WAR-SAVINGS STAMP is Canada's promise to pay Five Dollars on January 1st, 1924. It costs you $4.00 if purchased before January 31st, 1919, and the purchase price increases one cent each month after that date.

The difference of one dollar represents the high rate of interest earned. W-S.S. are a splendid investment for every man, woman and child in the Dominion of Canada.

Certificates are issued providing spaces for ten W-S.S., and in order to protect you against loss through fire, theft or other cause, you may register a certificate, with one or more W-S.S. attached, at any Money-Order Post Office. A Certificate registered in your name is of no value to anyone but yourself.

THRIFT STAMPS are also on sale and cost 25 cents each. These bear no interest, but they help you to save to buy a W-S.S.

Sixteen Thrift Stamps on a Thrift Card will be exchanged for one War-Savings Stamp.

You have all the resources of the Dominion back of your investment in War-Savings Stamps, and if at any time circumstances compel you to realize on your investment, your money is available.

RESOLUTIONS TO MEND

One man said, "No, I don't make New Year's resolutions. What's the use? You are sure to break them and then you stop trying."

I hate that point of view.

It is one of the half truths that do more harm than lies.

A Broken Vow is Not an Absolution

Doubtless vows do do harm when one feels that in breaking them one has been absolved from trying again until next New Year's Day. But why on earth should one feel that way?

New Year's resolutions may not accomplish miracles. Few things do. But they are a step in the right direction. They don't furnish the stick-to-it-iveness. We have to do that ourselves. But they furnish a definite goal. They trace out a path. And most of us travel better in a path.

I think we all ought to reckon up our character accounts on New Year's Day. We need such stocktakings sorely. There are businesses whose owners never know whether they are solvent or not because they never take stock properly. And there are individuals who never know whether they are solvent in the business of living, whether they are getting on any from year to year, whether their assets are greater than their liabilities, because they never stop and take stop.

Stop Today and Take Stock.

So by all means take stock on New Year's Day and then make your vows to stop the leaks, and to make more progress in the coming year.

Don't make the vows too ambitious and all embracing, and don't expect that they will be broken. But if, by any chance they should be broken don't throw them away in the dust heap of broken vows and other unpleasant memories.

Just As Good As New

Just pick them up, patch them together with the cement of new resolution and undauntable courage and go at it again. If you will honestly and thoroughly use those that remedy you will find them every bit as good as new.

"It is not vows that keep the world right, but the prayers of a man's soul from day to day."

FOOD PRODUCTION MUST BE INCREASED

The horse is a vital factor in such accomplishment. His efficiency is measured by the degree of fitness for constant use.

Stuffed Collar Pads

Are the only guarantee against bruised, galled and chafed shoulders. They are better than other kinds, being soft, springy and absorbent. They make possible the continued use of a horse collar long after its worn condition would otherwise compel its discontinuance.

New Patented Hook Attachment

(Found only on pads made by us)

Consists of wire staple with felt washer. It gives hook a firmer hold and prevents pulling off, even though fabric is weakened by long usage. This is the greatest improvement since we invented the hook.

MARKET REPORT

CHARLOTTETOWN

Dec. 27th, 1918.

Beef, Ox, carcass, 18c; retail 22 to 24c.

Beef, cow, carcass, 16c; retail, 20c to 22c.

Veal, none.

Hogs, carcass, selects, 21½c, organs included.

Lamb, carcass, 22c lb.

Mutton, carcass, 18c lb.

Beef Hides, 15c lb.

Sheep Skins, $3.00 to $3.50.

Calf Skins, 30c lb.

Potatoes, 50c to 60c per bushel.

Carrots, 1¼c per lb.

Turnips, 20c per bushel.

Parsnips, $1.75 to $2.00 per 100 lbs

Oats, 80c to 82c per bushel.

Cornmeal, $3.90 to $4.10 per 100 lbs.

Bran, $2.20 to $2.30 per 100 lbs.

Oatmeal, $6.00 to $6.25 per bag.

Middlings, $2.40 to $2.50 per 100 lbs.

Oil Cake, $3.75 to $4.25 per 100 lbs.

Ontario Flour, $12.25 to $12.50 per bbl.

Manitoba Flour, $12.50 to $12.75 per bbl.

Chickens, 28c to 33c per lb.

Fowl, 20c to 22c per lb.

Turkeys, 35c to 40c per lb.

Geese, 30cto 34c per lb.

Butter, Creamery, 50c to 53c.

Butter, Dairy, 40c to 45c.

Cheese, 27c to 27½c lb.

Eggs, 53c to 58c per doz.

Hay, 95c to $1.00 per 100 lbs. loose.

Hay pressed, $18.50 to $20.00 per ton

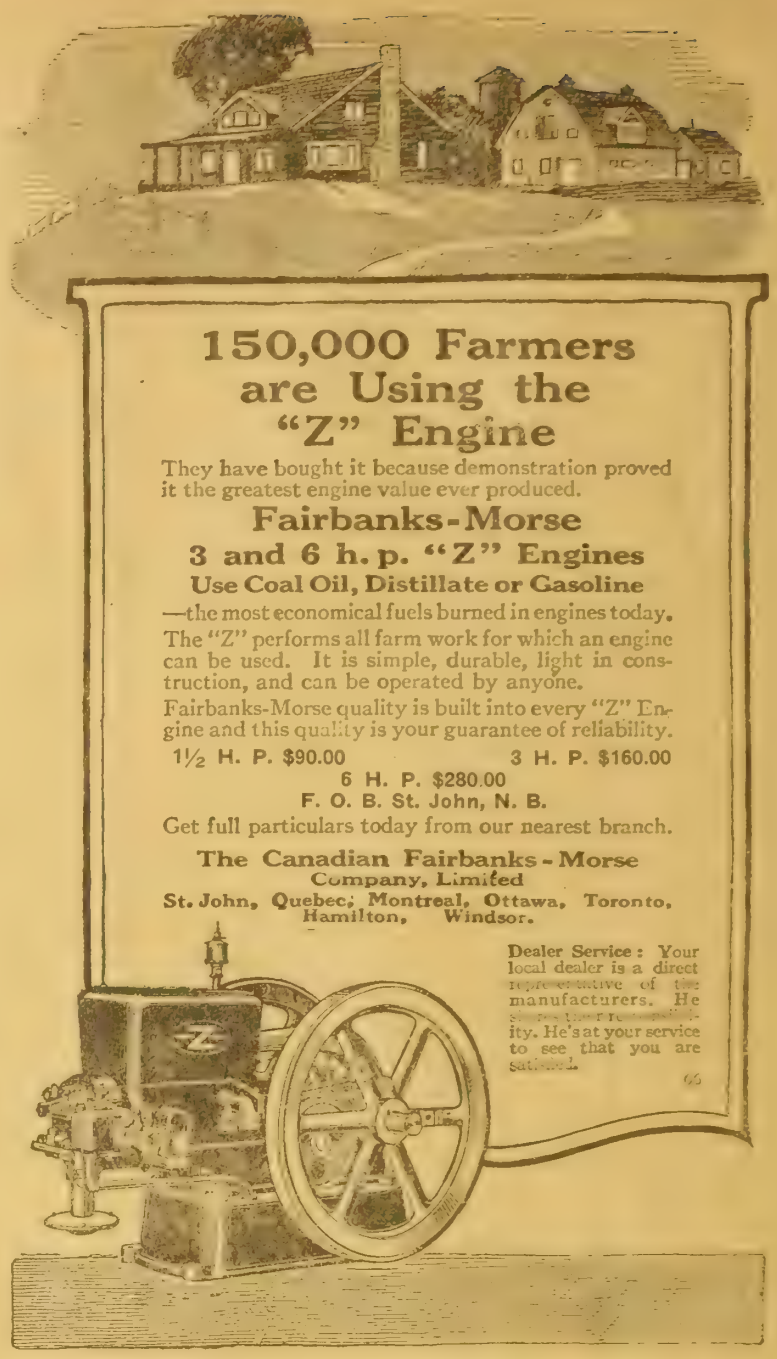
Straw pressed, $12.50 to $14.00 per ton.

MARITIME PROVINCES SHEEP IMPROVEMENT POLICY

By Norman Stansfield, Acting Chief, Sheep and Goat Division

As a war measure and for one year only it was decided to change the policy of distribution of pure-bred sires in the three maritime provinces this year. The old policy of distributing pure-bred sires to live stock associations has, undoubtedly, accomplished great improvement in the districts where these sires have been placed, but it was felt that the improvement was not as fast as it might be. Therefore the policy has been changed and the following method was inaugurated as a war measure for one year only and to test out the workability of the policy.

The Dominion Live Stock Branch co-operated with the provincial departments of agriculture in the work of distribution of sires and encouragement of the sheep industry. The provincial departments of agriculture notified the sheep raisers within their provinces, through the medium of advertisement, that it would be possible to obtain pure-bred sires at very little above the market value of grade sires, and pointed out that under such circumstances there was no excuse for the using of grade sires. After all applications were collected and tabulated, the pure-bred rams within the province were purchased by the provincial department and re-distributed under this policy. The supply of home-bred rams was insufficient in all these three provinces to supply the demand, so that it was necessary to purchase in other provinces other rams to supply the demand. A representative of the Sheep Division of the Dominion Live Stock Branch, with a representative from each of the three provinces, purchased over 200 rams in Ontario for this distribution policy, and at the same time approximately 200 pure-bred breeding ewes were purchased for distribution by the provincial authorities. Twenty-five dollars was the price at which ram lambs were distributed, and thirty dollars for shearling rams. The work of distribution was in each instance done by the provincial authorities, and the work of collection by the Dominion authorities, the expense being borne co-operatively. In the past the Dominion Live Stock Branch has distributed pure-bred rams and good results have occurred, but this new policy was tried as an experiment to find out if more immediate good might not be the result with the same expenditure.



150,000 Farmers are Using the "Z" Engine

They have bought it because demonstration proved it the greatest engine value ever produced.

Fairbanks-Morse

DON'T SLAUGHTER WHEN ANIMALS ARE OVERHEATED

Wm. H. Fieldman, of the Colorado Agricultural College, has pointed out the inadvisability of slaughtering meat animals when overheated, giving the following information:—

It often becomes necessary to slaughter animals which through accident or otherwise have become injured. In many instances the flesh of these animals is edible if the proper precautions are taken before killing the injured beast. The essential point in this connection is to allow the animal to become thoroughly cool and recovered from any excitement incidental to the injuries. To slaughter an animal that is over-heated from any cause is prohibited in all government supervised packing plants, for carcasses of such animals will not bleed out properly nor will the meat from such an animal have keeping qualities, no matter what means may be taken to preserve it. Serious poisoning and death may result from eating such meat, which is usually very offensive to the taste and smell.

ONTARIO OFFERS FEEDS

Attention is called to the advertisement of the Resources Committee of the Province of Ontari which appears in other columns.

Last year when the scarcity of feeds was apparent the Ontario Government arranged for the manufacture of 1500 cars of Standard feeds. The War has relieved the sitution and now some of these feeds will be available for the Maritime Provinces and other parts of Canada. Feeds are being offered at $67.00 a ton delivered Maritime Province points. Those interestde will do well to read the advertisement which appears on page 197 of this issue.

REMEDY FOR STRINGY MILK

Stringy milk is caused by bacteria which enter the milk after it has been drawn from the cow. It is not caused by the feed or any abnormal condition of the cow. Milk affected in this way is not unhealthful, but it is certainly not appetizing. The bacteria which cause the trouble live in water ordinarily, and probably enter the milk from the cows' bodies, or from utensils. Where trouble is had from this condition, the utensils, especially the strainer cloth, should be boiled. If this treatment does not eliminate the trouble, the fresh milk should be heated on the stove to a temperature of 150 degrees, then let stand 20 minutes and cooled as uickly as possible.

SHOULD COWS BE FED TURNIPS?

This is an old question about which considerable difference of opinion exists. If my reader is Scotch, he or she will likely answer the question by saying "Yes," as Scotchmen, turnips, and good farming are three things usually found together on farms in Canada.

There was a time when butter buyers were not so particular about the flavor of butter as they are at present. It is common to hear women purchasers on city markets, say to farm butter-makers, "Your butter is turnipy," which is sufficient to cause a loss of the sale. Creamery-men object very strongly to "turnipy cream." While it is doubtless true that some careful feeders are able to feed quite large quantities of turnips to cows giving milk, without causing any serious trouble, there is always danger, which can best be avoided by not feeding these to milking cows. If they are grown on the dairy farm they are best fed to dry cows, fattening cattle, young stock, pigs, etc. However, if they are fed in the stable where cows are milking, and more especially where the root house opens into the stable and where the turnips are pulped in the stable or in a feed-room adjoining, the odor of the turnips fills the air, which is carried into the milk pail at the time of milking and thus the milk, cream, and butter become tainted from the stable air, even though the milk cows may not be fed any of the turnips..

The safest plan is not to grow turnips on a dairy farm. Grow mangels, or sugar beets, and corn for silage. These crops will give as good returns as turnips, are no more expensive to grow, and are much safer.

"Safety first" is a good motto on a dairy farm.—Prof. H. H. Dean, Ontario Agricultural College, Guelph.

DISINFECTION AND HORSE DISEASES

Just as much is done scientifically to prevent the spread of infectious diseases among horses as among men. Owners of horses kept in sale barns clean and disinfect their premises when needed, daily, weekly, semi-monthly, semi-annually and annually. All stalls where disease has been discovered, if only a cold, are cleaned and disinfected immediately. Manure is continually being removed.

There is a great difference in the appearance of barns. Some have dirt floors, others cement. Some are good frame structures, neatly white-washed, others are of brick and are disinfected with crude oil compounds. Of late the white-washed barns have been condemned. It appears that hermetically sealed microbes do not die but are only covered up forever and ever. No official has courage enough to insist upon the use of one disinfectant in all places. Perhaps no official knows enough about any disinfectant to underwrite it.

The present influenza is no respecter of fresh air traditions. Soldiers and sailors living in the open air have been as rapidly and as dangerously smitten as those who lived in crowded tenements. The mortality has been greatest in government-cleaned, disinfected and ventilated places. This is no criticism of the Government, merely an observation. It applies equally to horses in cantonments.

Strangles or shipping fever is a disease described 460 B. C. among army horses. The Arabs have proverbs in reference to the control of this disease in camps. Branding a good commercial horse with the army stamp does not make him immune. The healthiest horse jammed into a cantonment paddock along with 499 others has a chance to pick up some infection. Army horses could be kept as free from diseases as commercial horses by exercising the same amount of care. All horses go "through the sweat" in every part of the world. It is only through gross carelessness that virulent diseases get a start among army horses.

George E. Wentworth.
Cook Co., Ill.

MOUSE CONTROL IN ORCHARDS

"Mice in the orchard are allies of the Hun," says R. B. Cruickshank of the Department of Horticulture of the Ohio State University. Further in this connection he says, "that unless the young trees are protected, considerable damage is often done during the winter by the rodent."

As a protective measure he suggests that during the fall or early winter all weeds and rubbish should be hoed away from the trees, leaving the soil clean and well firmed about the trunks to a distance slightly beyond the spread of the branches. A slight mount around the trunk of the tree is an additional advantage.

EASY CAKE WITH ONE EGG

½ cupful soft butter or lard, 2 cupfuls brown sugar, 1 egg, 1 cupful sweet milk, 2 small cupfuls raisins, 3 cupfuls flour, 5 level teaspoofuln of baking powder, 1 teaspoonful each of nutmeg and cinnamon.

Bake this in a long dripping pan 10 by 15 inches.

GIVE FOALS A CHANCE

The first winter is one of the most important periods in a colt's life. The colt that goes into the winter thin and in poor condition has less chance to winter well than the colt that enters winter quarters in good shape. Colts frequently lose bloom and flesh at weaning time. To avoid this is important. They should have learned to eat hay and grain before weaning time; also to be separated from their mothers. A very satisfactory method of weaning is to let the colts nurse in the morning and take them away, not permitting them to see or hear their mothers until the ordeal is over. If they have learned to eat hay and grain they can be weaned and gain in weight during the time. Recently, colts weaned at the University of Missouri College of Agriculture gained 20 pounds each during the week they were weaned. After weaning, a good blue-grass paddock surrounded by fences in which colts cannot injure themselves, plenty of good fresh water and good grain together with exercise and satisfactory shelter, should carry colts up to the time winter sets in, in good condition. Care at this time frequently means the difference between good yearlings and inferior ones, says E. A. Trowbridge. If a colt is worth having he is worth taking care of.

Keep hte stock comfortable. There is probably no term that signifies more regarding the condition in which stock should be kept than the term "comfortable;" and if one bears this in mind, and keeps his stock comfortable—that is, not hungry or cold, or excited, or standing in an uncomfortable position, or sleeping in an uncomfortable bed—his returns will be satisfactory.

In the past eight years South Dakota has nearly trebled the value of her manufacture of butter and cheese. In 1910 it was $8,185,890, and in 1918 it had increased to $23,454,825. Her annual butter production is 35 million pounds, an increase of 75 per cent over that produced eight years ago.

FERTILIZERS !

THE best potatoes grown in N. B. last year were grown with our best by test Potash Fertilizer.

We produce our high grade 2-8-2 and 3-6-5 brands expressly for N. B. potato growing, securing our own potash in Canada, all in water soluble form.

If you are using other makes of Fertilizers try as an experiment some of our brands alongside and watch results.

We produce a full line of Fertilizers. Write us for prices, terms, etc.

CANADIAN FERTILIZER CO., Ltd.

CHATHAM, ONARIO

THE SUCCESSFUL ICE HOUSE

The successful ice house is not necessarily the most expensive one. The secret (of keeping ice) is in the strict observance of four principles all of which finally reduce to one, namely, good insulation. The four principles are: first, there must be good underdrainage to carry off the melted ice, for otherwise it would form a conductor of heat to the remainder of the ice stored, and would gradually melt it from underneath. Water melts ice much faster than air, for the latter merely affects the surface while the former penetrates throughout. Second, there must be perfect ventilation at the top of the ice in order that the covering of sawdust, straw, hay, moss or leaves may be kept as dry as possible so that it will not form a conductor for the heat from the air and melt the ice on top. Third, the ice must be packed so as to prevent the circulation of air through the mass, for there is certain to be some heated air enter into the house when the doors, windows, ventilators, or top are opened. These currents of air rapidly warm up, while dead air does not readily become heated because of the fact that air is a very poor conductor of heat. Fourth, good insulation at the sides and bottom must be carefully provided.

The size of the house needed may be determined from the fact that a ton of stored ice occupies approximately 42 cubic feet of space. The average size of house for a small farm is about ten feet high from the ground to eaves, with an inside area 12 x 14 feet. Afte rallowing for the space occupied by the sawdust around and under the ice, this will give room for the storage of from 25 to 28 tons of ice. A cubic foot of solid ice weighs close to 30¼ pounds, so that 35 cubic feet of solid ice would weigh a ton. From this we can estimate the amount possible to cut from a pond. The thickness of the cakes cut ranges from six inches in the central states to 16 and even 20 inches in the north. Probably 12 to 14 inches is the average. The cakes are cut in various sizes also, perhaps 12 x 16 and 16 x 16 are common sizes, but this is not important. Assuming cakes 12 inches thick and 12 x 16 inches, there will be 26 of them to the ton, each one weighing 76 1-3 pounds. In the field, allowing for breakage and waste, a surface of 50 feet square will harvest 45 tons of 12-inch ice.

Having determined upon the size of house and the outlay of money that can be afforded, it remains to determine the material to be used and the plan to be followed. Beyond any reasonable doubt woo dis better in many ways than stone, brick or concrete for ice house construction, although any of these may be used with satisfaction if the ice is packed far from the walls and well insulated from them by ten or twelve inches of sawdust. The only objection ti wood which any one can have is its tendency to rit under the continued inuence of moisture inside and dryness outside.

BUY REGISTERED SEED

Farmers who contemplate purchsaing seed grain for next spring's sowing, should keep in mind the advantages which they may realize by purchasing registered seed rather than seed which cannt receive any official recognition. These advantages are briefly as follows:

1. Registered seed is more reliable as regards purity of variety, freedom from weed seeds and ability to produce a strong, vigorous growth.

2. Registered seed may be expected to yield from three to five bushels more per acre than ordinary unselected seed of the same variety.

3. Crops from registered seed mature more evenly than do those from unselected seed.

4. Grain harvested from a crop grown from registered seed may in turn be registered providing it is up to standard, is not more than three generations removed from Elite Stock seed, and that it has been properly inspected both while growing and while in the sack prior to shipping. Since registered seed brings more per bushel than does ordinary seed, the financial advantage may be realized from sowing this kind of seed is obvious.

The ability to have the immediate progeny of registered seed recognized as above mentioned is a new departure, but is one which should appeal strongly to the average farmer. It frequently happens that farmers who have a particularly well prepared field to desire to procure from it a supply of seed of outstanding merit. Where registered seed is sown on such a field the chances of harvesting an outstanding crop are especially good. Where such a crop is harvested it is a distinct advantage not only to the farmer himself but the country generally to have the cleaned seed recognized and handled for seeding purposes rather than to be used for feed.

Farmers who sow registered seed next spring, and whose crops are promising during the growing season, should apply to the Secretary of the Canadian Seed Growers' Association, 114 Victoria St., Ottawa, Ont., to have their crops inpsected before they are harvested. This inspection of the growing crop is absolutely essential to an official recognition of the threshed grain.

BETTER STABLES NEEDED

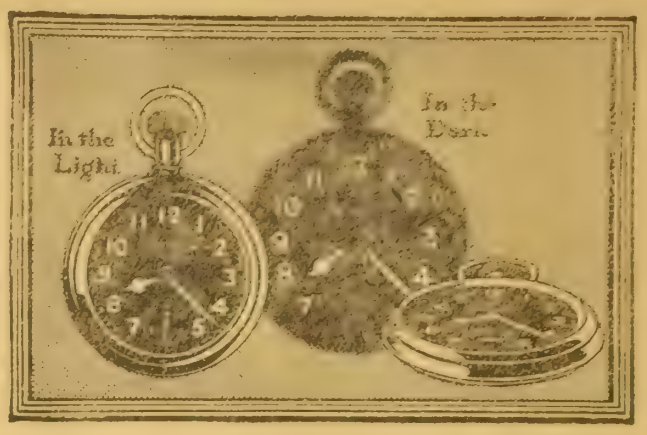
It is the firm conviction of many authorities who have watched the situation for years that many herds of dairy cattle throughout Canada, notwithstanding the fact that they are provided with the best of feed, and plenty of it, are bringing their owners in very little profit because of the stabling condition under which they are housed. To make profitable use of food, a cow must be healthy, strong and vigorous, as the production of milk is a great drain on the body of an animal. When conditions exist that destroy the vigor and stamina, a cow soon comes to the point where she is not able to digest, assimilate and convert into milk a great surplus of feed. To prevent this happening dairymen should do all in their power to shelter their herd in such a way that they will remain strong and vigorous, and then work in the niceties of a perfectly balanced ration. The robust cow will get stuff out of a straw stack the nutrition expert never found there, while the devitalized cow will not get half out of the green alfalfa hay that the investigator put therein. The present is a good time to look about the stable and see what can be done with it.

FERTILIZERS ON OLD HAY LANDS

Nova Scotia farmers buy every year great quantities of fertilizers. To offset this outlay it is of the first importance that the materials used should be used to the best possible advantage. The Nova Scotia College of Agriculture has conducted a series of experiments, the results of which are very interesting and valuable.

Some 600 lbs. of phosphoric acid and fertilizer such as acid phosphate or basic slag, and about 100 lbs. of sodium nitrate were aplied to an acre. Then a third of an acre allowed on which the phosphoric acid was applied alone. This alteration was carried out over a sufficient area to make results conclusive.

The crop grown was oats, the seeding being done early in June. All through the summer the plots treated with the phosphoric acid and nitrate showed a marked superiority over those receiving phosphoric acid alone. When the crop was threshed it was found that in a number of cases the 100 lbs. of nitrate had increased the yield of oats by over 14 bushels per acre. The average increase from the addition of nitrate to the acid phosphate was 8½ bushels per acre. A much more marked improvement occurred with some phosphoric acid fertilizers tha nwith others. A fuller account of the whole experiment may be found oin the 1918 Annual Report of the Secretary for Agriculture. The outstanding fact established is that a comparatively small quantity of sodium nitrate applied with any phosphoric acid fertilizer materially increases the crop returns.



Worth More Than It Costs

THIS watch can be bought at any dealer's for $3.00. It is different from the ordinary watch because it tells time in the dark.

Real Radium in the substance on the hands and figures makes them glow brightly, no matter how dark it is, and this glow lasts for the lifetime of the watch.

You do not need to strike a match to see the hour.

On the farm, in mines, factories, camps, for outdoor work or exercise, you will find a Radiolite much more useful than the ordinary watch. It is indeed worth more than it costs.

More than 50 million Ingersoll watches have been sold during the last 25 years, and Ingersolls can be bought in any town or village just the same as in the big cities—same high quality, same low price. Ask for Ingersoll Radiolites—$3.00—at any dealer's.

Look for the words Ingersoll Radiolite on the dial.

Ingersoll Radiolites

ROBT. H. INGERSOLL & BRO.
128 Bleury Street, • Montreal.

WINTER CARE OF FARM HORSES

It is often claimed that the winter care of horses is much more important than at any other season of the year. In spring, summer and fall they are worked every day, and are fed regularly and liberally watered. They are cleaned at regular intervals, and the labor in the open air tends to keep them healthy and vigorous. In winter when team work is not needed, the horses are often neglected, some days going without being cleaned, and perhaps going for a week or more with no more exercise than they get while being led to water. Many stables are not properly ventilated. The air is breathed over and over again, and becomes noxious in a short time. Under such care and treatment horses soon become debilitated.

A cold stable is to be shunned as much as a badly ventilated one. Horses should not be kept in a dark stable or where they are constantly compelled to face the light. The best way is to have the light admitted into the stable behind the horses. When they are not frequently driven or worked they well littered with straw, and the droppings removed at least once a day. In the winter there is no excuse for not cleaning the horses every day. Practical experience proves that a coarse brush is better than anything else for removing dirt from the skin without annoying the animal.

There is much diversity of opinion as to the best winter feed for horses. If they are heavily grained, and also fed hay, they will prove costly animals by spring, unless they have performed profitable work during a portion of the time. Horses that are kept fat by feeding plenty of grain will not prove as efficient as those which have been kept on less grain. Only as much grain should be fed in winter as to keep the animal in good spirits and fair flesh.

Every farmer has observed that horses will eat too much hay if given the opportunity. If there is good clean oat straw it may be fed to horses in winter if accompanied with a proper allowance of grain. However, several weeks before the opening of spring, hay should be fed, instead of oat straw.

While stable blanketing in winter has many advocates, many good horsemen have never favored the practice. The only time to use blankets is after the horse returns heated from a trip in the cold weather, or if the animal is sick. A horse with proper food and stabling can withstand more cold with less inconvenience and is less likely to take cold from an omission to blanket while waiting on the road, than if accustomed to constant blanketing in the stable.

FACTORS OF UNCERTAINTY IN CALCULATING COST OF PRODUCING FARM PRODUCTS

The cost of production is a wide term when applied to farm dairy products. Consumers who are hard hit by the high cost of living, and who are accustomed to figuring out with accuracy the cost of factory products, will find, when they get a better knowledge of the farmers' business, that calculation on a similar basis is impossible. The cost of producing farm products cannot be figured out as accucrately as the factory cost of factory products. There are so many varying conditions that cannot be computed that there is always a factor of uncertainty about it that cannot be eliminated.

Of course the cost of producing milk or butter fat from the standpoint of cost of feed can be fairly accurately obtained. But the food of production is only one factor. The labor of production must be estimated. Besides we give the cow credit only for the butter fat or milk she produces and estimate that the skim milk and the calf and the manure will pay for the cost of labor, interest on investment, depreciation, etc., Now, in some instances these products will more than pay the cost of labor in fact much more and in other instances it might be a questionable estimate.

Some people do not get much value out of their skim milk because they do not feed it in connection with other proper feeds. This by-product is an unbalanced ration and if not balanced with the right kind of food much of its value is lost. Then too, if fed to well-bred animals, it is easy to understand that one can get a greater value out of it than when fed to unthrifty scrub animals.

It is the same with the calf. If it is well-bred and well born and properly fed and cared for, it is worth much more than if it is only a scrub poorly fed and indifferently cared for. Here again the food cost of butter fat or milk does not always show the correct cost.

With the manure the some conclusions must be drawn. The value of the manure depends in part on the ration fed. Well-fed and liberally fed animals produce manure superior as plant food to those that are underfed or impropely fed. We can't get something out of nothing. Then how is this manure handled? There is a chance for a large part of its value (its plant food) to be absolutely wasted by careless handling. And again if it is carefully preserved, on what crops is it applied and row much is used at one application? There is a chance for great waste or loss for it may be as much of an unbalanced food to the plant as skim milk is to the calf. If it is unbalanced then it should be balanced by adding the plant food nutrient that is lacking.

The three above named by-products of dairying may therefore be so handled that they do not pay for the cost of labor or they may be so handled to much more than pay the cost, consequently the food cost of butter fat or milk may or may not represent the entire cost.

The cost of butter fat or of milk as determined by the usual method of keeping a dairy record is in a sense not the real farm cost. It is the cost where the food is charged to the cow at market price. And this market price may or may not be farm cost of the food. It always should be greater than the farm cost else the farm profits are not what they should be but in some cases at least the farm cost of hay or grain is greater than the market price and in these cases the determined cost of butter fat or milk by the record is less than the actual cost. If these foodstuffs were grown for less than the market price then the determined price as shown by the record would be greater than the farm cost.

Some years the cost of farm crops placed in silo or barn is more per ton than other years, and this affects the cost of the dairy products produced on the farm. Also the market price of some articles of feed, such as hay and oats, is many times below the cost of production, and to be fair to the cows these prices should be charged at market prices and not at what it costs the farmer to produce them.

The cost per unit of different dairy foods produced on the farm varies on different farms. One farmer may be a better farmer than his neighbor. He perhaps has a greater advantage in having a better farm. The land has been kept up in crop-producing power or was originally more fertile. He may have greater executive ability than the other. We find this everywhere in all kinds of business. Or one man has a greater working capital which enables him to do things on time and in the best way. It takes working capital to take advantage of farming opportunities just as well as it does to take advantage of other business opportunities.

Business men in other callings often criticize the farmer because he cannot tell the cost of farm products. Some say that if other business were run as slack so far as knowing the cost of production is concerned, it would go to the dogs and it probably would. The cost of production in farm products varies with almost every season. Men in other vocations who scold and find fault with the farmer because he does not keep accurate accounts and does not know the actual cost of production would find if they got actually up against the actual proposition that they would not know any more about the problem when they got through than the farmer does.

A BURIED TREASURE

One of the great drains through which the earnings of Nova Scotia farmers go out of the country is the purcahse of imported fertilizers. Probably the Province will never have an adequate supply within its own bounds of these materials, certainly not some of them. There is a possibility that the vast amount of fish scrap now wasted about our shores may some day become a valuable asset. However that may be, there is a huge resevoir of useful fertilizers underlying a large part of our farming area. Whole hills and ridges of limestone are scattered over the western end of the Province particularly.

The chief difficulty thus far in making use of this vast store is the lack of capital for its development. Behind this, of course, lies the fact that most people have not yet realized its value. As fertilizers go, ground limestone or even burnt lime, can be produced very cheaply, and with comparatively small outlay for plant

The results of the use of lime are not spectacular. One fair application will increase the yield of our average soils, say from 4 to 7 bushels per acre of ordinary grains per each year, over a period of 4 or 5 years, enough to make the difference on many farms between failure and success.

The experience of other agricultural countries emphasizes the value of lime. English farmers use it habitually and universally. The U. S. with a soil naturally containing a much higher percentage of lime than ours, placed it on the same basis as other necessities for production during the stress of war, and allowed only a ton per farmer, except by special permit, so that there might be enough to go around. The State of Illinois, one of the finest and most progressive agricultural areas in America, had one plant for grinding the limestone in 1912, and now has 57.

Here is an opportunity for a comparatively small capital investment to make available to farmers one of our great natural resources. Parties interested would do well to communicate with Prof. Harlow at the College of Agriculture, Truro.

ECHOES FROM THE NOVA SCOTIA DEPARTMENT OF AGRICULTURE

(Continued from page 203)

cotton seed, the Dept. of Agriculture, with characteristic decision, secured export license for this substitute. Farmers, Co-operative Associations and the trade generally have purchased some 1500 tons of this excellent feed and the Department is ready to secure further quantities if necessary. Linseed meal is particularly valued in Great Brtiain, Holland and Denmark and the armistice has already resulted in substantia lpurchases by these countries. Consequently this food has increased in price to Canadian buyers through the cessation of hostilities.

SEED WHEAT

Never in the history of Nova Scotia were there so many fine fields of wheat as in the past season, and never was the temptation so strong to grind it into flour, bran and shorts. Most of the N. S. wheat this year is of fine quality, having fortunately escaped the wet weather. The Department of Agriculture is advised that many farmers plans to mill all their wheat, saving none for seed. It is hoped that those who have first class wheat will save as much of it as possible to supply themselves and sell to their neighbours. The home grown seed, this year particularly, will be much preferable to that which can be imported. It cannot be too strongly urged, both from the patriotic and the business points of view, that a good share be saved for next spring's seed. Should there be a surplus then it can be turned into flour at a time when the shortage of imported flour will be more acute than at present.

SAVE YOUR SEED GRAINS

Last year Nova Scotia farmers had to import thousands of bushels of oats, wheat and barley for seed at very high prices. A repetition of this can be avoided next year if every farmer now will take account of his own and his neighbour's needs along this line and plan accordingly. Nova Scotia has had a record crop of grain, although some of it has been discolored by rain, yet its quality for seed has not been reduced. Indeed, it is far superior to the seed that will be available from other sources. Western Canada, which usually is the source of supply, suffered heavily by drought and frost. Past experience proves that grain grown under these conditions lacks vitality and will not give satisfactory results. The Secretary for Agriculture, who arranged for the importation of many cars of the best seed that could be got last spring, states that in general those who saved the home grown seed had the best returns. So from both points of view, of initial expense and of crop results, every farmer should do his best to provide himself with the home grown seed.

USE HOME GROWN SEED

The old scripture saying: "A prophet is not without honour save in his own country" is no longer applicable to seed grains. Experiments at the College in Truro, as well as the experience of hundreds of farmers, prove that home grown seed oats, wheat and barley, when properly selected, yield better crops than the imported grains. In the past, the very opposite impression has prevailed, largely because the imported seed was cleaned of foreign matter and small seeds, whereas the home grown was only to be had in its natural condition. Fortunately during the past five years, farmers have turned more and more to the home grown, acclimated article, and under the policy of the Dept. of Agriculture for the encouragement of fanning mills, a large number of these have come into the Province. These mills should be worked to capacity this winter in the preparation of clean, virile, home grown seed.

A GOLDEN AGE FOR SHEEP BREEDERS

It is reported by men of the N. S. Dept. of Agriculture, who travel about through the Province that farmers are saving their ewe lambs to a greater extent than ever before. This is important and encouraging news, and indicates one of the real gains which Nova Scotia is making through war conditions. This Province is not excelled by any in Canada for sheep raising, but the numbers kept are still far below its capacity and supply only the merest fraction of the demand for mutton and wool products. However, with the additional ewes this year and the infusion of so much good blood made possible by the action of the Local and Federal Depts. of Agriculture, the outlook for sheep breeding in N. S. is very bright.

FEED FOR DAIRY CATTLE

Apart from linseed meal, of which through private enterprise and the efforts of the Dept. of Agriculture, there is a considerable quantity on the marwet in Nova Scotia, the other feeds now obtainable fall into three groups: First—those with rather low protein content (say 10% to 16%) and with a comparatively high fibre content (say 8% to 18%). This class of feeds may be used to best advantage in feeding dairy cows. Second—those feeds which have rather more protein and less fibre. These are especially valuable hog feeds. Third—The feeds which are particularly high in protein as linseed and cottonseed meal. These may be used to add protein to the ration and stimulate the flow of milk.

There is a variety of these proprietary feeds to be had and the farmer is often puzzled as to which is the best to buy. In general these feeds which have about the same protein and fibre content are of about equal value for feeding purposes. For example: if you are offered a number of feeds varying from 10% to 12% in protein and from 8% to 10% in fibre there is probably little difference in their feeding value, and the one offered at the lowest price is the one to buy.

MAPLE SUGAR
CANE SUGAR
BEET SUGAR

wanted, but especially MAPLE SUGAR, for it grows on the spot, has not to be imported, takes no shipping space and is so valuable a food product these days that every maple grove owner should make nothing but the best syrup and sugar. Anything but the best is not doing your best for food production. Tap all your trees.

A Grimm Champion Outfit

ensures good syrup and sugar, and no waste. Put your maple bush in thorough working order and write us about a good outfit.

Oxford Junction, N. S.

Elmwood Stock Farm
OFFERS FOR SALE:

Two choice young Holstein Bulls, 15 and 18 months old, sired by Dutchland Pieterje Count, whose four nearest dams have records averaging 28.61 lbs. in 7 days, a grandson of Colantha Johanna Lad, "the world's greatest bull," 101 A.R.O. daughters, 4 over 32 lbs. and 7 over 30 lbs. Three of them world's records for 365 days.

W. L. ETTER, - Shubenacadie, N. S.

Clearing Sale of Shorthorn Cattle

Am offering for sale my herd of pure bred registered Shorthorn cattle. These cattle range in age from 7 years to 3 years, or a little less, with one bull calf two weeks old, and are all fine in type and color.

I have also exceptionally good grade cattle of various ages for sale. All will be sold at a reasonable price and offer an unusual opportunity to anyone desiring to start a herd of choice stock or to renew an old herd.

J. E. HETHERINGTON, - Codys, N. B.

GUERNSEY BULLS!

I offer for immediate sale, the Guernsey Bull, Lord Kitchener, No. 929, calved April 12, 1914. He is a fine type of the breed, and his sire and dam are of choice breeding. Will sell at a moderate price, as I am overstocked. I also have several younger ones for sale.

For particulars apply

C. G. COX. - Canard, Kings Co., N. S.
Successor to Wm. Cox & Son

FOR SALE !

One pair two year old Mammoth Bronze Turkeys, $8.00 (eight dollars.) One fine Guernsey Bull Calf, three months old. This animal is well grown, from a dam with a fine milking record.

SARAH E. MOSES SMITH,
WOODWARDS COVE, - - N. B.

FOR SALE
R. O. P. HOLSTEINS.

Two bulls ready for service, and several bull calves. The right type and prices right.

For description and price write,

Rothesay - - N. B.

Butter Parchment at Farmer Office

Lawndale Stock Farm
Jerseys and Shorthorns (Pure Bred)

JERSEYS:—

One registered Bull Calf, solid colour, (fawn) dropped in October, 1918. Out of a R. O. M. dam, by a "Golden Fern's Lad" sire.

Our latest importation consists of a young cow and yearling heifer, direct from the Island of Jersey.

SHORTHORNS:—

One registered Bull Calf, red, little white, dropped in March, 1918. He is large, in splendid condition, and out of a fine milking dam.

One or two heifer calves, red, little white, dropped in the summer of 1918, out of good milking dams; all three of the aforementioned calves are sired by the best son of "Stately Monarch", Champion in three Provincial Shows.

Our latest importation is a new Herd Bull, direct from the Milking Shorthorn herd of Lord Rothschild, Tring Park, England.

I. M. LOVITT, M.D.,
Yarmouth North, - Nova Scotia

Maple Green Farm Holsteins

Just now we are offering some fresh calved cows and some due to freshen shortly, also yearling heifers and heifer calves, all with official records or from official record dams. Remember this is the only herd in Eastern Canada which owns two Jr. 3 year olds with official records of 25.05 and 26.54 lbs. butter in 7 days.

Herd sires in service, "Maple Grove Mercena Mercedes," No. 11727, the sire of our 26.54 lb. Jr. 3 year old and who so far has not a tested daughter testing under 4%. Our Jr. herd sire, "Homestead Hengerweld Rooker," No. 20652, three-quarter brother to our 25.05 lb. Jr. 3 year old.

For particulars write

Phone 111. - - - - Sussex, N. B.

HIGHLAND LAKE HOLSTEINS

Herd sire, AVONDALE PONTIAC ECHO (under lease) a son of MAY ECHO SYLVIA, the world's record cow. Only one other 41-lb. bull in Canada.

We have young bulls for sale whose two nearest dams (both Canadian champions) average as high as 35.62 lbs. butter in seven days; another whose two nearest dams are both 100-lb. cows: and one ready for service from a 41-lb. sire and an 18,000-lb two-year-old dam. Send for our BOOK OF BULLS. A few females for sale. Satisfaction guaranteed.

R. W. E. BURNABY (Farm at Stop 55, Yonge St. Radial) JEFFERSON, ONT

BELLEVUE STOCK FARM
Shorthorn Cattle and Shropshire Sheep

The early maturing and good doing sort—bred from Show stock in every cross.

C. A. ARCHIBALD, Bellevue, Clifton, N. S.

NETHERLAND FARM, HAMMOND RIVER, N. B.

We are offering for sale calves of both sexes, sired by Dutchland Pieterje Count, a bull of splendid size and type, whose four nearest dams have records averaging 28.61 pounds of butter in seven days. His dam is a daughter of Colantha Johanna Lad, who has 101 A. R. O. daughters, 4 over 32 lbs., 7 over 30 lbs., three of them world's records for 365 days. If you want something choice, come and see these calves or write for further particulars.

We will also book orders for young Yorkshire pigs for next spring's delivery.

WM. S. HARDING, Prop.

ELMHURST SHORTHORN STOCK FARM

Present Offerings—Six exceptionally good red and roan bulls, 10 to 18 months of age, from superior milking dams. Write me for prices and particulars before placing your orders elsewhere

C. C. H. EATON, - - - CANARD, N. S.

COBEQUID FARM HOLSTEINS

We have sold 13 head in the last few weeks but there are some dandy good ones left yet. Special offering—2 heifer calves and several bull calves, sired by Prince Colantha's Canary B. whose four nearest dams average 32.84 lbs. butter in 7 days; 105 lbs. milk in one day. These are beauties. A couple of yearlings and two-year-old heifers, bred to Prince, due in the fall. Several young cows and heifers milking, due to calve from August to December. We have a couple of bull calves fit to head the best herds in the provinces. Come and see them. We would be pleased to meet you at Truro if notified.

S. DICKIE & SONS, R. R. No. 5, TRURO, N. S.

BULL'S CREEK FARM
R. O. M. HOLSTEINS

EXTRA SPECIAL—I recently imported several Tuberculin Tested R. O. M. daughters of "Sir Lyons Segis" whose six nearest dams average over 30 lbs. butter each in seven days. These cows have in turn been bred to "Riverdale Lyons Echo Posch" whose dam, grand-dam and great grand-dam and dam's sister average officially 34 lbs. butter each in seven days. Am offering young bull calves of this remarkable combination of breeding and will sell a heifer calf or two. Get your orders in quick, they won't be here long.

J. H. STOCKTON, BULL'S CREEK FARM, WOODSTOCK, N. B.

WISH-TON-WISH STOCK FARM
Breeders of Big, Smooth, Heavy Producing Holsteins

The kind that fill big pails the year through. Can sell a few good bulls fit for service and some choice Bull Calves; also some Heifers and Cows due to freshen soon. Write or 'phone for description and prices.

HARDING BROS., Proprietors, WELSFORD, New Brunswick.

Registered Jersey Heifer

We offer for sale the registered Jersey Heifer, "Pride of Rose Bank," 3 years old, milking sired by Foxhall's St. John O'Dreamwold, whose dam gave over 10,000 lbs. milk in a year. Also Peerless Incubator, Barred Rock and White Leghorn Cocks and Cockerels, which would exchange for Barred Rock Hens.

ORCHARD HILL FARM

Feeding Cattle in Nova Scotia

By Prof. John M. Trueman, N.S.C.A. Truro, N. S.

The food requirements of cattle may be placed in two divisions; first, the amount needed to maintain the animal, anad second, the amount used to produce growth, fat, milk, or work. The amount needed to keep the animal body in proper condition without laying on fat or producing growth, or giving milk or doing work is called the maintenance requirement, and uses up from one-half to two-thirds of all the food the animal is able to eat. By fixing in our minds the fact that animals must use a relatively large amount of food to maintain life we are strongly impresed with the necessity of giving them extra food in order that the products useful to man may be obtained.

In studying feeds we divide their chemical compounds into two main classes. First, crude protein, which is the part of the food which the animal uses to produce red muscle, and to build up the body. All of our farm feeds contain these protein compounds. They are found in the form of gluten in wheat and corn, and are contained in large quantities in the seeds of flax and cotton. The richest protein seed grown in Nova Sdotia is the field pea. The leguminous fodders such as clover hay and peas and vetches are quite rich in protein and for that reason are especially valuable as farm feeds.

The second class of food stuffs includes those chemical compounds especially valuable for the production of heat, fat and work. They are called the carbchydrates and fats, and are represented by fibre, starch and sugar, and by the oils or fats found mostly in seeds. In making up a ration for farm animals it is necessary to arrange for the right proportion of protein and carbohydrates.

The requirements of a ration are stated as so many pounds of digestible protein and so many pounds of total digestible nutrients, the latter term including the protein as well as the carbohydrate sand fat. In the table at the end of this article the column headed total digestible nutrients is made up in this way.

Numerous experiments have shown the average amount of digestible protein and total digestible nutrients required to mainta a cow of any given weight, and also how much is necessary to produce a pound of milk. The standards given below are those in use at the Nova Scotia Agricultural College and are practically the same as those given in the 1915 edition of Feeds and Feeding by Henry & Morrison.

Feeding standard for dairy cows:—

	Digestible Crude Protein lbs.	Total Digestible Nutrients lbs.
For maintenance for each 100 lbs. of live weight	0.07	0.7925
To the allowance for maintenance add:		
For each pound of 3.5% milk	0.061	0.319
" " " 4.0% "	0.065	0.350
" " " 4.5% "	0.069	0.379
" " " 5.0% "	0.073	0.405
" " " 5.5% "	0.077	0.431

If the cow weighs 1000 lbs. multiply the maintenance standard for 100 lbs. by 10. If the animal weighs 1200 lbs. multiply by 12 and so on.

By this standard a cow weighing 1000 lbs. would require 0.7 lbs. of digestible urotein and 7,925 lbs. of total digestible nutrients for maintenance. If she were giving 30 lbs. of 4½ milk per day she would require in addition to the allowance for maintenance 1.95 (30 times .065) pounds of digestible portein and 10.50 (30 times .350) pounds of total digestible nutrients. Adding these to the requirements for maintenance we get a total requirement of 2.65 pounds of digestible protein and 18.42 pounds of total digestible nutrients for one day for a cow weighing 1000 lbs. and giving 30 lbs. of milk.

	Digestible Protein	Total Digestible Nutrients
For maintenance 1000 lbs. cow	0.7	7.925
For 30 lbs. of 4% milk	1.95	10.50
Total requirement	2.65	18.425

The following ration would supply this amount of nutriment:—

RATION NO. 1	Digestible Protein lbs.	Total Digestible Nutrients lbs.
18 lbs. Mixed Hay	0.846	8.55
50 " Turnips	0.500	4.70
2 " Wheat Bran	0.250	1.22
2 " Wheat Middlings	0.268	1.39
1 " Crushed Oats	0.097	0.81
2 " Cotton Seed Meal	0.740	1.56
	2.70	18.13

If the cow weighed 1000 lbs. and was giving 25 lbs. of 4½ milk daily the requirement would be 2.32 lbs. of digestible protein and 16.67 lbs. of total digestibel nutrients. This amount would be supplied in the following rations.

Ration No. 2

Mixed Hay	15 lbs.
O. P. V. silage	30 lbs.
Wheat Bran	2½ lbs.
Wheat Middlings	2 lbs.
Crushed Oats	2 lbs.

Ration No. 3

Mixed Hay	20 lbs.
Wheat Bran	3 lbs.
Middlings	4 lbs.
Crushed Oats	2 lbs.
Cotton Seed Meal	½ lb.

For heavier milking cows the concentrate of grain part of the ration should be increased, but they will not eat any more hay than the amount given in the previous rations. Scottie's White Floss, an Ayrshire cow in the College herd that produced over 12000 lbs. of milk in 1916 did her best work on the following ration which contains a very small amount of hay, but an additional 16 lbs. of roughage in the O.P.V. silage.

Ration No. 4

Hay	8 lbs.
Silage O. P. V.	16 lbs.
Turnips	60 lbs.
Bran	5.5 lbs.
Middlings	3.0 lbs.
Cotton Seed Meal	1.5 lbs.

This cow was fed 18 lbs. of grain daily for a few weeks, which is six pounds more than the amount given above, but this extra amount of grain protein produced no increase in milk flow, although it probably kept the cow in better condition and enabled her to kee up her milk production longer in the spring.

Two of the large Holstein cows at the College produced 70 lbs. of milk per day on the following ration:—

Ration No. 5

Hay	14 lbs.
Roots	72 lbs.
Bran	8 lbs.
Gluten	6 lbs.
Banner Feed	5 lbs.
Oil Meal	2 lbs.

These cows weigh 1300 lbs. or more each, and although they ate a small amount of hay they ate 21 lbs. of grain mixture. Both cows gave over 80 lbs. per day for some time and never had more than 21 lbs. of grain per day.

Rations No. 6 and 8 are given as samples of what may be fed when grain is high or difficult to get; although not as good as for producing milk as a heavier grain ration they will give fairly good results with most cows. They are figured for a 1000 lb. cow, giving 25 lbs. of milk.

Ration No. 6

Mixed Hay	18 lbs.
Turnips	50 lbs.
Crushed Oats	4 lbs.
Wheat Bran	4 lbs.

Ration No. 7

Mixed Hay	18 lbs.
Turnips	50 lbs.
Bran	4 lbs.
Middlings	3 lbs.

Ration No. 8

Hay	15 lbs.
O. P. V. Silage	30 lbs.
Wheat Bran	3 lbs.
Turnips	15 lbs.
Cotton Seed Meal	1 lb.

Ration No. 9

Mixed Hay	15 lbs.
Corn Silage	30 lbs.
Wheat Bran	3 lbs.
Middlings	2 lbs.
Oil Meal	1 lb.
Cotton Seed Meal	1 lb.

Ration No. 9 uses corn silage which is lower in protein than O.P.V., and consequently more high protein grain is needed to balanace it properly. It is an excellent ration, however, and can be used whenever corn can be grown succecssfully.

Ration No. 10

Mixed Hay	20 lbs.
Turnips	30 lbs.
Any feed in the bran group	3 lbs.
Linseed Meal	3 lbs.

Ration No. 11

Mixed Hay	12 lbs.
O.P.V. Silage	30 lbs.
Any feed in the bran group	3 lbs.
Oil Meal	3 lbs.

Ration No. 12

Mixed Hay	10 lbs.
O.P.V. Silage	30 lbs.
Any feed in the bran group	3 lbs.
Linseed meal	1 lb.

Ration No. 13

Mixed Hay	20 lbs.
Any bran group feed	5 lbs.

Ration No. 14

Mixed Hay	10 lbs.
O.P.V. Silage	30 lbs.
Turnips	25 lbs.

Ration No. 13

Any feed of the Middlings group	4 lbs.
Linseed Meal	1 lb.

Ration No. 14

Ground Oats	3 lbs.
Shorts	3 lbs.

A study of rations, Nos. 1 to 9, will show that the feeds used in them are practically all straight farm feeds without any mixing. This class of feeds can be sold by the dealers without being registered or the analysis given on the bag. Linseed meal and Cotton Seed meal are not included in the free list but must be sold under a guarantee of their composition. In addition to those two there are on the market a long list of mixed, or proprietary feeds that are made up of a numbe rof by-products of various mills which must be sold under a registration number.

(To be continued)

6th Annual Convention of Dairymen's Association of Nova Scotia, College of Agricultuue, Truro, Jan. 8 & 9

The Sixth Annual Convention of the Nova Scotia Dairymen's Association and Creamery Butter Exhibition was held at the Agricultural College, Truro on Thursday and Friday, Jan. 9th and 10th. and was the most successful in the organization's history.

The officers of the Association for 1918 were:—

President—A. M. Wheaton, Wolfville, N. S.

Vice President—Harold Falconer, Stellarton, N. S.

Secretary-Treasurer—W. A. McKay, Truro, N. S. (N. S. A. C.)

Directors—President, Vice-President and J. D. McKenzie, Bridgewater, N. S., H. M. Aitken, River Hebert, N. S., J. C. Chisholm, South River Station, N. S.

The opening session, held in the College of Agriculture on Thursday, Jan. 9th, was attended by delegates from all the principal Creameries in the Province, and a number of visitors, representatives of different business firms, etc.

The President, A. M. Wheaton, of Wolfville, was in the chair and after a few appropriate, introductory remarks by Prof. Cumming, gave the President's address for the year.

This was followed by the report of dairying by W. A. MacKay.

The output of the Creameries showed a small increase over 1917 and a total turn over of $943,000,00.

Prof. Trueman delivered an address on Feeding the Dairy Cow.

Mr. H. R. Brown gave a report on cow testing, illustrated by chart, showing that where records were kept the production, per cow, increased from 20 per cent to 80 per cent as compared to where records were not kept.

Mr. H. W. Coleman, Dairy Superintendent for New Brunswick, gave the report of the judges, followed by presentation of special prizes by Mr. Harvey Mitchell.

A complete report of the prize list follows:

DAIRYMEN'S ASSOCIATION OF NOVA SCOTIA

Summer Butter Competition 1918.

Name	Address	Official Score	Award
Pictou Co. Dairy	Stellarton	91.10	1st.
LaSociete Industrie Laitiere	Meteghan	90.96	2nd.
Intercolonial Creamery Co.	South River Station	90.78	3rd.
Scotsburn Creamery Co.	Scotsburn	90.50	4th.
LaHave Creamery Co.	Bridgewater	90.45	5th.
South River Creamery Co.	Lock Katrine	89.97	6th.
Brookfield Creamery Co.	Brookfield	89.94	7th.
Cumberland Co-operative Creamery	River Hebert	89.62	8th.
Milburn Creamery Co.	Malignant Cove	89.56	9th.
Margaree Creamery	Margaree Forks	89.40	10th.
Acadia Dairy Co.	Wolfville	89.26	11th.
Baddeck Creamery	Baddeck	89.14	12th.
Antigonish Dairy Co.	Antigonish	88.88	13th.
Crystal Spring Creamery Co.	Little Bass River	88.58	14th.
Bay View Creamery Co.	Selma	88.22	15th.

Special Prizes in Summer Butter Competition.

Smith and Proctor Prizes, Halifax, N. S.

Cash $60.00 Duplicate Association Prizes.

Fitted Club Bag

To Creamery Manager having the most representative increase in butter made during the year.

Won by W. L. Brenton, Brookfield.

Club Bag

To the butter maker having the most uniform score during the season.

Won by J. D. McKenzie, Bridgewater.

De Laval Company Limited, Peterboro, Ont.

To the Creamery having the highest average score during season.

1st. An Alpha Testing Outfit.

Won by Pictou Co. Dairy Co., Ltd.

2nd. An Alpha Moisture Test.

Won by Intercolonial Creamery Co.

R. B. Colwell Prizes, Halifax, N. S.

Five Prizes of $10.00 each to the highest monthly score.

June:
Brookfield Creamery.

July:
Pictou Co. Dairy Co., Limited.

August:
La Societe d'Industrie Laitiere Ltd.

September:
La Societe d'Industrie Laitiere Ltd.

October:
Antigonish Dairy Co. Limited.

Winter Dairy Exhibition.

Section 1—28 lb. Box New Made Butter.

Award	Name	Address	Score.
1st.	LaHave Creamery Co., Ltd	Bridgewater	95.6
2nd.	Scotsburn Creamery Co., Ltd	Scotsburn	95.0
3rd.	Brookfield Creamery Co., Ltd	Brookfield	94.8
4th.	Antigonish Dairy Co., Ltd	Antigonish	94.0
5th.	Acadia Dairy Co., Ltd	Wolfville	93.5
6th.	Baddeck Creamery (Won on Flavor)	Baddeck	93.3
7th.	Intercolonial Creamery Co.,	South River	93.3
8th.	Bayview Creamery Co., Ltd.	Sterling Brook	92.6

Section 2—30 lb. Box in Prints.

1st.	Scotsburn Co., Ltd	Scotsburn	95.7
2nd.	Antigonish Dairy Co., Ltd	Antigonish	95.1
3rd.	Brookfield Creamery	Brookfield	94.4
4th.	Acadia Dairy Co., Ltd	Wolfville	93.7
5th.	LaHave Creamery Co., Ltd	Bridgewater	93.2
6th.	Intercolonial Creamery Co., Ltd	South River Station	92.9
7th.	Bayview Creamery Co., Ltd	Sterling Brook	92.3
8th.	Pictou Co. Dairy Co., Ltr	Stellarton	92.1

SPECIALS.

By the Canadian Salt Co., Ltd. Windsor, Ont.

To the highest scoring Butter in Section 1 or 2

1st. Scotsburn Creamery Co., Ltd $12.00
2nd. LaHave Creamery Co., Ltd 10.00
3rd. Antigonish Dairy Co., Ltd 8.00

The above Salt Co., also donated badges for the members of the Association.

By C. Richardson and Co., St. Mary's, Ont.

To the Highest Scoring Butter in Section 1 or 2

1st, Scotsburn Creamery Co., Ltd—Sterling Silver and Mahogany shield.
2nd. LaHave Creamery Co., Ltd—Sterling Silver and Mahogany Shield.

By J. B. Ford Co., Ltd. Wyandotte, Mich.

To the Buttermaker making the highest total score in Secion 1 or 2.

1st. A Size 12 Elgin Movement 15 Jewel watch, 20 year gold filled case.
Won by Scotsburn Creamery Co., Ltd.

2nd. Cartridge Premo Roll film Camera, single Archromatic lens, reversible finder fovesing scale.
Won by Brookfield Creamery.

BUTTER BUYER'S TROPHY.

Donated by Smith & Proctor, R. B. Colwell and Nickerson & Co., Halifax and Smith and Proctor Ltd., and The Harris Abattoir Co., Ltd. Sydney.

To become the Property of the exhibitor of the highest scoring butter at the Exhibition it must be won three times before becoming his absolute property.

Won by Scotsburn Creamery Co., Ltd. in Section 2.
Previous Winner—1916—Brookfield Creamery
1917—LaHave Creamery Co., Ltd.
1918—Siotsburn Creamery Co., Ltd.

Friday forenoon was devoted to a Scoring Competition, the winners and scores being:

1. John E. Falt, Antigonish.....96.4
2. Alex. Cameron, Lr. South River 93.9
3. D. E. McLeod, Baddeck.....92.8
4. W. L. Brenton, Brookfield....92.3
5. J. D. McKenzie, Bridgewater..91.5

This was followed by a general discussion on the quality of butter, dealing particularly with the new grade standards, and emphasizing the fact that all the butter at the convention of which the cream had been pasteurized had scored th highest and showed the best keeping qualities.

Friday afternoon was the business session, Reports of committees, Officers, etc.

The officers elected for 1919 are as follows:

President—H. Falconer, Stellarton.

Vice-President—J. D. McKenzie, Bridgewater.

Directors—President, Vice-President and J. C. Chisholm, Lower South River, W. L. Brenton, Brookfield and Robert T. Stewart.

Members of the National Dairy Council, Harold Falconer, Stellarton, and D. W. Murray, Scotsburn. Sec'y. Treas. W. A. McKay, Truro.

The following resolutions were considered and after full discussion were adopted:

No 1.—Moved by Harold Falconer, Seconded by D. W. Murray.

Whereas, at the Dairy Conference held in Ottawa Nov. 25-28 last, it was thought by the representatives present it would be to the best interests of th Dairy Industry to form a National Dairy Council and whereas,

After due discussion and consideration the National Dairy Council of Canada was formed and whereas.

That some method of having some immediate financing for the Dairy Council, it was duly passed that each provincial representative pledge himself that his province would pay to the National Dairy Council the sum of One Hundred Dollars and whereas.

Each Province had two representatives, this Provincial Association is pledged to pay to the National Dairy Council the sum of Two Hundred Dollars.

Therfore be it resolved that this Dairymen's Association of Nova Scotia do authorize the treasurer to pay to the National Dairy Council the sum of Two Hundred Dollars, the same to be paid before Feb. 1st, 1919, and the method employed for raising the funds for this amount be a tax levied on each creamery proportioned according to the amount of business done by each creamery during the year 1918.

Adopted.

No. 2.—Moved by John E. Falt, Seconded by J. D. McKenzie.

Whereas, the system of cream grading when followed by creameries has resulted in a marked improvement in the quality of the cream received and in the butter manufactured therefrom, and

Whereas, this improvement has not been noticeable where a premium was not paid for No. 1 cream.

Therefore, be it resolved that this Association recommends to the Creameries of the Province of Nova Scotia the advisability of cream grading to conform to the grade standards as advised by the National Dairy Council, coupled with the payment of

a difference of at least two cents per pound fat between grades.

Adopted.

No. 3.—Moved by Robert T. Stewart, Seconded by John E. Falt.

Whereas, the world war is about to be terminated successfully to the Dominion of Canada and

Whereas, That from now on will come a period of readjustment of the Agricultural Industries in Canada, and

Whereas, it is generally agreed by agricultural experts that the larger part of the agricultural portions of Nova Scotia is better suited to Dairying than any other branch of agriculture, and

Whereas, to bring about the necessary changes in the condition of the country to make the citizens of Nova Scotia realize the opportunities that lie before them in Dairy Work, a very progressive and effective means of education will have to be effected, and

Whereas, a beginning has been made along this line through the medium of the so called Maritime Dairy School which has been in existence in connection with the College of Agriculture at Truro for two years and was supported financially and otherwise by the three Maritime Provinces, and

Whereas, the present buildings, plant and equipment are not large enough for the development of the school,

Be it resolved that the Dairymen's Association in Annual Convention assembled, place its appreciation on record for the good work that has been done in the past in getting the Dairy Interests of the Maritime Provinces centred togethr in the Maritime Dairy School.

That it is convinced that better and more efficient work can be done through the medium of one school of sufficient size and capacity than more.

That a school of this class should be purely Maritime, that is, owned and operated co-operatively by the three Maritime Provinces.

That just as soon as possible a school of sufficient size and with proper equipment to best accomplish these purposes be established.

That a committee of three are appointed from this Association to present this resolution to other interested associations and also to the proper Government Officials in the different provinces.

Adopted.

No. 4.—Moved by J. D. McKenzie, Seconded by Harold Falconer.

Whereas, that from information that we have received from the results of the Summer Butter Competition, be it therefore resolved that this Association carry on this Competition again during the season of 1919, and we would also recommend that we impress upon our Creamery Managers the importance of having a butter that will conform to the new grade standards as recommended by the Dominion Dairy Conference at Ottawa, Nov. 1918.

Adopted.

No. 5.—Moved by Robert Stewart, Seconded by John C. Chisholm.

That the use of inferior bulls by the farmers of Nova Scotia is in a large measure responsible for lack of increased production by the dairy cows of the Province is recognized by everyone. Being sure that a more general practice of cow testing would mean the elimination of many of these inferior animals:

Therefore be it resolved that this Association request the Provincial Department of Agriculture through the Superintendent of Agricultural Societies, the District Representatives and other officers of the Department to make greater efforts to increase the practice of cow-testing.

Adopted.

No. 6.—Moved by Alex. Cameron, Seconded by W. L. Brenton.

Believing that to the creameries and cheese factories of Nova Scotia increased production per cow and per patron is of greater importance than an increased number of patrons, or in fact than any other factor in the development of dairying in Nova Scotia,

And believing also in view of the results obtained in all parts of the Province that cow testing and the keeping of dairy records is the one and only method of bringing about that increase,

Therefore be it resolved—that this Association strongly state its conviction that the management of every creamery and cheese factory in the Province should take some definite action to extend the work of cow testing among their patrons.

Adopted.

No. 7.—Moved by J. D. McKenzie, Seconded by D. W. Murray.

Considering the large increase in the production of milk and butter fat by patrons of various creameries and cheese factories in Nova Scotia, who have been carrying on the work of cow testing for some time, and believing that persistent efforts will finally make the practice much more general,

Therefore be it resolved—that this Association express their sense of gratitude to the Dairy Division of the Dominion Department of Agriculture for the manner in which this work has been conducted in the past, and that we also request that no effort be spared to extend the work in the future.

Adopted.

No. 8.—Moved by H. A. MacDonald, Seconded by D. E. McLeod.

Whereas, at the meetings of this Association last evening and this morning, it was showed us the amount of very effective work which was done by the Judges in placing the awards,

Therefore, be it resolvd, that we express our appreciation of the work in connection with the present exhibition, and also their work in the past, to the Judges, Mr. Harvey Mitchell, Mr. D. J. Cameron and Mr. H. Coleman.

Adopted.

No. 9.—Moved by J. D. McKenzie, Seconded by Robert Stewart.

Whereas, in the years past the following have contributed so liberally to the success of the exhibitions which have been held in connection with this Convention,

Therefore, be it resolved that the thanks of the Dairymen's Association be forwarded to The Canadian Salt Co. Ltd., The DeLaval Company, Ltd., The J. B. Ford Co., C. Richardson & Co. and also the butter buyers, Messrs. Smith & Proctor, R. B. Colwell, Nickerson & Co. of Halifax and Messrs. Smith & Proctor and The Harris Abattoir Co., Sydney.

Adopted.

No. 10.—Moved by R. B. McLennan, Seconded by W. L. Brenton.

In years past the Dairy business of Nova Scotia had in the person of Mr. George Vinten a strong supporter and advocate, but for some years ill health has kept him from our councils,

Therefore, be it resolved that we extend the sympathy of this Association to Mr. Vinten on his inability to be with us and that a copy of this resolution be forwarded to Mr. Vinten.

Adopted.

The keynote of the whole convention this year was that if Dairying is going to be made the success in Nova Scotia that the circumstances and possibilities warrant; that all connected with it have got to get down to business much harder in the future than in the past.

BACK TO ORDINARY OPERATIONS

The Smith Foundry. Fredericton. one of the firms whose efforts along with those of other Canadian shell makers. have helped to attain a splendid final victory for Britain and her Allies, are annuouncing that munition work having closed, they are able to resume their ordinary operations. Look up their ads. in the columns of the Maritime Farmer, where they have been consistent advertisers for a number of years, of their general foundry and machine shop products.

AN AWFUL MILITARY APPOINTMENT

The appointment of Col. W. E. Thompson, as officer commanding the Sixth (Halifax) Military district has been announced. Col. Thompson has been basking in the comforts of Halifax for four long years. He has a partner, Lieut. Col. Adams, who has been risking his life for almost the same length of time in the same city. Both were majors in the militia when the war started. Neither has seen active service. Yet one has been placed in command of the most strongly fortified British possession in America. And this selection was made in the face of Canada's promise that it was the men who fought Canada's battles were to be preferred to the stay-at-homes.

If Col. Thompson had been selected for any other post than that of O. C. of the front door of Canada, one would not think so much of it. But every man who returns from the front, whether he be a winner of the Victoria Cross, Military Cross, Military Medal, or other distinguished honor, or for that matter the entire lot, will be compelled to SALUTE Col. Thompson, should be happen to be at the landing place, DISCHARGING HIS ONEROUS MILITARY DUTIES.

It has been the proud boast of Canadians at the front, that in two years they never lost a gun, never relinquished a foot of ground they had consolidated, and never failed to take a position they were sent forward to attack. And their reward when they reach Canada, should the landing be at Halifax, will be to salute an officer, who by no possible stretch of imagination, is entitled to the post he occupys.

Thousands of young men left the farms of the Maritime Provinces voluntarily. Hundreds of these brave lads are buried in France or Flanders. Their comrades who survive will return to find, not one of their fellows, but a man whose military record has been ridiculed pretty extensively, in command at Halifax. Well might that magnificent Canadian McRae express himself:

"Take up the quarrel with the foe,
To you with falling hands
We throw the torch; be yours to hold
it high.
If ye break faith with those who die
We shall not sleep, though poppies
bloom
In Flanders fields."

Had he in mind. when he penned these wonderful lines, which will endure forever, such things as the appointment of this man Thompson to the position which he presently occupies. Is this to be the reward of men who have bled and suffered, and whose hells in the last few years have been measured by their service? Are they to be ignored while our home clinging soldiers are given the highest positions in the gift of the Canadian military authorities? If farm organizations wish to resolute, here is a fitting subject for every farm organization in Canada. Send them to General Mewburn, the Minister of Militia, Ottawa. If he doesn't realize how public opinion looks upon this thing; then let the fathers of fighting Canadians enlighten him.

THE PASSING OF CARL STEEVES

A few sort weeks ago we visited the farm of J. Carl Steeves, of Petitcodiac, where the Government Clover Huller was in operation. Seven hundred pounds of good clover seed had been threshed on this farm this fall and the huller was still busy. He talked of plans for the future and was enthusiastice over the prospects of sowing clover seed with a lavish hand in the spring of 1919. This progressive young farmer was just the type of young man that one delights to meet and whose cheerfulness makes one better because you had met him. He will not sow clover seed in 1919. Divine eProvidence had other plans in store for him and called him to the great beyond on the third inst. He succumbed to an attack of the dreaded "flu" at the early age of twenty-six years, leaving a bride of only a few months and a mother and sister to mourn their loss. We extend our sincerest sympathy. His passing is a loss to the province. ,

Maritime Farmer's Automobile Department

Subscribers will have an opportunity of getting many supplies at reasonable prices. Tires for small cars.

The Maritime Farmer has arranged for an automobile supply depot for its subscribers. The Maritime Farmer will run regularly an automobile information department. It will be illustrated and in it will be given in each issue valuable hints for the upkeep and operation of your car. An expert will be in charge of this section of the paper. If you are having troubles with your cars, write us, when the service starts, and if you are a subscriber, we will ask our expert to unravel your tangle. Any car owner will find information in this section which may save him many times the price of the subscription to the Maritime Farmer. If there is a car owner who does not get up against it good and hard at some stage of the game, he is a rare bird and is to be envied. The auto expert will be paid by us to help you, and we believe he will be able to do so.

In regard to supplies, we will be able to furnish you a tire for small cars, Maxwells, Fords, Gray Dorts, Chevrolets, etc., in plain and non-skids. These tires have a guarantee behind them of 3,500 miles. They are made by a reliable company. The prices will be f.o.b. St. Jorn or Sussex, non-skids $19.00; plain tires $16.25. We offer spark plugs at 90c., 95c. and $1.00. They can be supplied for any make of car. They sell in the open market at $1.25, $1.35 and $1.50. These prices are cash with order. REMEMBER WE ARE NOT GENERAL DEALERS. WE ONLY SELL AT THESE PRICES TO BONAFIDE SUBSCRIBERS OF THE MARITIME FARMER.

We have a number of other lines which will interest you and would appreciate a line from you. Later we expect to have all sizes of tires. Last season we contracted for our supply but were cut out because we declined to sell at the high price fixed for us by the manufacturer. We wanted tires for MARITIME FARMBR SUBSCRIBERS and WE PROPOSE TO GET THEM.

Tell your friends about it. If they own cars, get them to subscribe to the Maritime Farmer. We will save them a good many dollars in the years to come.

THE MARITIME FARMER

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the people of the Maritime Provinces.

Official Organ of The Farmer and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The Maritime Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

DATES OF ISSUE.

March 4-18

JANUARY 21, 1919.

CORNER STONES OF SUCCESSFUL AGRICULTURE

Live stock raising, be it cattle, sheep, or swine, is a safe line of agriculture for any farmer in Maritime Canada. Taken as a whole and comparing one year's records with another, the sections where live stock play an important part in the farmer's programme have fewer off years and there are also fewer mortgages recorded against the farms.

To grow live stock successfully, however, it is necessary that an abundance of feed be produced at home. The less feed the farmer needs to purchase the better it will be for his bank account. Roots, clover and grains can be grown in abundance in all sections of the Maritime Provinces, and there is absolutely no need of the great inroads purchased feeds make upon our resources.

There are several prominent factors that our live stock breeders should not fail to consider, viz. drainage, liming, good cultivation and good seed, and to our way of thinking the order of their importance is the order in which they are herein named. It is a waste of time, energy and money to farm wet soil. A farmer may not be so situated in regard to finances and labor that he can afford to do any great amount of this class of work in one year. This is, however, a line of work that he cannot afford to go undone. No one can afford to farm wet soil, because he cannot get the utmost returns for time and money expended from a soil in which the plant's feet are so to speak, constantly in the water. We know how busy a man the farmer is. We have been through the mill and know whereof we speak, and we know that if he plans to do a little drainage work each year, he will eventually reach the goal. The added revenue from the ditched areas will as years go by assist very materially to accomplish the work on the remainder of the farm. Get the main waterway arranged first, and go at the work in a systematic way by following a well defined plan. If a plan of this kind is followed there is always a place where one can spend an hour or perhaps a few hours at a time ditching between busy seasons and from time to time during busy seasons, whenever the opportunity offers, and it is surprising how much will be accomplished throughout the esason in this way, during periods of time that perhaps would otherwise be used to less advantage. Show us a farmer who follows this plan and we will show you a farmer who will be steadily cilmbing the ladder of independence.

Next to drainage comes the question of liming to sweeten the soil and make it in every way more congenial for plant growth. There are thousands, yes, millions of tons of lime stone in the Maritime Provinces. Arrangements can be made to procure some ground lime stone at reasonable cost in almost any section, providing the farmers of the respective districts wish to procure this valuable product at rock bottom prices.

We heard a farmer a few weeks ago say that three years ago he had used ground lime stone at the rate of two tons per acre on a field from which he had never been able to get a satisfactory hay crop. The application of the ground limestone has wrought a change and even without the use of manure or fertilizer he has succeeded to cut two bumper crops of hay off the limed area. There are hundreds of instances of this kind. Soil overlaying lime stone rock has been found to be benefited by the application of ground lime stone.

Ground limestone is produced in a commercial way by several advertisers in the columns of The Maritime Farmer and then there is the Government Lime Stone crushers that groups of farmrs may get to do work for them at a nominal cost per ton.

Now that the soil is drained and limed the next step is good cultivation. Every extra harrowing makes the soil particles finer and the plant food therein contained more available. If, while the process of cultivation is going on, one can incorporate either staple manure, comport or commercial fertilizers with the soil where required, so much the better for the crop, and in many cases a small outlay for plant food of this kind gives a handsome dividend on the outlay at harvest time.

The fourth and last point in good farming systems which we wish to emphasize at this season, is the use of good seed. The best is none too good. It makes no difference how much preparation may be given the other factors of ones farming practice unless good seed is used the results will be disappointing. The farmer who builds his farming fabric on the four corner stones of drainage, lime, thorough cultivation and good seed will always have an abundance of feed for his live stock, and on a foundation of this kind will surely raise a structure of which any farmer and community may look with pride.

THE IMPORTANCE OF SAVING GOOD BREEDING STOCK

During the past four years, millions of men who had previously been producers of the largest part of the food stuffs required in Europe, have been engaged in fighting for their country, and, as a result, thousands of farms, flocks and herds have been depleted and the finest lands made unfit for cultivation. These European countries are looking to Canada for good breeding stock to restock their abandoned farms. The demand is unlimited and European markets will be able to receive double our present production, if we can produce stock of the quality required.

It is the sires of high quality which have made many a herd great and have done so much good to the live stock industry of Canada. Often the highest priced stock is the cheapest in the end.

A pur-bred sire of good type and individuality is the one that should be used by every live stock breeder in the country. The sire whose ancestors have not made good, or that is a poor individual, will likely turn out to be a liability rather than an asset. His use will never improve live stock even if one does get him cheaply. He is dear at any price. It is also very important that the females usd as a foundation, are good, strong, healthy animals of robust constitution representing the best type of the breeds which you are working with, and that they are descendants from ancestors that have proved worthy of the breed they represent in regard to conformation, quality and production.

This year above all others, with the high price of hay and live stock, farmers should endeavour to utilize to the best advantage possible, all roughages such as straw, corn stalks, etc., by running these through a cutting box and mixing with a small amount of cut hay, with the addition of a few pulped roots and a small quantity of meal, you will have a food which breeding stock will thrive and winter very well on, and at the same time enabling the farmer to keep his usual quota of breeding animals.

A good many farmers are in the vicinity of lumber mills or finishing mills where they are able to procure sawdust or shavings for bedding in the place of straw, or where they could use dry muck for an absorbent. By utilizing all the home grown roughages and keeping more live stock, the farmer will be increasing the fertility of his farm by a method which has been proven most conclusively the best and most economical way of maintaining agricultural production, never more essential than at the present time.

FEEDING CATTLE IN NOVA SCOTIA

In this issue of The Maritime Farmer will be found an article on "Feeding Cattle in Nova Scotia" by Prof. J. M. Trueman of the N. S. A. C., Truro, N. S. This timely article is from a bulletin recently issued by the Nova Scotia Department of Agriculture. The subject under discussion is also applicable to conditions in New Brunswick and Prince Edward Island, and should be read with interest by all farmers who have cattle to feed.

Prof. Trueman needs no introduction to the readers of The Maritime Farmer, suffice to say that as a practical agriculturist, he enjoys an international reputation. His addresses to farmers are always brim full of just the kind of information that helps. The feeding of cattle is a live question at the present time. Save this issue of The Maritime Farmer for future reference, you will get the value of your year's subscription out of the article in question.

Hairless Pigs---The Cause and Remedy

(E. B. Hart and H. Steenbock, Wisconsin)

(E. B. Hart and H. Steenbock, Wiscon

Every spring on the farms of Wisconsin as well as in other section of the "hog belt" there are born a considerable number of hairless pigs. Practically every county where swine raising is developed and from which we have had reports has had cases of this malady. It occurs in the northern as well as in the southern counties, and in the western as well as in the eastern part of the state.

In some other sections of our country, notably from Montana, the losses from hairless pigs have been enorous. It is estimated that from 100,000 to 1,000,000 are lost annually in that state alone from this cause, and it has become a serious menace to the swine industry in several states and to some of the swine breeders in our own state.

Hairless pigs are of normal weight and size, perhaps a litle above normal weight; they are generally carried the full gestation period and often four to seven days overtime. When absolutely hairless and born alive they may live a few hours after birth, but always die sooner or later. They are characterized by thick, pulpy necks, thick skin, no squeal, and no vitality. Where perfectly hairless the skin is smooth, shiny, and bald, except for a few hairs around the eyes and nose. The hoofs of hairless pigs are thin-walled and undeveloped. In the same litter there may be variations from pigs with full haired coats and full vigor to pigs with scanty-haired coats and little vitality.. Those with some hair may live if given special attention and care.

Pigs in this condition are more likely to be born from gilts than from old sows. They are more likely to be born in the spring than in the fall.

Goiter is the Cause

The cause of this malady in both sow and young pig is goiter, an enlarged, improperly working thyroid gland. The thyroid gland, at the center and base of the throat, in its enlarged condition accounts for the thick necks of the little pigs. The sow is also suffering from an enlarged thyroid, but this cannot be so readily observed due to the large, fat, fleshy neck. The goiter in the sow does not seriously affect her health and it does not affect her use for meat, but unless corrected it does interfere wtih her breeding functions. The thyroid gland of a normal new-born pib is about the size of a pea, while that of a hairless pigs is the size of a hickery nut. The gland in a normal sow varies in size, but usually is not larger than a walnut, while in a sow producing hairless pigs it is the size of a man's fist.

Studies of goiter in the human race have shown that when the thyroid gland is removed or its functions interfered with, as in goiter or in cancer of the thyroid, the hair and nails cease to develop and the skin of the face and neck becomes thick and pulpy. These conditions correspond very closely with those found in hairless pigs.

The immediate cause of goiter in the human race is not clearly established by medical science but a cure for the simple form has been found in the use of iodine. It is surprising how widely prevalent goiter really is. It is estimated that 85 per cent. of the dogs on the streets of Chicago show more or less enlargement of the thyroid; and goiter or "big neck" is being recognized more frequently in calves, lambs and colts. In the states of Oregon, Washington and Montana considerable losses by big neck in colts have, lambs, and calves have been reported and cases among lambs have been reported in our own state. At one time the sheep raising industry of Michigan was in danger because of goiter in lambs. Before the discovery of salt deposits around the Great Lakes its future seemed hopeless, but with the development of the salt industry and the use of salt by sheep growers goiter rapidly decreased. The salt contained appreciable quantities of idoine. At present the refined rock salts coming from Michigan, as well as from other parts of the United States, do not contain enough iodine to make their use a guarantee of goiter prevention.

Use of Iodine Prevents Hairless Condition

The fact that hairless pigs are the product of a mother suffering from goiter suggested the possibility of curing and controlling this malady with iodine. The thyroid gland forms a chemical substance containing iodine which it circulates thorugh the blood stream. This compound is of the greatest importance to the proper development of an animal. When conditions arise requiring more of this compound, and the iodine supply in the food is not increased, the gland enlarges to let more blood pass through it in a given time. It is, therefore, either a failure to absorb the iodine from the feed or a failure of the thyroid gland to absorb the iodine that is in the blood that causes goiter.

The thyroid gland of the hairless pig contains no iodine; a normal thyroid in its dried state contains about .2 per cent. iodine. The iodine supply in our feeding materials is comparatively low and this is true for all feeding materials. However, in most instances there is enough iodine present in our feeds when it is properly assimilated; but under certain conditions of life, the exact analysis of which is not possible in the present state of our knowledge, our farm animals are unable to absorb sufficient amounts of iodine.

How tao Use Iodine

We have successfully corrected the hairless pig trouble by giving the sow during her entire gestation period 10 grams (approximately 1/3 of an ounce) of potassium iodine per 100 pounds of feed. This material can be procured from almost any drug store. tI should be powdered to a meal as fine as flour, and then mixed with 100 pounds of feed.

There is no way, so far as we know, of telling beforehand whether or not a sow has goiter. But where hairless pigs have occurred on the farm it would be good insurance against their reoccurrence to use potassium iodide. At present prices for this chemical a sow can be carried through the entire gestation period for about 26 cents. Special quack remedies should be avoided; nothing but iodine will do the work and the products of vendors of special drugs should be avoided. This malady is not abortion, but is due to the poor working of the thyroid gland.

Tests of this treatment at the Montana Experiment Station have shown that about half of the amount of potassimu iodide we have used, when fed for 60 days, will prevent hairless pig production. We have not as yet had an oportunity to try the smaller dose, but would recommend that from 5 to 10 grams of potassium iodide (1/3 to 116 of an ounce) per 100 pounds of feed be used. Do not use more as it would be unnecessary and a waste of money. t Ihad better be fed the entire gestatoin period, or at least the last 75 days of gestation, until further experiments have decided whether a shorter period of use would be equally efficient.

Variations in the Malady

This malady is subpect to the greatest variations. Four sows in the same pen, fed the same ration and cared for in identically the same way, may give the following results: Two will come through with sound, normal litters; the third will give a mixed litter, that is, some with a good hair coat and some with scanty hair coat, or absolutely hairless; the fourth will give all hairless pigs. We believe these results are probably due to constitutional differences in the animals, inherent factors which always display themselves with any group of animals. A ration that is near the border line of deficiency in iodine and at the same time is slightly out of balance in some other respect may well affect some individuals more than others.

Again, a farmer may lose 90 per cent. of his spring pisg by this malady and yet that same breeding stock may produce under summer conditions, such as pasture and exercise, good litters in the fall. tI is such conditions as summer pasture and exercise that are important factors in preventing this malady without the use of potassium iodide.

Proper Rearing May Prevent Hairless Pigs

We have reared a considerable number of sows on rations made partly of grains, but with 25 per cent of alfalfa in the ration and under these conditions have never had a case of hairless pigs. They were even confined in pens while on these rations. But when our young stock was started at weaning time on concentrates such as grains and skimmilk, and little or no roughage was used in the ration, hairless pigs often resulted; and there was just as much iodine in one ration as in the other.

Alfalfa or clover hay should form 25 per cent. of the ration. If choice leafy hay is fed in a rack, sows will (usually) eat this proportioni of hay. However, if they do not eat enough of uncut hay to make about 25 per cent. of the ration, the hay may be cut and mixed with the other feed.

An extraordinary outbreak of hairless pigs occurred in the spring of 1917 in areas in Montana not previously affected. There had been a cold, long winter, roughage was scarce and the animals were wintered mainly on grains. nI the spring of 1918, after a mild winter, with practically no snow and plenty of hay, there were almost no cases of hairless pigs in the "unaffected" areas.

In Wisconsin, the spring of 1918 saw some of our breeders experiencing this malady for the first time. The winter had been extremely severe and roughages were scarce among those suffering most. Our experience indicates that the liberal use of roughage and the feeding of rations not excessively high in protein are by far the safest rules to follow in the rearing of gilts for breeding purposes, if the too common occurence of hairless pigs is to be prevented. Farmers should not rely wholly on grains and skimmilk for their breeding gilts. Introduce 25 per cent of the ration as cut alfalfa or clover. This gives bulk to the ration and insures proper elimination of waste through the intestines; it keeps the intestines in a healthy condition and will allow the absorption of sufficient amounts of iodine naturally present in the feed to meet the sow's needs without the use of potassium iodide. Keep the animals dry and provide exercise. Goiter is more prevalent in northern, mountainous districts with cold, long, damp winters and little sunshine, than in the warm climates with plenty of sunshine and opportunity for exercise.

The suggested method of rearing breeding swine may not always prevent goiter—some cases will need the potassium iodide treatment—but we believe proper rearing will go a long way toward solving a growing difficulty in this state. However, if you had hairless pigs in the spring of 1918 it will be advisable to use the potassium iodide treatment this winter.

Summary

Goiter, or an enlarged thyroid gland, the function of which is disturbed, is the cause of hairless pigs. Both sow and young are afflicted with enlarged glands.

The enlarged glands are deficient in iodine, which is essential to the proper action of this gland and the production of normal young.

Iodine, supplied the female breeding stock during the gestation period, will prevent this trouble. One-third to one-sixth of an ounce of potassium iodine to each 100 pounds of feed will prevent hairless pigs. Do not use more.

Rearing the breeding sows with plenty (25 per cent.) of good roughage, such as alfalfa or clover hay, in the ration and not an excessive amount of protein may do much toward preventing this trouble and thus avoid the necessity for using the potassium iodide treatment later.—Wisconsin Bulletin No. 297.

Explanations of Illustrations

Accompanying this article in bulletin form are several illustrations which are not available. Figure 1 shows " Dead Hairless Pigs." Figure 2 shows "A Mixed Litter of Haired and Hairless Pigs." Figure 3 shows "An Instance of Correction with Potassium Iodide." Figure 4 shows "A Gilt raised so as to Help in the Prevention of Hairless Pigs."

In reference to Figure 1 the authors say: Note the thick necks indicating a goitrous condition. The mother of these pigs had been started on a grain ration high in protein and no roughage. On this ration she did not thrive well and was changed to one consisting of 15 parts of alfalfa, 25 parts of oats, 25 parts of middlings, and 10 parts of oil meal. She had produced two littlers of hairless pigs on this ration before being changed to the ration of 33 parts of clover, 33 of corn and 33 of oats on which she again produced hairless pigs. This trouble was corrected in this same sow by the use of potassium iodide.

In regard to Figure 2 it is said that a sow may produce a litter in which there are both haired and hairless pigs. The hairless ones are dead, while those with the hair will show life and may be raised. This sow grew up on a ration of 30 parts of corn, 30 of oats, 30 of middlings, 8 of oil meal and 1 of tankage. She was under strictly confined conditions but appeared normal in every other respect, excepting in reproduction.

Figure 3 shows the same sow as in Figure 2 on the same ration, but to which was added 10 grams of potassium iodide to each 100 lbs. of feed. All the young were born alive and in normal condition.

In regard to Figure 4 the authors say: We believe that hairless pig production is often the result of improper feeding of young sows, such as giving them too high protein feeds and too little roughage in the ration. This sow was reared on a ration of 15 parts of corn and 25 of alfalfa. While the sow may grow at a somewhat slower rate than normal, yet the litters have always been haired and strong where sows have been reared on a ration containing 15 to 26 per cent. of roughage.

HORTICULTURE.

STORAGE LOSSES IN APPLES DUE TO FUNGI

Storage losses are generally explained as the result of improper storage conditions. This is no doubt to some degree correct, and when the losses occur in cold storage houses something is genrally amiss and neglect has occurred in maintaining proper conditions. But one must ask: Do apples which are properly stored, not suffer from rot? The answer is simple enough. Apples will keep almost indefinitely up to the time when a slow maturing process—which is a chemical process, changes the composition and natural collapse of the fruit takes place, providing they are absolutely sound when placed in storage.

The losses in storage amount annually to many thousands of barrels, simply because showing blemishes of one kind or another are stored with sound ones. The apple scab is one of the most common agents givnig rise to decay of fruit kept in storage. As long as the temperature of the cold storage is kept low—about 32 degress F. or close by—no rot is likely to show. But should such apples reach the vendor or the consumer the trouble will begin as soon as the temperature changes. Any injured or scabby surface of an apple is quickly invaded by the common fungi such as pink rot, blue mould, etc., and once these fungi commence their destructive work, a barred of apples is often destroyed more quickly than it could be eaten by an average-sized family. As soon as the rot is observed in a barrel, prompt action is called for. Out with all the apples; throw the bad ones right out, save what can be saved of partly spoiled fruit for immediate use, wipe the sound ones with a dry cloth and store them in a well ventilated but cool place, examining them from time to time. One rotten apple in a barrel will start all the others to rot in no time.

From the above it will be seen that, while improper storage conditions—and once in the hands of the consumer a barrel of apples will rarely find proper, i. e. cool, well ventilated, but particularly uniform temperatures—have some influence in starting the rot, if the apples are in good condition when placed in storage, the consumer will not so likely be the loser—as he benerally is. The time will come when the consumer will be allowed to deduct from his bills the losses which are due to the negligence of others, particularly at a time when high prices prevail.

CARE OF HOUSE PLANTS

In caring for house plants it should b eborne in mind that they are of two classes and that such plants as ferns, palms and the rubber plant will do better in those parts of the room where the light is limited, while floweriny plants, such as geraniums, tulips, narcissi and cyclamen, must hape as much light as possible. Plants are more like human beings than like bric-a-brac and if grown to brighten the home during dull winter months they must not be left to take care of themselves or they will soon fail to fulfill the purpose of the ir presence.

There are not a large number of successful house plants and those which experience has shown are best suited ofr the purpose demand certain definite conditions. The fundamental condition relates to the atmosphere of the room. If this is suitable even the soil is of secondary importance. The atmosphere must be kept at a suitable temperature and also, for success, must contain plenty of moisture. A dry atmosphere, even when plants are well watered, is fatal to good growtth. Regular watering is another important factor for success.

Plants wil lgrow better in houses heated by hot water than they will in those heated by hot air or steam. The latter systems absorb the moisture from the atmosphere with the result htat the plant either loses some of iits leaves by withering or fail sto make healthy growth. Pans of water stood on the radiators to give off moisture always improve the conditions for the plants. The blooms will last longer when the atmosphere is kept somewhat cool and moist. The ideal temperature rangs from about 50° to 70°. Higher temperature necessitates more frequent waterings. Some plants need to be watered daily, others not more than two or three times a week. A pot which rings hollow when tapped with the knuckles needs water. Over watering is bad for plants and only one or two varietise, like the spirea, will succeed if the pots are allowed to stand in water. All pots should be supplied with good drainage in the form of broken crocks filled in at the bottom of the pot when the plants are potted.

Fresh air is always beneficial, but not in the form of direct draughts. A temperature of 40° or lower will ofetn seriously affect the tender house plants. Palms and ferns are the better for sponging once or twice a month. Never water a sickly plant too freely; it more often requires to be repotted. Healthy plants will be benefitted by a yearly repotting. Healthy plants and plants in ower require much more water than those which are sickly. Soil should not be watered so often that it becomes soggy and always cold. A plant with cold feet and a hot head soon dies.

FALL SPRAYING OF ORCHARDS

An increasing number of the most experienced orchardists throughout the middle states and New England will apply the dormant spray to their orchards late in autumn or early winter. This practice has given better results dormant spraying in Morch or April, which has generally been the custom heretofore. The San Jose scale seems to increase and multiply during the warmer days in winter. If autumn spraying is thoroughly done with the rigth stuff, it sticks on until he new leaves are well developed and thus prevents San Jose scale from breeding or multiplying in either winter or spring.

Whether scalecide or other miscible oil sprays are used, or lime sulphur, spraying of the apple or peach may be done any time after the leaves have falle nin November or December when the temperature is well above freezing. Usually the ground is then dry and firm, so that the team and spray rig can get over the orchard more easily than in spring when thaw makes the ground muddy, if not impassible.

Another vital advantage in dormant spraying in late autumn is that on most fruit farms work is then less pressing. Even if help is scarce, it will be possible to get the spraying done in the slack time of November. But if this job is put off until next spring, when the help question may be even more serious, one may not be able to spray at all.

,For this reason also it pays to have a good spray rig with all modern improvements. My neighbor spent $700 for a power sprayer, which it first seemed extravagant, but it is proving the greates labor saver and money maker ha has ever had in his peach and apple orchard. Another labor-saver and money maker is the low-down tractor for plowing or cultivating orchards. With it one man can work as many acres of orchard as two or three men, each with a two-horse team. Fruit growers, like other farmers, have got to use these devices or quit the game, if hired labor is unobtainable.

APPLES IN STORE

Below is given an estimate of the apples in store at the following points on December 31, 1918. These figures will, of course, vary from day to day as shipments are made:—

Nova Scotia	150,000	
Halifax, N.S.	1,300	
Quebec, P.Q.	6,500	6,000
Montreal, P.Q.	19,800	11,17g
Ottawa, Ont.	9,000	3,000
Brighton, Ont.	4,000	
Colborne, Ont.	6,000	
Oshawa, Ont.	7,000	
Toronto, Ont.	6,000	23,000
Winnipeg, Man.	9,000	39,000
Calgary Alta.		13,650
Edmonton, Alta.		9,100
Nelson District, B.C.		15,980
Penticton, B.C.		4,900
Summerland, B.C.		19,800
Kelowna, B.C.		5,600
Vernon, B.C.		11,000
Salmon Arm, B.C.		2,500
Vancouver, B.C.		47,500
Victoria, B.C.		13,070

C. W. BAXTER,
Commissioner.

A VISIT TO THE EXPERIMENTAL STATION, FREDERICTON

A sort time ago we had the pleasure of a visit to the Experimental Farm at Fredericton. A ramble through the spacious stables found every animal therein sheltered in the pink of condition. Never have we seen the cows, heifers and calves on the Station farm look so well. There are some very promising young stock coming on. An interesting experiment is being conducted in the upgrading of a dairy herd by the use of pure bred sires with common scrub cows as the foundation. Several of the first cross heifers are now milking. Some of them are better producers than their dams, while in other cases they do not tally u pto the pace set by their dams. The foudnation has already been laid for a particularly nice herd of dairy Shorthorns. The milk flow furnished by thes egrand dams would make a very good cow of the recognized dairy breeds green with envy. Bulls from particularly heavy milkers are being used to head the herd and we look forward to see Supt. Hubbard realize his ambition to have a barn well filled with milking Shorthorns that are milkers indeed.

He has a strong right bower to help him attain this end in Mr. John Bennett, his herdsman, who was for many years in charge of the R. A. Snowball herd at Chatham. Mr. Bennett heard his Country's call and donned the King's uniform. On his return he accepted the position of herdsman at the Experimental Station. Under his experienced guidance as breeder and feeder the Station herd will have every chance to make good.

FROM THE DOMINION EXPERIMENTAL FARMS, 1918-19
DISTRIBUTION OF SEED GRAIN

By instructions of the Hon. Minister of Agriculture, a free distribution of superior sorts of grain will be made the coming winter and spring to Canadian farmers.

The samples for distrbution of spring wheat (about 5 lb.), white oats (about 4 lb.), barley (about 5 lb.) and field peas (about 5 lb.). These will be sent out, freefi by mail, from the Central Experimental farm, Ottawa, by the Dominio nCerealist, who will furnish the necessary application forms.

Only one sample can be sent to each applicant. As the supply of seed is limited, the ar eadvised to apply very early.

J. H. GRISDALE,
Director, Dominion Experimental Farms

Peace does not alter the food demands upon Canada and the United States, but in fact increases the load and the demand for economy.

Fruit Packages

We Manufacture Strawberry Boxes and Crates for same, 6 qt. Baskets, Apple Boxes, Box Shooks, Apple Graders, Wheelbarrows.. Now is the time to lay in a supply of Fruit Packages for the coming season. We have a good stock on hand, order early and ensure prompt shipment.. Price on application to

Hantsport Fruit Basket Co., Ltd.

HANTSPORT, N. S.

FIELD ROOT SEED SUPPLY FOR 1918

About the first of July, 1917, the Dominion Department of Agriculture was advised that Canada might face a shortage in the field root seed supply needed in 1919. In view of this the Dominion Experimental Farms system was requestd to take immediate action to raise, in 1918, considerable quantities of the said seed.

Accordingly, seed of best stock available of a number of varieties was immediately secured and placed with a number of Dominion Experimental Farms and Stations in Eastern Canad, Alberta and British Columbia.. A number of farmers were also found who were ready and willing to undertake the growing of seed on their farms.

We have just received from Dr. M. O. Malt, Dominion Agrostologist, Central Experimental Farm, Ottawa, a list giving the approximate quantities of seed available for sale of mangels, Swede Turnips and Carrots produced by the Dominion Experimental Farms system in 1918, and also a copy of conditions of sale of the same.

FIELD ROOT SEED FOR SALE

Mangels

Yellow intermediate from selected stock developed at Central Experimental Farm, Ottawa, seed grown at Central Experimental Farm, 9000 pounds

Grant Yellow Intermediate, from seed secured from Steele Briggs Seed Company, Toronto. Seed grown at Central Experimental Farm, Ottawa 5,000 pounds.

Seed grown at Dominion Experimental Station, Lethbridge, Alta., 1000 lbs.

Half Sugar White, from selected stock developed at Central Experimental Farm, Ottawa. Seed grown at Central Experimental Farm, 300 lbs.

Half Sugar White, from John A. Bruce & Co., Hamilton, Ont., (in their seed catalogue under the name of Bruce's Grant White Feeding Sugar.) Seed grown at Dominion Experimental Farm, Agassiz., B. C., 1000 lbs.

Seed grown at Dominion Experimental Station Summerland, B. C., 7,000 lbs.

Danish Sludstrup from selected stock produced from J. M. Steeves, Steveston, B. C. Seed grown at Agassiz, 500 pounds.

Danish Sludstrup, from selected stock developed at Dominion Experimental Station, Kentville, N. S. Seed grown at Dominion Experimental Station, Kentville, 500 pounds.

Swede Turnips

Purple Top Swede, from ordinary stock grown at Central Experimental Farm, 2,000 lbs.

Monarch, from selected stock secured from D. M. Ferry Company. Seed grown at Dominion Experimental Farm, Nappan, N. S., 7,000 lbs.

Canadian Gem, from stock secured from Wm. Rennie Seed Company. Seed grown at Kentville, N. S., 8,000 lbs.

Kentville Green Top, from selected stock developed and seed grown at the Experimental Station, Kentville, 1,800 lbs.

Sutton's Champion, from selected stock secured from D. M. Ferry Co. Seed grown at Experimental Station Fredericton, N. B., 800 lbs.

Carters Imperial, from stock secured from Dupup & Ferguson. Seed grown at the Dominion Experimental Station, Ste. Anne de la Pactiere, Que., 900 lbs.

Carrots

Danish Champion, from selected stock developed and seed grown at the Central Experimental Farm, 900 lbs.

White Intermediate, from Stock secured from Kenneth McDonald & Son. Seed grown at the Dominion Experimental Station, Summerland, 3,000 lbs.

White Belgian, from stock secured from Kenneth McDonald & Son. Seed grown at the Dominion Experimental Station, Sidney, B. C., 300 lbs.

Conditions of Sale

Mangel Seed in sacks, sewed, in net weights of ten pounds and twenty five pounds, equal total weight of each, i. e., five sacks of ten pounds supplied wit heach two sacks of twenty-five pounds—75 cents per pound.

Swede Turnip Seed in cotton sacks, sewed, in net weights of ten pounds each—$1.15 a pound.

Carrot Seed in cotton sacks, sewed, in net weights of five pounds each—$1.50 a pound.

,All sacks included in the prices quoted.

A commission of ten cents per pound will be allowed to Central Farmers Organizations ,the same to cover all expenses of reshipment and prepayment of freight from headquarters of Central Farmers' Organizations to Local Farmers' Organization of Farmers; the said ten cents per pound to be deducted from the prices afeorementioned. Railway freight charges to headquarters of Central Farmers' Organizations to be paid by the Central Experimental Farm, net payment by bank at sixty days from date of shipment.

A discount of 20% on the aforesaid prices will be allowed if the seed is supplied F.O.B. Ottawa, as follows:

Mangel Seed in 50 lb. jute sacks sacks; Swede Turnip Seed in 100 lb. cotton sacks; Carrot Seed in 50 lb. cotton sacks; sight draft to accompany bil lof lading. ,

Minimum orders accepted: Mangel seed, 100 lbs.; Swede Turnip Seed, 100 lbs.; aCrrot seed, 50 lbs.

Orders will be accepted provided the stock has not been sold at the time of receipt of order of the varieties specified. However, in case of extreme demand the right is reserved to fill orders pro rata, according to requirements as indicated by Government Seed survey. All shipments to be made by March first.

Dr. M. O. Malte, Dominion Agrostologist, Ottawa, will receive the orders.

A glance at the foregoing quantities of seed ofr sale will show that in the number of pounds of seed grown, the Experimental Station at Kentville, N. S., tops the list. Well done Superintendent Blair.

CONTROL OF WEED SEED IN THE CLOVER

While there are only a few kinds of weed seeds which are commonly found in red clover seed in quantities sufficient to cause it to be prohibited from sale under "The Seed Control Act," it is yet very nuecessary that the seed for sowing be as pure as possible. It is not easy to say how much damage to soil, and injury to live stock, may be caused by impurities in red clover seed. For this reason "Pamphlet S-2" prepared by the Dominion Seed Analyst, and just issued by the Seed Branch of the Department of Agriculture, Ottawa, is one that should command wide and general attention from farmers. "The Seed Control Act" prohibits the sale of red clover seed if it contains more than 80 seeds of noxious weeds or 400 of all kinds of weed seeds per ounce. The pamphlet referred to, which can be had free on application to the Publications Branch, Ottawa, tells of the maximum number of weed seeds per ounce that are permitted in the different crops of timothy, red clover, alfalfa, and alsike, and describes with exactitude, the steps that are necessary to purify the seed. Information is given of the relative prevalence of weed seeds; of the method of eradication of weeds, as regards testing, and instructions for taking and sending to the Branch to be tested. A series of exact illustrations of sieves necessary for their removal are given in the pamphlet.

FOR MAPLE SYRUP AND SUGAR

Every maker of Maple goods in Eastern Canada should be interested in this remarkable contest. Our last competition before the war showed us how to arrange the prize money so that more competitors will be sure of being in the winning class. This Spring will offer an unprecedented opportunity in the development of the Maple industry and this contest will help to classify and arrange the various grades and qualities of Syrups and Sugars produced in Canada. Why not equip your grove and enter this contest, For full particulars, write to

HIS FIRST EXPERIENCE WITH GROUND LIMESTONE

W. E. CcLaughlin, of Kings Co., speaking of his first experience with ground limestone, said at a recent farmers' meeting:

In the spring of 1915 I applied ground lime stone at the rate of two tons per acre to a field from which I had never been able to get a crop of hay. lime stone was applied early in the spring and was harrowed in with the grain and grass seed. I got a good catch of clover and have cut three bumper crops of hay in the summers of 1916, 1917, and 1918, without the expenditure of a single dollar in fertilizers of any kind. The ground lime stone cost me $2.10 per ton at the government lime stone pulverizing machine when working for farmers in the vicinity of Sussex.

A somewhat similar testimony was giben in our hearing a few days ago by Mr. Irvine R. Alward, of Havelock, Kings Co. Let us have your experience with ground lime stone or lime of any kind. We would also like to get sort notes in drainage experiences for these columns.

POULTRY.

DAIRY STATISTICS

Ottawa, January 3, 1919—The Dominion Bureau of Statistics has issued a preliminary bulletin giving the statistics of creameries and cheese factories for the year 1917 as collected by the Bureau in cooperation with the Provincial Governments and as compiled by the Bureau. A complete report on the subject is in preparation and will be published as Part II of the Report on the Census of Industry.

Number of Factories and Patrons

The report shows that the total number of creameries and cheese factories making returns in Canada in 1917 was 3,418, as compared with 3,446 in 1916 and 3,513 in 1915. Of the total in 1917, 949 are creameries, 1,900 are cheese factories, 549 are combined factories making butter and cheese and 20 are condensed milk factories. The great majority both of creameries and cheese factories are in Quebec and Ontario. In Quebec there are 598 cerameries, 895 cheese factories, 482 combined factories and 1 condensed milk factory. In Ontario creameries number 154, cheese factories 923, combined factories 45 and condensed milk factories 13. In both of these provnices the number of cheees factories has increased, and the number of creameries has decreased, as compared with 1916. The total number of patrons (i. e. farmers supplying milk and cream) is 250,505 in 1917 as compared with 221,192 in 1916 and 212,927 in 1915. In 1917, the patrons numbered 81,784 in Quebec and 96,255 in Ontario.
